The excitement had its root in the uneasy feeling caused by the knowledge that the heir to the throne was a Roman Catholic.

Three parliaments were summoned and dissolved. In each parliament the main question at issue between the Commons and the crown was the Exclusion Bill, by which the Commons sought to deprive the duke of York of his inheritance; and it was notorious that the leaders of the movement wished the crown to descend to the king's illegitimate son, the duke of Monmouth.

The principles by which the Commons were guided in these parliaments were very different from those which had prevailed in the first parliament of the Restoration. Those principles, to which fair triers of impartial courts had been adhered to, this time became known as the Tory party, had been formed under the influence of the terror caused by militant Puritanism. In the state the Tory inherited the ideas of Clarendon, and, without being at all ready to abandon the claims of parliaments, nevertheless somewhat inconsistently spoke of the king as ruling by a divine and indefeasible title, and wielding a power which it was both impious and unconstitutional to resist by force. In the church he inherited the ideas of Laud and saw in the maintenance of the Act of Uniformity the safeguard of religion. But the hold of these opinions on the nation had been weakened with the cessation of the causes which had produced them. In 1660 twenty years had passed since the Puritan army had been disbanded. Many of Cromwell's soldiers had died, and most of them were growing old. The dissenters had shown no signs of engaging in plots or conspiracies. They were known to be only a comparatively small minority of the population, and though they had been cruelly persecuted, they had suffered without a thought of resistance. Dread of the dissenters, therefore, had become a mere chimera, which only those could entertain whose minds were influenced by prejudice. On the other hand, dread of the Roman Catholics was a living force. Unless the law were altered a Roman Catholic would be on the throne, wielding all the resources of the prerogative, and probably supported by all the resources of the king of France. Hence the leading principle of the Whigs, as the predominant party was now called, was in the state to seek for the highest national authority in parliament rather than in the king, and in the church to adopt the rational theology of Chillingworth and Hales, whilst looking to the dissenters as allies against the Roman Catholics, who were the enemies of both.

Events were to show that it was a wise provision which led the Whigs to exclude the Jacobites from the throne. But their plan suffered under two faults, the conjunction of which was ruinous to them for the time. In the first place, their choice of Monmouth as the heir was injudicious. Not only was he under the stain of illegitimacy, but his succession excluded the future succession of Mary, whose husband, the prince of Orange, was the hope of Protestant Europe. In the second place, drastic remedies are never generally acceptable when the evil to be remedied is still in the future. When, in the third of the short parliaments held at Oxford, the Whigs rode armed into the city, the nation decided that the future danger of a Roman Catholic succession was incomparably less than the immediate danger of another civil war. Loyal addresses poured in to the king. For the four remaining years of his reign he ruled without inspiring any parliament. Whigs were brought before prejudiced juries and partial judges. Their blood flowed on the scaffold. The charter of the city of London was confiscated. The reign of the Tories was unquestioned. Yet it was not quite what the reign of the Cavaliers had been in 1660. The violence of the Restoration had been directed primarily against Puritanism, and only against certain forms of government so far as they allowed Puritans to gain the upper hand. The violence of the Tories was directed against rebellion and disorder, and only against dissenters so far as they were believed to be the foremen of disorder. Religion and hatred had less part in the action of the ruling party, and even from its worst actions a wise man might have predicted that the day of toleration was not so far off as it seemed.

The accession of James II. (1685) put the views of the opponents of the Exclusion Bill to the test. A new parliament was elected, almost entirely composed of decided Tories. A rebellion in Scotland, headed by the earl of Argyll, and a rebellion in England, headed by the duke of Monmouth, were easily suppressed. But the inherent difficulties of the king's position were not thereby overcomed. It would have been hard, in days in which religious questions occupied so large a space in the field of politics, for a Roman Catholic sovereign to rule successfully over a Protestant nation. James set himself to make it, in his case, impossible. It may be that he did not consciously present to himself any object of his own, but it was the case of his courtiers, under the pretext of the danger of a repetition of the late rebellion; and in the regiments thus levied he appointed many Roman Catholic officers who had refused to comply with the Test Act. Rather than submit to the gentlest remonstrance, he postponed parliament, and proceeded to obtain from the court of king's bench a judgment in favour of his right to dispense with all penalties due by law, in the same way that his grandfather had appealed to the judges in the matter of the post-nati. But not only was the question put by James II. of far wider import than the question put by James I., but he deprived the court to which he applied of all moral authority by previously turning out of office the judges who were likely to disagree with him, and by appointing new ones who were likely to agree with him. A court of high commission of doubtful legality was subsequently erected (1686) to deprive or suspend clergymen who made themselves obnoxious to the court, whilst James appointed Roman Catholics to the headship of certain colleges at Oxford. The legal support given him by judges of his own selection was fortified by the military support of an army collected at Hounslow Heath; and a Roman Catholic, the earl of Tyrconnel, was sent as lord-deputy to Ireland (1687) to organize a Roman Catholic army on which the king might fall back if his English forces proved insufficient for his purpose.

This led to a declaration of indulgence (1685) granting full religious liberty to all his subjects. The belief that the grant of liberty to all religions was only intended to serve as a cloak for the ascendency of one, was so strong that the measure roused the opposition of all those who objected to see the king's will substituted for the law, even if they wished to see the Protestant dissenters tolerated. In spite of this opposition, the king thought it possible to obtain a parliamentary sanction for his declaration. The parliament to which he intended to appeal was, however, to be as different a body from the parliament which met in the first year of his reign as the bench of judges which had approved of the dispensing power had been different from the bench which existed at his accession. A large number of the borough members were in those days returned by the corporations, and
the corporations were accordingly changed. But so thoroughly
was the spirit of the country roused, that many even of the new
corporations were set against James's declaration, and he had
therefore to abandon for a time the hope of seeing it accepted
even by a packed House of Commons. All, however, that he
could do to give it force he did. He ordered the clergy to read
it in all pulpits (1688). Seven bishops, who presented
a petition asking him to relieve the clergy from the
burthen of proclaiming what they believed to be
illegal, were brought to trial for publishing a seditious
libel. Their acquittal by a jury was the first serious blow to the
system adopted by the king.

Another event which seemed likely to consolidate his power
was in reality the signal of his ruin. The queen bore him a son.

There was thus no longer a strong probability that
the king would be succeeded at no great distance of
time by a Protestant heir. Popular insecurity ex-
pressed itself in the assertion that, as James had attempted to
gain his ends by means of a packed bench of judges and a packed
House of Commons, he had now capped the series of falsifications
by the production of a supposititious heir. The leaders of both
parties combined to invite the prince of Orange to come to the
rescue of the religion and laws of England. He landed on the
5th of November at Brixham. Before he could reach London
every class of English society had declared in his favour. James
was deserted even by his army. He fled but in so doing had endangered
the very existence of parliament, summoned without the royal writ, declared
that his flight was equivalent to abdication, and offered the crown
in joint sovereignty to William and Mary (1689).

IX. THE REVOLUTION AND THE AGE OF ANNE

1689-1714

The Revolution, as it was called, was more than a mere change
of sovereigns. It finally transferred the ultimate decision in
the state from the king to parliament. What parliament
had been in the 15th century with the House of
Lords predominating, that parliament was to be again
in the end of the 17th century with the House of
Commons predominating. That House of Commons was far
from resting on a wide basis of popular suffrage. The county
voters were the freeholders; but in the towns, with some
important exceptions, the electors were the richer inhabitants
who formed the corporations of the boroughs, or a body of select
householders more or less under the control of some neighbouring
landowner. A House so chosen was an aristocratic body,
but it was aristocratic in a far wider sense than the House of Lords
was aristocratic. The trading and legal classes found their
representation there by the side of the great owners of land.
The House drew its strength from its position as a true represent-
ative of the effective strength of the nation in its social and
economical organization.

Such was the body which firmly grasped the control over every
branch of the administration. Limiting in the Bill of Rights
the powers assumed by the crown, the Commons declared that
the king could not keep a standing army in time of peace without
consent of parliament; and they made that consent effectual,
as far as legislation could go, by passing a Mutiny Act year by
year for twelve months only, as by granting a large part of
the revenue only for a limited term of years, and by putting
strictly in force their right of appropriating that revenue to
special branches of expenditure.

Such a revolution might have ended in the substitution of the
despotism of a class for the despotism of a man. Many causes
combined to prevent this result. The landowners, who formed
the majority of the House, were not elected directly, as was
the case with the nobility of the French states-general, by their
own class, but by electors who, though generally loyal to them,
would have broken off from them if they had attempted
to make themselves masters of their fellow citizens.

No less important was the almost absolute inde-
pendence of the judges, begun at the beginning of
the reign, by the grant of office to them during good behaviour
instead of during the king's pleasure, and finally secured by the
clauses in the Act of Settlement in 1701, which protected them
against dismissal except on the joint address of both Houses of
Parliament. Such an improvement, however, finds its full
counterpart in another great step already taken. The more
representative a government becomes, the more necessary it is
for the well-being of the nation that the expression of individual
thought should be free in every direction. If it is not so, the
government is inclined to proscribe unpopular opinion, and to
forget that new opinions by which the greatest benefits are likely
to be conferred are certain at first to be entertained by a very
few, and are quite certain to be unpopular as soon as they come
into collision with the opinions of the majority. In the middle
ages the benefits of the liberation of thought from state control
had been secured by the antagonism between church and state.
The Tudor sovereigns had rightfully asserted the principle that
in a well-ordered nation only one supreme power can be allowed
at the same time to make and execute the laws. It was
fortunate that, just at the moment when parliamentary control
was established over the state; circumstances should have arisen
which made the majority ready to restore to the individual
conscience that supremacy over religion which the medieval
ecclesiastics had claimed for the corporation of the universal
church. Dissenters had, in the main, stood shoulder to shoulder
with churchmen in rejecting the suspicious benefits of James,
and the spirit of gratitude and policy forbade the thought of replacing
them under the heavy yoke which had been imposed on them
at the Restoration. The exact mode in which relief should be
afforded was still an open question. The idea prevalent with the
more liberal minds amongst the clergy was that of compre-
hension—that is to say, of so modifying the prayers and cere-
monies of the church as to enable the dissenters cheerfully to enter
in. The scheme was one which had approved itself to minds
of the highest order—to Sir Thomas More, to Bacon, to Hailes
and to Jeremy Taylor. It is one which, as long as beliefs are not
very divergent, keeps up a sense of brotherhood overruling
the diversity of opinion. It broke down, as it always will break
down in practice, whenever the difference of belief is so strongly
felt as to seek earnestly to embody itself in diversity of outward
practice. The greater part of the clergy of the church felt that
to surrender their accustomed formularies was to surrender
somewhat of the belief which those formulations signified, while
the dissenting clergy were equally reluctant to adopt the common
prayer book even in a modified form. Hence the
Toleration Act, which guaranteed the right of separate
assemblies for worship outside the pale of the church,
though it embodied the principles of Cromwell and
Milton, and not those of Chillingworth and Hailes, was carried
without difficulty, whilst the proposed scheme of comprehension
was not only thrown out of the hands of the king, but the
posterity can heartily approve. However wide the limits of
toleration be drawn, there will always be those who will be left
outside. By religious liberty those inside gain as much as those
who are without. From the moment of the passing of the
Toleration Act, no Protestant in England performed any act
of worship except by his own free and deliberate choice. The
literary spokesman of the new system was Locke. His
Letters Concerning Toleration laid down the principle which had
been maintained by Cromwell, with a wider application than
was possible in days when the state was in the hands of a mere
minority only able to maintain itself in power by constant
and suspicious vigilance.

One measure remained to place the dissenters in the position of
full membership of the state. The Test Act excluded them from
office. But the memory of the high-handed proceedings of Puritan elders was still too recent to allow Englishmen to run the risk of a reimposition of their yoke, and this feeling, fanciful as it was, was sufficient to keep the Test Act in force for years to come.

The complection of the Toleration Act was the abolition of the censorship of the press (1695). The ideas of the author of the 

Apologeticus had at last prevailed. The attempt to fix certain opinions on the nation which were pleasing to those in power was abandoned by king and parliament alike. The nation, or at least so much of it as cared to read books or pamphlets on political subjects, was acknowledged to be the supreme judge, which must therefore be allowed to listen to that counsellors it pleased.

This new position of the nation made itself felt in various ways. It was Wilham's merit that, fond as he was of power, he recognised the act that he could not rule except so far as he carried the goodwill of the nation with him. No doubt he was helped to an intelligent perception of the new situation by the fact that, as a foreigner, he cared far more for carrying on war successfully against France than for influencing the domestic legislation of a country which was not his own, and by the knowledge that the conduct of the struggle which lasted till he was able to treat with France on equal terms at Ryswick (1697) was fairly trusted to his hands. Nevertheless these years of war called for the united action of national government, and in seeking to gain this support he himself, hit upon an expedient which opened a new chapter in constitutional politics.

The supremacy of the House of Commons would have been an evil of no common magnitude, if it had made government impossible. Yet this was precisely what it threatened to do. Sometimes the dominant party in the House was unscrupulous in rancour upon its opponents. Sometimes the majority shifted from side to side as the House was influenced by passing gusts of passion or sympathy, so that it was said at the time, no man could forget one day what the House would be pleased to do on the next. Against the first of these dangers William was to a great extent able to guard by the exercise of his right of dissolution, so as to appeal to the constituencies, which did not always share in the passions of their representatives. But the second danger could not be met in this way. The only cure for waywardness is responsibility, and not only was this precisely what the Commons was, as it was said, 'learned to feel it was that which it was impossible to make them feel directly. A body composed of several hundred members cannot carry on government with the requisite steadiness of action and clearness of insight. Such work can only be entrusted to a few and whenever difficult circumstances arise it is necessary that the action of those few be kept in harmony by the predominance of one. The scheme on which Wilham hit, by the advice of the earl of Sunderland, was that which has since been known as cabinet government. He selected a number the leading members of the two Houses who had the confidence of the majority of the House of Commons. In this way, the majority felt an interest in supporting the men who embodied their own opinions, and fell in turn under the influence of those who held them with greater prudence or ability than fell to the lot of the average members of the House. All that William doubtless intended was to acquire a ready instrument to enable him to carry on the war with success. In reality he had refounded, on a new basis, the government of England. His own personal qualities were such that he was able to dominate over any set of ministers; but the time would come when there would be a sovereign of inferior powers. Then the body of ministers would step into his place. The old rude arrangements if the middle ages had provided by frequent depo-

positions that an inefficient sovereign should cease to rule, and that arrangements had been imitated in the cases of Charles I. and James I. Still the claim to rule had, at least from the time of Henry II., been derived from hereditary descent, and the interruption, however frequently it might occur, had been regarded as something abnormal, only to be applied where there was an absolute necessity to prevent the wielder of executive authority from setting at defiance the determined purpose of the nation. After the Revolution not only had the king's title been so endangered as to make him more remote than ever dependent on the nation, but he now called into existence a body which derived its own strength from its conformity with the wishes of the representatives of the nation.

For the moment it seemed to be but a temporary expedient. When the war came to an end, the Whig party which had sustained William in his struggle with France split up. The dominant feeling of the House of Commons was no longer the desire to support the Crown against a foreign enemy, but to make government as cheap as possible, leaving future dangers to the chances of the future. William had not so understood the new invention of a united ministry as binding him to take into his service a united ministry of men whom he regarded as fools and knaves. He allowed the Commons to reduce the army to a skeleton, to question his actions, and to treat him as if he were a cipher. But it was only by slow degrees that he was brought to acknowledge the necessity of choosing his ministers from amongst the men who had done these things.

The time came when he needed again the support of the nation. The death of Charles II., the heirless king of the huge Spanish monarchy, had long been expected. Since the peace of Ryswick, William and Louis XIV. had come to terms by two successive partition treaties for a division of those vast territories in such a way that the whole of them should fall into the hands of a near relation either of the king of France or of the emperor, the head of the house of Austria. When the king of Spain actually died in 1700, William seemed to have no authority in England whatever; and Louis was therefore encouraged to break his engagements, and to accept the whole of the Spanish inheritance for his grandson, who became Philip V. of Spain. William saw clearly that such predominance of France in Europe would lead to the development of pretensions unbearable to other states. But the House of Commons did not see it, even when the Dutch garrisons were driven by French troops out of the posts in the Spanish Netherlands which they had occupied for many years (1701). William had prudently done all that he could to conciliate the Tory majority. In the preceding year (1700) he had given office to a Tory ministry, and he now (1701) gave his assent to the Act of Settlement, which secured the succession of the Electors of the crown of England to Hanover, daughter of James I.'s daughter Elizabeth, to the exclusion of all Roman Catholic claimants, though it imposed several fresh restrictions on the prerogative. William was indeed wise in keeping his feelings under control. The country sympathized with him more than the Commons did, and when the House imprisoned the gentlemen deputed by the freeholders of Kent to present a petition asking that its loyal addresses might be turned into bills of supply, it simply advertised its weakness to the whole country.

The reception of this Kentish petition was but a foretaste of the discrepancy between the Commons and the nation, which was to prove the marked feature of the middle of the century now opening. For the present the House was ready to give way. It requested the king to enter into alliance with the Dutch. William went yet further in the direction in which he was urged. He formed an alliance with the emperor, as well as with the Netherlands, to prevent the union of the crowns of France and Spain, and to compel France to evacuate the Netherlands. An unexpected event came to give him all the strength he needed. James II. died, and Louis acknowledged his son as the rightful king of England. Englishmen of both parties were stung to indignation by the insult. William dissolved parliament, and the new House of Commons, Tory as it was by a small majority, was eager to support the king. It voted men and money according to his wishes. England was to be the soul of the Grand Alliance against France. But before a blow was struck William was thrown from his horse. He died on the 8th of March 1702. "The man," as Burke said
of him, "was dead, but the Grand Alliance survived in which King William lived and reigned."

Upon the death of Anne, war was at once begun. The Grand Alliance became, as William would have wished, a league to wrest the whole of the Spanish dominions from Philip, in favour of the Austrian archduke Charles. It formed a chief of supreme military and diplomatic genius in the duke of Marlborough. His victory at Blenheim (1704) drove the French out of Germany. His victory of Ramillies (1706) drove them out of the Netherlands. In Spain, Gibraltar was captured by Rooke (1704) and Barcelona by Peterborough (1705). Prince Eugene relieved Turin from a French siege, and followed up the blow by driving the besiegers out of Italy.

The influence of Marlborough at home was the result partly of the prestige of his victories, partly of the dominating influence of his strong-minded duchess ("Mrs Freeman") over the queen (see Anne, queen of England). The duke cared little for home politics in themselves; but he had his own ends, both public and private, to serve, and at first gave his support to the Tories, whose church policy was regarded with favour by the queen. Their efforts were directed towards the restriction of the Toleration Act within narrow limits. Many dissenters had evaded the Test Act by partaking of the communion in a church, though they subsequently attended their own chapels. An occasional Conformity Bill, imposing penalties on those who adopted this practice, as far exceeded the Commons (1704), but was rejected by the House of Lords, in which the Whig element predominated. The church was served in a nobler manner in 1704 by the abandonment of first-fruit and tenths by the queen for the purpose of raising the pittances of the poorer clergy (see Queen Anne's Bounty). In 1709 a piece of legislation of the highest value was carried to a successful end. The Act of Union, passed in the parliaments of England and Scotland, joined the legislatures of the two kingdoms and the nations themselves in an indissoluble bond.

The ministry in office at the time of the passing of the Act of Union had suffered important changes since the commencement of the reign. The Tories had never been as earnest in the prosecution of the war as the Whigs; and Marlborough, who cared above all things for the furtherance of the war, gradually replaced Tories by Whigs in the ministry. His intention was doubtless to conciliate both parties by admitting them both to a share of power; but the Whigs were determined to have all or none, and in 1708 a purely Whig ministry was formed to support the war as the first purely Whig ministry had supported it in the reign of William. The years of its power were the years of the victories of Oudenarde (1708) and of Malplaquet (1709), bringing with them the entire ruin of the military power of Louis XIV.

Such successes, if they were not embraced in the spirit of moderation, boded no good to the Whigs. It was known that even before the last battle Louis had been ready to abandon the cause of his grandson, and that his offers had been rejected because he would not consent to join the allies in turning him out of Spain. A belief spread in England that Marlborough wished the endless prolongation of the war for his own selfish ends. Spain was far away, and, if the Netherlands were safe, enough had been done for the interests of England. The Whigs were charged with refusing to make peace when an honourable and satisfactory peace was not beyond their reach.

As soon as the demand for a vigorous prosecution of the war relaxed, the Whigs could "but rely on their domestic policy, in which they were strongest in the eyes of posterity but weakest in the eyes of contemporaries. It was known that they looked for the principle on which the queen's throne rested to the national act of the Revolution, rather than to the birth of the succession as the daughter of James II., whilst popular feeling preferred, however inconsistently, to attach itself to some fragment of hereditary right. What was of greater consequence was, that it was known that they were the friends of the dissenters, and that their leaders, if they could have had their way, would not only have maintained the Toleration Act, but would also have repealed the Test Act. The conduct of the Whig party was denounced by Dr Sacheverell (q.v.) denounced toleration and the right of resistance in tones worthy of the first days of the Restoration. Foolish as the sermon was, it was but the reflection of folly which was widely spread amongst the rude and less-educated classes. The Whig leaders unwisely took up the challenge and impeached Sacheverell. The Lords condemned the nun, but they condemned him to an easy sentence. His trial was the signal for riots. Dissenting chapels were sacked to the tone of "Crown and Sacheverell. The queen, who had personal reasons for disliking the Whigs, dismissed them from office (1710), and a Tory House of Commons was elected amidst the excitement to support the Tory ministry of Harley and St. John.

After some hesitation the new ministry made pace with France, and the treaty of Utrecht (1713), stipulating for the permanent separation of the crowns of France and Spain, and assigning Milan, Naples, and the Spanish Netherlands to the Austrian claimant, accomplished all that could reasonably be desired, though the abandonment to the vengeance of the Spanish government of her Catalan allies, and the base desertion of her continental confederates on the very field of action, brought dishonour on the good name of England. The Commons gladly welcomed his cession of the Isle of Jersey. The approval of the Lords had been secured by the creation of twelve Tory peers. In home politics the new ministry was in danger of being carried away by its meagre violent supporters. St. John, now Viscount Bolingbroke, with unscrupulous audacity placed himself at their head. The occasional Conformity Bill was at last carried (1711). Conformity required dissenters to keep schools or engage in tuition. Bolivia, he went still further. He engaged in an intrigue for bringing over the Pretender to succeed the queen upon her death. This wild conduct alienated the moderate Tories, who, much as they wished to see the throne occupied by the heir of the ancient line, could not bring themselves to consent to its occupation by a Roman Catholic prince. Such men, therefore, when Anne died (1714) joined the Whigs in proclaiming the elector of Hanover king as George I.

X. THE HANOVERIAN KINGS (1714-1779)

The accession of George I. brought with it the predominance of the Whigs. They had on their side the royal power, the greater part of the aristocracy, the dissenters and the higher trading and commercial classes. The Tories appealed to the dislike of dissenters prevalent amongst the country gentlemen and the country clergy, and to the jealousy felt by the agricultural classes towards those who enriched themselves by trade. Such a feeling, if it was aroused by irritating legislation, might very probably turn to the advantage of the exiled house, especially as the majority of Englishmen were to be found on the Tory side. It was therefore advisable that government should content itself with as little action as possible, in order to give time for old habits to wear themselves out. The landing of the Pretender in Scotland (1715), and the defeat of a portion of his army which had advanced to Preston—a defeat which was the consequence of the apathy of his English supporters, and which was followed by the complete suppression of the rebellion—gave increased strength to the Whig government. But they were reluctant to face an immediate dissolution, and the Septennial Act was passed (1716) to extend to seven years the duration of parliaments, which had been fixed at three years by the Triennial Act of William and Mary. Under General Stanhope an effort was made to draw legislation in a more liberal direction. The Occasional Conformity Act and the Schism Act were repealed (1719); but the majorities on the side of the government were unusually small, and Stanhope, who would willingly have repealed the
Test Act so far as it related to dissenters, was compelled to abandon the project as entirely impracticable. The Pearege Bill, introduced at the same time to limit the royal power of creating peers, was happily thrown out in the Commons. It was proposed, partly from a desire to guard the Lords against such a sudden increase of their numbers as had been forced on them when the treaty of Utrecht was under discussion, and partly to secure the Whigs in office against any change in the royal family. The House adopted the plan of proceeding by bills, a device which the prelates, by men who valued the immediate victory of their principles more than they trusted to the general good sense of the nation. The Lords were at this time, as a matter of fact, not merely wealthier but wiser than the Commons; and it is no wonder that, in days when the Commons, by passing the Septennial Act, had shown their distrust of their own constituents, the peers should show, by the Pearege Bill, their distrust of that House which was elected by those constituents. Nevertheless, the remedy was worse than the disease, for it would have established a close oligarchy, bound sooner or later to come into conflict with the will of the nation, and only to be overthrown by a violent alteration of the constitution.

The excitement following on the bursting of the South Sea Bubble (q.v.), and the death or ruin of the leading ministers, brought Sir Robert Walpole to the front (1721). As a man of business when men of business were few in number, the House of Commons, he was eminently fit to manage the affairs of the country. But he owed his long continuance in office especially to his sagacity. He clearly saw, what Stanhope had failed to see, that the mass of the nation was not fitted as yet to interest itself wisely in affairs of government, and that therefore the rule must be kept in the hands of the upper classes. But he was too sensible to adopt the coarse expedient which had commended itself to Stanhope, and he preferred humouring the masses to controlling them.

The struggle of the preceding century had left its mark in every direction on the national development. Out of the reaction against Puritanism had come a widely-spread relaxation of morals, and also, as far as the educated class was concerned, an eagerness for the discussion of all social and religious problems. The fierce excitement of political life had quickened thought, and the most ancienly received doctrines were held of little worth until they were brought to the test of reason. It was at this time when the House of Commons, he was more powerful than the sword, when the secretary of state would treat with condescension a writer, and when such a pamphleteer might hope, not vain, to become a secretary of state.

It was in this world of reason and literature that the Whig of the Pearege Bill moved. Walpole perceived that there was another world which understood none of these things. He could see that a great government cannot be based on a clique, however distinguished. If the mass of the people was not conscious of political wants, it was conscious of material wants. The merchant needed protection for his trade; the voters gladly welcomed election days as bringing guineas their pockets. Members of parliament were ready to sell the votes for places, for pensions, for actual money. The system was not new, as Danby is credited with the discovery that a vote in the House of Commons might be purchased. But with Walpole it reached its height.

Such a system was possible because the House of Commons was not really accountable to its constituents. The seats of its members were not published, and still less were the speeches made known. Such a silence could only be maintained around the House when there was little interest in its proceedings. The great questions of religion and taxation which had agitated the country under the Stuarts were now fairly settled. To re-awaken those questions in any shape would be dangerous. Walpole took good care never to repeat the mistake of the Sacheverell trial. When on one occasion he was led into the proposal of an unpopular excise he at once drew back. England in his days was growing rich. Englishmen were bluff and independent, in their ways often coarse and unmanly. Their life was the life depicted on Hogarth, and to the public of fielding. All high in the political instinct was not weal, seemed laid asleep itself for better ends than dead, and it would one bill or an outcry for a popular agitation against the longer employ its powers and to war. A government house and in his own conscience, direct oppression. In the government was concerned, when every Englishman, as by and by the idea would dawn on the master of his despotic evil as tyranny, and the nation that an act was a duty to regulate or control allows that a government to be weak, and the rich to oppress the strong to oppress poor.

Walpole's admission of this feeling. When George I. was for some feeble (1727), Walpole remained in succeeded by II for the possession of that power. His relief for his country's good, together which he desired of two kings born and bred in a with the incapacity of part in English affairs, completed foreign council had been effected when William first entrusted the change jervment to a united cabinet. There was now the conduct of a prime minister in England, a person who was for the first time imposing no action on the cabinet, himself was so gradually and silently effected that it is The change in the first cabinet, two kings of the coming, was a slow, it might be a sudden, and was in fact to a great it was more active. But so far as it was extent of general tendencies, it could never be obliterated. The ministries in which Somers and Montagu on the one hand in the Jey and St John on the other had taken part, there was a minister except as far as one member whose great mass was not dominated over his colleagues by the force of character or intelligence. In the reign of George II. even North and Art was universally acknowledged by the had little claim to the independence of Pitt, the change was, in fact, one of the most The important of those which the English constitution has been altered from an hereditary monarchy with a parliamentary government with a hereditary aristocracy, a parliamentary government with an hereditary aristocracy, and a parliamentary government with an hereditary aristocracy. In Walpole's time the forms of the constitution had become, in all essential particulars, what they are now. What was wanting was a national force behind them to set them to their proper work.

The growing opposition which finally drove Walpole from power was not entirely without a nobler element than could be furnished by personal rivalry, or ignorant distrust of commercial and financial success. It was well that there were complaints that a great country ought not to be governed by patronage and bribery should be raised, although, as subsequent experience showed, the causes which rendered corruption inevitable were not to be removed by the expulsion of Walpole. In Walpole from office. But for one error, indeed, it is probable of Walpole's rule would have been still further prolonged. In 1739 a popular excitement arose for a declaration War with Spain. Walpole believed that war of war against Spain. Walpole believed that war to be certainly unjust, and likely to be disastrous. He had, however, been so accustomed to give way to popular pressure that he did not perceive the difference between a wise and timely determination to have a right action undone in the face of insuperable difficulties, and an unwise and cowardly determination to do that which he believed to be wrong and impossible. He who was often in effect the most prudent against his conscience, it is by no means unlikely that he would have been recalled to power before many years were over. As it was, the failures of the war recalled on his own head, and in 1744 his long ministry came to an end.

After a short interval a successor was found in Henry Pelham. All the ordinary arts of corruption which Walpole had practised were continued, and to them were added arts of corruption IX. 18
which Walpole had disdained. He at least under-
stood that there were certain principles in accordance with which he was to conduct public affairs, and he had driven
Ministry of Henry
Pelham.

Ministry of Newcastle.

Newcastle, had no principles of government whatever. They
offered place to every man of parliamentary skill or influence.
There was no opposition, because the ministers never attempted
to do anything which would arouse opposition, and because
they were not to do anything called by any one who had
power enough to make himself dangerous; and in 1743 they
embarked on a useless war with France. In order to please the
king, who saw in every commotion on the continent of Europe
some danger to his beloved Hanover.

At most times in the history of England such a ministry
would have been driven from office by the outcry of an offended
people. In the days of the Pelham government was
regarded as lying too far outside the all-important
private interests of the community to make it worth
while to make any effort to rescue it from the degrada-
tion into which it had fallen; yet the Pelhams had not been
in power before this serene belief that the country could
get on very well without a government in any real sense
of the word was put to the test. In 1745 Charles Edward,
the son of the Pretender, landed in Scotland. He was followed
by many of the Highland clans, always ready to draw the sword
and challenge the authorities of the Lowlands; and even
in the Lowlands, and especially in Edinburgh, he found
adherents, who still felt the sting inflicted by the suppression of
the national independence of Scotland. The British army was in as
chaotic a condition as the British government, and Charles
Edward inflicted a complete defeat on a force which met him
at Prestonpans. Before the end of the year the victor, the
head of 3,000 men, had advanced to Derby. But he found
no support in England, and the mere numbers brought against him
compelled him to retreat, to find defeat at Culloden in the
following year (1746). The war on the continent had been waged
with indifferent success. The victory of Dettingen (1743) and
the glorious defeat of Fontenoy (1745) had achieved no objects
worthy of English intervention, and the peace of Aix-la-Chapelle
put an end in 1748 to hostilities which should never have been
begun. The government pursued its inglorious career as long
as Henry Pelham lived. He had at least some share in the financial
ability of the ministry, and it was not till he died in 1754 that the
real difficulties of a system which was based on the avoidance of
difficulties had fairly to be faced.

The Seven Years' War.

Moral and religious atmosphere.

Wesley and Whitefield.

As far as government was concerned, when Henry Pelham
died (1754) the lowest depth of baseness seemed to have been
reached. The duke of Newcastle, who succeeded his
brother, looked on the work of corruption with absolute
gratification, and regarded the awkward interruption of that happy arrangement which
made men subservient to flattery and money. Whilst he was
in the very act of trying to drive from office all men who were
possessed of any sort of ideas, he was surprised by a great war.
In America, the French settlers in Canada and the English settlers
on the Atlantic coast were falling to blows for the possession of
the vast territories drained by the Ohio and its tributaries.
In Europe, Frenchmen and Englishmen had striven during the
last war for authority over the native states round Pondicherry
and Madras, and the conflict threatened to break out anew.

During the Seven Years' War, 1756-1763, the French
and Indian Wars continued, with occasional interruptions.

When war began in earnest, and the reality of danger came home to
Englishmen by the capture of Minorca (1756), there arose a
demand for a more capable government than any which New-
castle could offer. Terrified by the storm of obloquy which he
aroused, he fled from office. A government was formed, of which
the soul was William Pitt. Pitt was, in some sort, to the
political life of England what Washington was to their religious
life. He brought no new political ideas into their minds, but
he ruled them by the force of his character and the example of
his purity. His weapons were trust and confidence. He
appealed to the patriotism of his fellow-countrymen, to their
imaginative love for the national greatness, and he did not
appeal in vain. He perceived instinctively that a large number, even
of those who took greedily the bribes of Walpole and the Pelhams,
took them, not because they loved money better than their
country, but because they had no conception that their country
had any need of them at all. It was a truth, but it was not
the whole truth. The great Whig families rallied under
Newcastle and drove Pitt from office (1757). But if
Pitt could not govern without Newcastle's corruption,
neither could Newcastle govern without Pitt's energy.

At last a compromise was effected, and Newcastle undertook
the work of bribing, whilst Pitt undertook the work of governing
(see CHATHAM, WILLIAM PITT, 1ST EARL OF)

The war which had already broken out, the Seven Years' War
(1756-1763), was not confined to England alone. By the
side of the duel between France and England, a war
was going on upon the continent of Europe, in which
Austria—with its allies, France, Russia, and the
German princes—had fallen upon the near kindred
of Prussia and Austria. In 1756, France and Prussia therefore
necessarily formed an alliance. Different
as the two governments were, they were both alike in recognizing,
in part at least, the conditions of progress. Even in Pitt's
day England, however imperfectly, rested its strength on the
popular will. Even in Frederick's day Prussia was ruled by
administrators selected for their special knowledge. Neither
France nor Austria had any conception of the necessity of ful-
filling these requirements. Hence the strength of England
and of Prussia. The war seemed to be a mere struggle for terri-
ory. There was no feeling in either Pitt or Frederick, such as
there was in the men who contended half a century later against
Napoleon, that they were fighting the battles of the civilized
world. There was something repulsive as well in the enthusiastic
nationalism of Pitt as in the cynical nationalism of Frederick.
Pitt's sole object was to extirpate England to a position in which she
would fear no rival. But in so doing he exalted that which, in
spite of all that had happened, best deserved to be exalted.

The habits of individual energy fused together by the inspiration of
patriotism conquered Canada. The unintelligent over-regula-
tion of the French government could not maintain the colonies
which had been founded in happier times. In 1758 Louisburg
was taken, and the mouth of the St Lawrence guarded against
France. In 1759 Quebec fell before Wolfe, who died at the
moment of victory. At the same time the naval victories of
Lagos and Quiberon Bay established the supremacy of the
British at sea. The battle of Plassey (1757) had laid Bengal at the feet
of Clive; and Coote's victory at Wandiwash (1760) led to the final ruin of the policy of French authority in southern India. When George II. died (1760) England was the first maritime and colonial power in the world (see Seven Years' War; Canada: History; India: History).

In George III. the king once more became an important factor in English politics. From his childhood he had been trained by his mother and his instructors to regard the break- ing down of the power of the great families as the task of his life. In this he was walking in the same direction as Pitt. If the two men could have worked together, England might have been spared much trouble. But the king could not understand Pitt's higher qualities, his bold confidence in the popular feeling, and his contempt for corruption and intrigue. And yet the king's authority was indispensable to Pitt, if he was to carry on his conflict against the great families with success. When the war came to an end, as it must come to an end sooner or later, Pitt's special predominance, derived as it was from his power of breathing a martial spirit into the fleets and armies of England, would come to an end too. Only the king, with his hold upon the traditional instincts of loyalty and the force of his still unimpaired prerogative, could, in ordinary times, hold head against the wealthy and influential aristocracy. Unfortunately, George III. was not wise enough to deal with the difficulty in a high-minded fashion. With a well-intentioned but narrow mind, he had nothing in him to strike the imagination of his subjects. He met influence with influence, corruption with corruption, intrigue with intrigue. Unhappily, too, his earliest relations with Pitt involved a dispute on a point on which he was right and Pitt was wrong. In 1761 Pitt resigned office, because neither the king nor the cabinet were willing to declare war against Spain in the midst of the war with France. As the war with Spain was inevitable, and as, when it broke out in the following year (1762), it was followed by triumphs for which Pitt had prepared the way, the presence of the great war-minister appeared to be fully established. But it was his love of war, not his skill in carrying it on, which was really in question. He would be satisfied with nothing short of the absolute ruin of France. He would have given England that dangerous position of supremacy which was gained for France by Louis XIV. in the 17th century, and by Napoleon in the 19th century. He would have made his country still more haughty and arrogant than it was, till other nations rose against it, as they have three times risen against France, rather than submit to the intolerable yoke. It was a happy thing for England that his plan was not carried into effect (1762).

Even as it was, a spirit of contemptuous disregard of the rights of others had been roused, which would not be easily allayed.

The king's premature attempt to secure a prime minister of his own choosing in Lord Bute (1761) came to an end through the minister's incapacity (1763). George Grenville, who followed him, kept the king in leading strings in reliance upon his parliamentary majority. Something, no doubt, had been accomplished by the incorruptibility of Pitt. It had been spared many misfortunes. Unhappily, by actual presents in money came to an end, though the practice of bribing them by place and pension long continued. The arrogance which Pitt displayed towards foreign nations was displayed by Grenville towards classes of the population of the British dominions. It was enough for him to establish a right. He never put himself in the position of those who were to suffer by its being put in force.

The first step in Grenville's conception of his duty were the American colonies. The mercantile system, which had sprung up in Spain in the 16th century, held that colonies were to be entirely prohibited from trading, except with the mother country. Every European country had adopted this view, and the acquisition of fresh colonial dominions by England, at the peace of 1763, had been made not so much through lust of empire as through love of trade. Of all English colonies, the American were the most populous and important. Their proximity to the Spanish colonies in the West Indies had naturally led to a contraband trade. To this trade Grenville put a stop, as far as lay in his power. Obnoxious as this measure was in America, the colonists acknowledged the principle on which it was founded too long to make it easy to resist it. Another step of Grenville's met with more open opposition. Even with all the experience of the century which followed, the relations between a mother country and her colonies are not easy to arrange. If the burthen of defence is to be borne in common, it can hardly be left to the mother country to declare war, and to exact the necessary taxation, without the consent of the colonies. If, on the other hand, it is to be borne by the mother country alone, she may well complain that she is left to bear more than her due share of the weight. The latter alternative forced itself upon the attention of Grenville. The British parliament, he held, was the supreme legislature, and, as such, was entitled to raise taxes in America to support the military forces needed for the defence of America. The act (1765) imposing a stamp tax on the American colonies was the result.

As might have been expected, the Americans resisted. For them, the question was precisely that which Hampden had fought out in the case of ship-money. As far as they were concerned, the British parliament had stepped into the position of Charles I. If Grenville had remained in office he would probably have persisted in his resolution. He was driven from his post by the king's resolve no longer to submit to his insolence, and a new ministry was formed under the marquess of Rockingham, composed of some of those leaders of the Whig aristocracy who had not followed the Grenville ministry. They were well-intentioned, but weak, and without political ability; and the king regarded them with distrust, only qualified by his abhorrence of the ministry which they superseded.

As soon as the bad news came from America, the ministry was placed between two recommendations. Grenville, on the one hand, advised that the tax should be enforced. Pitt, on the other, declared that the British parliament had absolutely no right to tax America, though he held that it had the right to regulate, or in other words to tax, the commerce of America for the benefit of the British merchant and manufacturer. Between the two the government took a middle course. It obtained from parliament a total repeal of the Stamp Act, but it also passed a Declaratory Act, claiming for the British parliament the supreme power over the colonies in matters of taxation, as well as in matters of legislation.

It is possible that the course thus adopted was chosen simply because it was a middle course. But it was probably suggested by Edmund Burke, who was then Lord Rockingham's private secretary, but who for some time to come was to furnish thought to the party to which he attached himself. Burke carried into the world of theory those politics of expediency of which Walpole had been the practical originator. He held that questions of abstract right had no place in politics. It was therefore as absurd to argue with Pitt that England had a right to regulate commerce, as it was to argue with Grenville that England had a right to levy taxes. All that could be said was, that it was expedient in a widespread empire that the power of final decision should be lodged somewhere, and that it was also expedient not to use that power in such a way as to irritate those whom it was the truest wisdom to conciliate.

Burke's political theory.

The other side of this view was the weak side of all Burke's political philosophy. Like all great innovators, he was intensely conservative where he was not an advocate of change. With new views on every subject relating to the exercise of power, he shrank even from entertaining the slightest question relating to the distribution of power. He recommended to the British parliament the most self-denying wisdom, but he could not see that in its relation to the colonies the British parliament was so constituted as to make it entirely unprepared to be either wise or self-denying. It is true that if
he had thought out the matter in this direction, he would have been led further than he or any other man in England or America was at that time prepared to go. If the British parliament was unfit to legislate for America, and if, as was undoubtedly the case, it was impossible to create a representative body which was fit to legislate, it would follow that the American colonies could only be fairly governed as practically independent states, though they might possibly remain, like the great colonies of our own day, in a position of alliance rather than of dependence. It was because the issues opposed to changes so far greater than the wisest statesman ever thought of, persevered, that Pitt's solution, logically untenable as it was, was preferable to Burke's. Pitt would have given bad reasons for going a step in the right direction. Burke gave excellent reasons why those who were certain to go wrong should have the power to go right.

Ministry of Lord Chatham.

SCARCELY were the measures relating to America passed when the king turned out the ministry. The new ministry was formed by Pitt, who was created Earl of Chatham (1766), on the principle of bringing together men who had shaken themselves loose from any of the different Whig cliques. Whatever chance the plan had of succeeding was at an end when Chatham's mind temporarily gave way under stress of disease (1767). Charles Townshend, a brilliant, headstrong man, led parliament in the way which had been prepared by the Declaratory Act, and laid duties on tea and other articles of commerce entering the ports of America.

It was impossible that the position thus claimed by the British ministry could be more insight into the 13 colonies should be left America alone. The habit of obtaining money otherwise than by the consent of those who are required to pay it would be certain to make parliament careless of the feelings and interests of that great majority of the population at home, which was unrepresented in parliament. The resistance of America to the taxation imposed was therefore not without benefit to the people of the mother country. Already there were signs of a readiness in parliament to treat even the constituencies with contempt. In 1763, in the days of the Grenville ministry, John Wilkes, a prodigal and scurrilous writer, had been arrested on a general warrant—that is to say, a warrant in which the name of no individual was mentioned—

as the author of an alleged libel on the king, contained in No. 45 of The North Briton. He was a member of parliament, and as such was declared by Chief Justice Pratt to be privileged against arrest. In 1768 he was elected member for Middlesex. The House of Commons expelled him. He was again elected and again expelled. The third time, the Commons gave the seat to which Wilkes was a third time chosen to Colonel Luttrell, who was far down in the poll. Wilkes became the representative of a great constitutional principle, the principle that the electors have a right to choose their representatives without restriction, save by the regulations of the law.

For the present the contention of the American colonists and of the defenders of Wilkes at home was confined within the compass of the law. Yet in both cases it might easily pass beyond that compass, and might rest itself upon an appeal to the duty of governments to modify the law, and to enlarge the basis of their authority, when law and authority have become too narrow.

As regards America, though Townshend died, the government persisted in his policy. As resistance grew stronger in America, the king urged the use of compulsion. If he had not the wisdom of the country on his side, he had its prejudices. The king's conduct was in fact the turning point of English feeling. Europe was divided as never before. France and Spain were on the side of the Americans, and all the patronage of the government in his hands, and beyond the circle which was influenced by gifts of patronage, he could appeal to the ignorance and self-seeking of the nation, with which, though he knew it not, he was himself in the closest sympathy.

No wonder resistance grew more vigorous in America. In 1773 the inhabitants of Boston threw ship-loads of tea into the harbour rather than pay the obnoxious duty. In 1774 the Boston Port Bill deprived Boston of its commercial rights, whilst the Massachusetts Government Bill took away from that colony the ordinary political liberties of Englishmen. The first skirmish of the inevitable war was fought at Lexington in 1775. In 1776 the thirteen colonies united in the continental congress issued their Declaration of Independence. England put forth all its strength to beat down resistance; but the task, which seemed easy at a distance, proved impossible. It might have been so even had the war been conducted on the British side with greater military skill than it was, but it was conducted by a ministry which was essentially a civil contest between men of the same race. But the initial difficulties of the vast field of operations were greatly increased by the want of skill of the British leaders in adapting themselves to new conditions, while even loyal sentiment was shocked by the employment of German mercenaries and Red Indian savages against men of English blood. Even so, the issue of the struggle was far from doubtful, and there were moments when it might have ended by a policy of wise concession; but the Americans, though reduced at times to desperate straits, had the advantage of fighting in their own country, and above all they found in George Washington a leader after the model of the English country gentleman who had upheld the standard of liberty against the Stuarts, and worthy of the great cause for which they fought. In 1777 a British army under Burgoyne capitulated at Saratoga; and early in 1778 France, eager to revenge the disasters of the Seven Years' War, revolted all the colonies as free and independent states, and was soon joined by Spain.

Chatham, who was ready to make any concession to America short of independence, and especially of independence at the dictate of France, died in 1778. The war was continued for some years with varying results; but in 1781 the capitulation of a second British army under Cornwallis at Yorktown was a decisive blow, which brought home to the minds of the dullest the assurance that the conquest of America was an impossibility. But even this event happened there had been a great change in public feeling in England. The increasing weight of taxation gave rise in 1780 to a great meeting of the freemen of Yorkshire, which in turn gave the signal for a general agitation for the reduction of unnecessary expense in the government. To this desire Burke gave expression in his bill for economical reform, though he was unable to carry it in the teeth of interested opposition. The movement in favour of economy was necessarily checked; but in a few months the Hanoverian ministry of Yorktown was known (1782), Lord North at once resigned office.

The new ministry formed under Lord Rockingham comprised not only his own immediate followers, of whom the most prominent was Charles Fox, but the followers of Chatham, of whom Lord Shelburne was the acknowledged leader. A treaty of peace acknowledging the independence of the United States of America was at once set on foot; and the negotiation with France was rendered easy by the defeat of a French fleet by Rodney, and by the failure of the combined forces of France and Spain to take Gibraltar.
Already the ministry on which such great hopes had been placed had broken up. Rockingham died in July 1782. The two sections of which the government was composed had different aims. The Rockingham section, which now looked up to Fox, rested on aristocratic connexion and influence; the Shelburne section was anxious to gain popular support by active reforms, and to gain over the king to their side. Judging by past experience, the combination might well seem hopeless, and honourable men like Fox might easily regard it with suspicion. But Fox's allies took good care that their name should not be associated with the idea of improvement. They pruned Burke's Economical Reform Bill till it left as many abuses as it suppressed; and when they had put the grant over the £3,000 limit, above £4,000, they hastily gave away pensions of much larger value to their own friends before the bill had received the royal assent. They also opposed a bill for parliamentary reform brought in by young William Pitt. When the king chose Shelburne as prime minister, they refused to follow him, and put forward the incompetent duke of Portland as their candidate for the office. The struggle was thus renewed on the old ground of the king's right to select his ministers. But while the king now put forward a minister notoriously able and competent to the task, his opponents put forward a man whose only claim to office was the possession of large estates. They forced their way back to power by means as unscrupulous as their claim to it was unjustifiable. They formed a coalition with Lord North, whose politics and character they had denounced for years. The coalition, as soon as the peace with America and the French war had been signed (1783), drove Shelburne from office. The duke of Portland became the nominal head of the government, Fox and North its real leaders.

Such a ministry could not afford to make a single blunder. The king detested it, and the assumption by the Whig houses of a right to nominate the head of the government without reference to the national interests, could never be popular. The blunder was soon committed. Burke, having wrong and judicially with a bitter hatred, had described in the government of British India by the East India Company a disgrace to the English name. For many of the actions of that government no honourable man can think of uttering a word of defence. The helpless natives were oppressed and robbed by the company and its servants in every possible way. Burke drew up a bill, which was adopted by the coalition government, for taking all authority in India out of the hands of the company, and even placing the company's management of its own internal affairs under the control of a new and controlling body, which was naturally to be a council appointed at home. The question of the nomination of this council at once drew the whole question within the domain of party politics. The whole patronage of India would be in its hands, and, as parliament was then constituted, the balance of parties might be more seriously affected by the distribution of that patronage than it would be now. When, therefore, it was understood that the government bill meant the council to be named in the bill for four years, or, in other words, to be named by the coalition ministry, it was generally regarded as an unblushing attempt to turn a measure for the good government of India into a measure for securing the ministry in office. The bill of course passed the Commons. When it came before the Lords, it was thrown out in consequence of a message from the king, that he would regard any one who voted for it as his enemy. The contest had thus become one between the influence of the crown and the influence of the great houses. Constituted historians, who treat the question as one of merely theoretical politics, leave out of consideration this essential element of the situation, and forget that, if it was wrong for the king to influence the Lords by his message, it was equally wrong for the ministry to acquire for themselves fresh patronage with which to influence the Commons. But there was now, what there had not been in the time of Walpole and the Pelhams, a public opinion ready to throw its weight on one side or the other. The county members still formed the most independent portion of the representation, and there were many possessors of rotten boroughs, who were ready to agree with the county members rather than with the great landowners. In choosing Pitt, the young son of Chatham, for his prime minister, as soon as he had dismissed the coalition, George III gave assurance that he wished his counsels to be directed by integrity and ability. After a struggle of many weeks, parliament was dissolved (1784), and the new House of Commons was prepared to support the king's minister by a large majority.

As far as names go, the change effected placed the new Tory party in office for an almost uninterrupted period of forty-six years. It so happened, however, that after the first eight years of that period had passed by, circumstances occurred which effected so great a change in the composition and character of that party as to render any statement to this effect entirely illusive. During eight years, however, Pitt's ministry was not merely a Tory ministry resting on the choice of the king, but a Liberal ministry resting on national support and upon advanced political knowledge.

The nation which Pitt had behind him was very different from the populace which had assailed Walpole's Excise Bill, or had shouted for Wilkes and liberty. At the beginning of the century the intellect of thoughtful Englishmen had applied itself to speculative problems of religion and philosophy. In the middle of the century it applied itself to practical problems affecting the employment of industry. In 1775 Adam Smith published "Wealth of Nations." Already in 1762 the work of Brindley, the Bridgewater canal, the first joint of a network of inland water communication, was opened. In 1767 Hargreaves produced the spinning-jenny; Arkwright's spinning machine was exhibited in 1768; Crompton's mule was finished in 1779; Cartwright hit upon the idea of the power-loom in 1784, though it was not brought into profitable use till 1801. The Staffordshire potteries had been flourishing under Wedgwood since 1763, and the improved steam-engine was brought into shape by Watt in 1768. During these years the duke of Bedford, Coke of Norfolk, and Robert Bakewell were busy in the improvement of stock and agriculture. The increase of wealth and prosperity caused by these changes went far to produce a large class of the population entirely outside the associations of the landowning class, but with sufficient intelligence to appreciate the advantages of a government carried on without regard to the personal interests and rivalries of the aristocracy. The mode in which that increase of wealth was effected was on the whole beneficial to the state. The substitution of the organisation of hereditary monarchy for the organization of wealth and station would ultimately have led to evils as great as those which it superseded. It was only tolerable as a stepping-stone to the organization of intelligence. The larger the numbers admitted to influence the affairs of state, the more necessary is it that they respect the powers of intellect. It would be foolish to institute a comparison between an Arkwright or a Crompton and a Locke or a Newton. But it is certain that for one man who could appreciate the importance of the treatise 'On the Human Understanding or the Theory of Gravitation, there were thousands who could understand the value of the water-frame, or the power-loom. The habit of looking with reverence upon mental power was fostered in no slight measure by the industrial development of the second half of the 18th century.

The supremacy of intelligence in the political world was, for the time, represented in Pitt. In 1784, he passed an India Bill which left the commerce and all except the highest patronage of India in the hands of the East India Company, but which erected a department of the home government, named the board of control, to compel the company to carry out such political measures as the government saw fit. A bill for parliamentary reform was, however, thrown out by the opposition of his own supporters in parliament, whilst outside parliament there was no general desire for a change in a system which for the present produced such excellent fruits.
Still more excellent was his plan of legislation for Ireland. Irishmen had taken advantage of the weakness of England during the American War to enforce upon the ministry of the day, in 1780 and 1781, an abandonment of all claim on the part of the English government and the English judges to interfere in any way with Irish affairs. From 1782, therefore, there were two independent legislatures within the British Isles—the one sitting at Westminster and the other sitting in Dublin. With these political changes Fox professed himself to be content. Pitt, whose mind was open to wider considerations, proposed to throw open commerce to both nations by removing all the restrictions placed on the trade of Ireland with England and with the rest of the world. The rejection of the British parliament and its removal by concessions continuing some important restrictions upon Irish exports, and by giving the English parliament the right of initiation in all measures relating to the regulation of the trade which was to be common to both nations. The Irish parliament took umbrage at the superiority claimed by England, and threw out the measure as an insult, though, even as it stood, it was undeniably in favour of Ireland. The lesson of the incompatibility of two coordinate legislatures was not thrown away upon Ireland.

In 1786 the commercial treaty with France opened that country to English trade, and was the first result of the theories laid down by Adam Smith ten years previously. The first attack upon the horrors of the slave-trade was made in 1788; and in the same year, in the debates on the Regency Bill caused by the king's insanity, Pitt defended against Fox the right of parliament to make provision for the exercise of the powers of the crown when the wearer was permanently or temporarily disabled from exercising his authority.

When the king recovered, he went to St Paul's to return thanks on the 23rd of April 1789. The enthusiasm with which he was greeted showed how completely he had the nation on his side. All the hopes of liberal reformers were now with him. All the hopes of moral and religious men were on his side as well. The seed sown by Wesley had grown to be a great tree. A spirit of truthfulness in religious matters and of moral energy was growing in the nation, and the king was endeared to his subjects, as much by his domestic virtues as by his support of the great minister who acted in his name. The happy prospect was soon to be overclouded. On the 4th of May, eleven days after the appearance of George III. at St Paul's, the French states-general met at Versailles.

By the great mass of intelligent Englishmen the change was greeted with enthusiasm. It is seldom that one nation under- stands the tendencies of another so well. The mere fact that power was being transferred from an absolute monarch to a representative assembly led superficial observers to imagine that they were witnessing a mere repetition of the victory of the English parliament over the Stuart kings. In fact, that which was passing in France was of a totally different nature from the English struggle of the 17th century. In England, the conflict had been carried on for the purpose of limiting the power of the king. In France, it was begun in order to sweep away an aristocracy in church and state which had become barbarously oppressive. The French Revolution was not, therefore, a conflict for the reform of the political organization of the state, but one for the reorganisation of the whole structure of society; and in proportion as it turned away from the path which English ignorance had marked out for it, Englishmen turned away from it in disgust. As they did not understand the aims of the French Revolutionists, they were unable to make that use for even so much of their conduct as admits of excuse. Three men, Fox, Burke and Pitt, however, represented three varieties of opinion into which the nation was very unequally divided.

Fox, generous and trustful towards the movements of large masses of men, had very little intellectual grasp of the questions at issue in France. He treated the struggle as one simply for the establishment of free institutions; and when at last the crimes of the leaders became patent to the world, he contented himself with lamenting the unfortunate fact, and fell back on the argument that though England could not sympathize with the French tyrants, there was no reason why she should go to war with them.

On the other hand, while he failed to understand the full tendency of the Revolution for good as well as for evil, understood it far better than any Englishman of that day understood it. He saw that its main aim was equality, not liberty, and that not only would the French nation be ready, in pursuit of equality, to welcome any tyranny which would serve its purpose, but would be the more prone to acts of tyranny over individuals. This would arise from the remodelling of institutions, the object of giving command to the will of the masses, which was especially liable to be counteracted by designing and unscrupulous agitators. There is no doubt that in all this Burke was in the right, as he was in his denunciation of the mischief certain to follow when a nation tries to start afresh, and to blot out all past progress in the light of simple reason, which is often most fallible when it believes itself to be most infallible. Where he went wrong was in his ignorance of the special circumstances of the French nation, and his consequent blindness to the fact that the historical method of gradual progress was impossible where institutions had become so utterly bad as they were in France, and that consequently the system of starting afresh, to which he reasonably objected, was to the French a matter not of choice but of necessity. Nor did he see that the passion for equality, like every great passion, justified itself, and that the problem was, not how to obtain liberty in defiance of it, but how so to guide it as to obtain liberty by it and through it.

Burke did not content himself with pointing out speculatively the evils which he foreboded for the French. He perceived clearly that the effect of the new French principles could no more be confined to French territory than the principles of Protestantism in the 16th century could be confined to Saxony. He knew well that the appeal to abstract reason and the hatred of aristocracy would spread over Europe like a flood, and, as he was in the habit of considering whatever was most opposed to the object of his dislike to be wholly excellent, he called for a crusade of all established governments against the anarchical principles of dissolution which had broken loose in France.

Pitt occupied ground apart from either Fox or Burke. He had neither Fox's sympathy for popular movements, nor Burke's intellectual appreciation of the immediate tendencies of the Revolution. Hence, whilst he pronounced against any active interference with France, he was an advocate of peace, not because he was more statesmanlike than Fox or Burke, but because he saw less. He fancied that France would be so totally occupied with its own troubles that it would cease for a long time to be dangerous to other nations.

This view was soon to be stultified by the effect of the coalition against France in 1792 of Prussia and Austria. The proclamation of the allies calling on the French to restore the royal authority was answered by a passionate outburst of defiance. The king himself was suspected of complicity with the invaders of his country, and the rising of the 10th of August was followed by the proclamation of the republic and by the awful "September massacres" of helpless prisoners, guilty of no crime but noble birth, and therefore presumably of attachment to the old régime, and treason towards the new. This passionate attachment to the Revolution, which in France displayed itself in a carnival of insane suspicion and cruelty, inspired on the frontiers an astonishing patriotic resistance. Before the end of the year the Austrian, the German, and the ragged armies of the Revolution had overrun Savoy and the Austrian Netherlands, and were threatening the aristocratic Dutch republic.

Very few governments in Europe were so rooted in the affections of their people as to be able to look without terror on the challenge thus thrown out to them. The English government was one of those very few. No mere despotism was here exercised by the king. No broad impassable line here divided
the aristocracy from the people. The work of former generations of Englishmen had been too well done to call for that breach of historical continuity which was a dire necessity in France. There was much need of reform. The spirit of revolution which Pitt's Whig ministry had excited in the upper and middle classes, with few exceptions, clung together in a fierce spirit of resistance; and the mass of the lower classes, especially in the country, were too well off to wish for change. The spirit of resistance to revolution quickly developed into a spirit of resistance to reform, and those who continued to advocate changes, more or less after the French model, were treated as the enemies of mankind. A fierce hatred of France and of all that attached itself to France became the predominating spirit of the nation.

Such a change in the national mind could not but affect the constitution of the Whig party. The reasoning of Burke would, in itself, have done little to effect its disruption. But the great landowners, who contributed so strong an element in it, composed the very class which had most to fear from the principles of the Revolution. The old questions which had divided them from the king and Pitt in 1783 had dwindled into nothing before the appalling question of the immediate present. They made themselves the leaders of the war party, and they knew that that party comprised almost the whole of the parliamentary classes.

What could Pitt do but surrender? The whole of the intellectual basis of his foreign policy was swept away when it became evident that the continental war would bring with it an accession of French territory. He did not abandon his opinions. His完整opinions rather abandoned him. A wider intelligence might have held that, let France gain what territorial aggrandizement it might upon the continent of Europe, it was impossible to resist such changes until the opponents of France had so purified themselves as to obtain a hold upon the moral feelings of mankind. Pitt could not take this view; perhaps no man in his day could be fairly expected to take it. He did not indeed declare war against France; but he sought to set a limit to her conquests in the winter, though he had not sought to set a limit to the conquests of the allied sovereigns in the preceding summer. He treated with supercilious contempt the National Convention, which had dethroned the king and proclaimed a republic. Above all, he took up a declaration by the Convention, that they would give help to all peoples struggling for liberty against their respective governments, as a challenge to England. The horror caused in England by the trial and execution of Louis XVI. completed the estrangement between the two countries, and though the declaration of war came from France (1793), it had been in great part brought about by the bearing of England and its government.

(S. R. G.)

XI. THE REVOLUTIONARY EPOCH, THE REACTION, AND THE TRIUMPH OF REFORM (1793-1837)

In appearance the great Whig landowners gave their support to Pitt, and in 1794 some of their leaders, the duke of Portland, Lord Fitzwilliam, and Windham, entered the cabinet to serve under him. In reality it was Pitt who had surrendered. The ministry and the party by which it was supported might call themselves Tory still; but the great reforming policy of 1784 was at an end, and the government, unconscious of its own strength, conceived its main function to be at all costs to preserve the constitution, which it believed to be in danger of being overwhelmed by the rising tide of revolutionary feeling. That this belief was idle it is easy enough to see; at the time this was not so obvious. Thomas Paine's *Rights of Man*, published in 1791, a brilliant and bitter attack on the British constitution from the Jacobin point of view, sold by tens of thousands. Revolutionary societies with high-sounding names were established, of which the most conspicuous were the Revolution Society, the Society for Constitutional Information, the London Corresponding Society, and the Friends of the People. Of these, indeed, only the two last were directly due to the example of France. The Revolution Society, founded to commemorate the revolution of 1788, had long carried on a respectable existence under the patronage of cabinet ministers; the Society for Constitutional Information, of which Pitt himself had been a member, was founded in 1780 to advocate parliamentary reform; both had, however, developed under the influence of the events in France in a revolutionary direction. The London Corresponding Society, composed mainly of working-men, was the direct outcome of the excitement caused by the developments of the French Revolution. Its leaders were obscure and usually illiterate men, who delighted to propound their theories for the universal reformation of society and the state in rhetoric of which the characteristic phrases were borrowed from the tribune of the Jacobin Club. Later generations have learned by repeated experience that the eloquence of Hyde Park orators is not the voice of England; there were some even then—among those not immediately responsible for keeping order—who urged the government "to trust the people"; but with the object-lesson of France before them it is not altogether surprising that ministers refused to believe in the harmlessness of societies, which not only kept up a fraternal correspondence with the National Convention and the Jacobin Club, but, by attempting to establish throughout the country a network of affiliated clubs, were apparently aiming at setting up in Great Britain the Jacobin idea of popular control.

The danger, of course, was absurdly exaggerated; as indeed was proved by the very popularity of the repressive measures to which the government thought it necessary to resort, and which gave to the vapourings of a few knots of agitators the dignity of a widespread conspiracy for the overthrow of the constitution. On the 1st of December 1792 a proclamation was issued calling out the militia on the ground that a dangerous spirit of tumult and disorder had been excited by evil-disposed persons, acting in concert with persons in foreign parts, and this statement was repeated in the king's speech at the opening of parliament on the 15th. In spite of the protests of Sheridan and other members of the opposition, a campaign of press and other prosecutions now began which threatened to extinguish the most cherished right of Englishmen—liberty of speech. The country was flooded with government spies and informers, whose efforts were seconded by such voluntary societies as the Association for preserving Liberty and Property against Republicans and Levellers, founded by John Reeves, the historian of English law. No one was safe from these zealous and too often credulous defenders of the established order; and a few indiscreet words spoken in a coffee house were enough to bring imprisonment and ruin, as in the case of John Frost, a respectable attorney, condemned for sedition in March 1793. In Scotland the panic, and the consequent cruelty, were worse than in England. The meeting at Edinburgh of a "convention of delegates of the associated friends of the people," at which some foolish and exaggerated language was used, was followed by the trial of Thomas Muir, a talented young advocate whose brilliant defence did not save him from a sentence of fourteen years' transportation (August 30, 1793), while seven years' transportation was the punishment of the Rev. T. Fysh Palmer for circulating an address from "a society of the friends of liberty to their fellow-citizens" in favour of a reform of the House of Commons. These sentences and the proceedings which led up to them, though attacked with bitter eloquence by Sheridan and Fox, were confirmed by a large majority in parliament.

It was not, however, till late in the session of 1794 that ministers laid before parliament any evidence of seditious practices. In May certain leaders of democratic societies were arrested and their papers seized, and on the 13th a king's message directed the books of certain corresponding societies to be laid before both Houses. The committee of the House of Commons at once reported that there was evidence of a conspiracy.

1 The position of the Corresponding Society was greatly strengthened by the establishment of the Friends of the People by Erskine and Grey.
to supersede the House of Commons by a national convention, and Pitt proposed and carried a bill suspending the Habeas Corpus Act. This was followed by further reports of the committees of both Houses, presenting evidence of the secret manufacture of arms and of other proceedings calculated to endanger the public peace. A series of state prosecutions followed. The trials of Robert Watt and David Downie for high treason (August and September 1794) actually revealed a treasonable plot on the part of a few obscure individuals at Edinburgh, who were found in the possession of no less than fifty-seven pikes of home manufacture, wherewith to overthrow the British government. The execution of Watt gave to this trend of proceedings a very new and considerable shock. Members of the Corresponding Society, accused of conspiring to murder the king by means of a poisoned arrow shot from an air-gun. The ridicule that greeted the revelation of the "Pop-gun Plot" marked the beginning of a reaction that found a more serious expression in the trials of Thomas Hardy, John Horne Tooke and John Thelwall (October and November 1794). The prisoners were accused of high treason, their chief offence consisting in their attempt to assemble a general convention of the people, ostensibly for the purpose of effecting a constitutional reform, but really—as the prosecution urged—for subverting the constitution. This latter charge, though proved to the satisfaction of the committees of both Houses of Parliament, broke down under the cross-examination of the government witnesses by the counsel for the defence, and could indeed only have been substantiated by a dangerous stretching of the doctrine of constructive treason. Happily the jury refused to convict, and its verdict saved the nation from the disgrace of meting out the extreme penalty of high treason to an attempt to hold a public meeting for the redress of grievances.

The common sense of a British jury had preserved, in spite of parliament and ministry, that free right of meeting which was to be one of the strongest instruments of future reform. The government, however, saw little reason in the events of the following months for reversing their coercive policy. The year 1795 was one of great suffering and great popular unrest; for the effect of the war upon industry was now beginning to be felt, and the distress had been aggravated by two bad harvests. The sudden determination of those in power, who had hitherto advocated reform, to stereotype the existing system, closed the avenues of hope to those who had expected an improvement of their lot from constitutional changes, and the disaffected temper of the populace that resulted was taken advantage of by the London Corresponding Society, embodied by its triumph in the case already to organize open and really dangerous demonstrations, such as the vast mass meeting at Copenhagen House on the 26th of October. On the 29th of October the king, on his way to open parliament, was attacked by an angry mob shouting, "Give us bread," "No Pitt," "No war," "No famine;" and the glass panels of his state coach were smashed to pieces.

The result of these demonstrations was the introduction in the House of Lords, on the 4th of November, of the Treasonable Practices Bill, the main principle of which was that it modified the law of treason by dispensing with the necessity for the proof of an overt act in order to secure conviction; and in the House of Commons, on the 10th, of the Seditionary Meetings Bill, which seriously limited the right of public meeting, making all meetings of over fifty persons, as well as all political debates and lectures, subject to the previous consent and active supervision of the magistrates. In spite of the strenuous resistance of the opposition, led by Fox, and of numerous meetings of protest held outside the walls of parliament, both bills passed into law by enormous majorities. The inevitable result followed. The London Corresponding Society and other political clubs, deprived of the right of public meeting, became secret societies pledged to the overthrow of the existing system by any means. United Englishmen and United Scotsmen plotted with United Irishmen for a French invasion, and sedition was fomented in the army and the navy. Their baneful activities were exposed in the inquiries that followed the Irish rebellion of 1798, and the result was the Corresponding Societies Bill, introduced by Pitt on the 19th of April 1799, which completed the series of repressive measures and practically suspended the popular constitution of England. The right of public meeting, of free speech, of the free press and of all other proceedings calculated to endanger the public peace was at an end.

The justification of the government in all this was the life and death struggle in which Great Britain was engaged with the power of republican France in Europe. Yet Pitt's conduct of the war, so far as the continent was concerned, had hitherto led to nothing but failure after failure. In 1794, in spite of the presence of an English army under the duke of York, the Austrian Netherlands had capitulated to the French, and a republic which was founded by virtue of French arms in 1795 the Dutch republic was affiliated to that of France, and the peace of Basel between Prussia and the French republic left Austria to continue the war alone with the aid of British subsidies. On the sea Great Britain had been more successful. Howe's victory of the 1st of June 1794 being the first of the long series of defeats inflicted on the French navy, while in 1795 a beginning was made of the vast expansion of the British Empire by the capture of Ceylon and the Cape of Good Hope from the Dutch (see FRENCH REVOLUTIONARY WAR). The war, however, had become so expensive, and its results were evidently so small, that there was a growing feeling in England in favour of peace, especially as the Reign of Terror had come to an end in 1794, and a regular government, the Directory, had been appointed in 1795. At last Pitt was forced to yield to the popular clamour, and in 1796 Lord Malmesbury was sent to France to treat for peace. The negotiation, however, was at once broken off by his demand that France should abandon the Netherlands.

The French government, assured now of the assistance of Spain and Holland, and freed of the danger from La Vendée, now determined to attempt the invasion of Ireland. On the 16th of December a fleet of 17 battle-ships, 13 frigates and 15 smaller vessels set sail from Brest, carrying an expeditionary force of some 13,000 men under General Hoche. The British fleet, under Lord Bridport, was wintering at Spithead; and before it could put to sea the French had slipped past. Before it reached the coast of Ireland, however, the French fleet had already suffered serious losses, owing partly to the attacks of British frigate detachments, partly to the bad seamanship of the French crews and the rottenness of the ships. Only a part of the fleet succeeded in reaching Bantry Bay on the 20th of December, and of these a large number were scattered by a storm on the 23rd. Hoche himself, with the French admiral, had been driven far to the westward in an effort to avoid capture; the admiral himself, in his absence, to land a force was defeated by the weather, and by the end of the month the whole expedition was in full retreat for Brest. A French division on the coast of Pembroke was even less successful; a force of 1200 men, under Colonel Tate, an American adventurer, landed in Cardigan Bay on the 22nd of February 1797, but was at once surrounded by the local militia and surrendered without a blow.

A more serious attempt was now made to renew the enterprise by means of a junction of the French, Spanish and Dutch fleets. The victory of Jervis over the Spanish fleet at St Vincent on the 14th of February postponed the imminence of the danger; but this again became acute owing to the general disaffection in the fleet, which in April and May found vent in the serious mutinies at Spithead and the Nore. The mutiny at Spithead, which was due solely to intolerable conditions under which the seamen served at the time, was ended on the 17th of May by concessions: an increase of pay, the removal of officers who had abused their power of discipline, and the promise of a general free pardon. More serious was the outbreak at the Nore. The disaffection had spread practically to the whole of Admiral Duncan's fleet, and by the beginning of June the mutineers were blockading the Thames with no less than 26 vessels. The demands of the seamen were more extensive than at Spithead; their resistance was better organized; and they were suspected, though without
reason, of harbouring revolutionary designs. The return of the Channel fleet to its duty emboldened the admiralty to refuse any concessions, and the vigorous measures of repression taken proved effective. One by one the mutinous crews surrendered; and the arrest of the ringleader, Richard Parker, on board the "Sandwich," on the 14th of June, brought the affair to an end.\footnote{A vivid account of the mutiny and its causes is given in Captain Marryat's "King's Own."}

The seamen regained their reputation, and those who had been imprisoned their liberty, by Duncan's victory over the Dutch fleet at Camperdown (October 11), by which the immediate danger was averted. Though the French attempt at a concerted invasion had failed, however, the Directory did not abandon the enterprise, and commissioned Bonaparte to draw up fresh plans.

At the close of the year 1797 the position of Great Britain was indeed sufficiently alarming. On the 18th of April, during the very crisis of the mutiny at Spithead, Austria had signed with Bonaparte the humiliating terms of the preliminary peace of Leoben, which six months later were embodied in the treaty of Campo Formio (October 17). On the 10th of August Portugal had concluded a treaty with the French Republic; and Great Britain was left without an ally in Europe. The mutiny at the Nore, the threat of rebellion in Ireland, the alarming fall in consols, argued strongly against continuing the war single-handed, and in July Lord Malmesbury had been sent to Lille to open fresh negotiations with the plenipotentiaries of France. The锗ologists broke down the refusal of England to recognize the Cape of Good Hope to the Dutch. But though forced, in spite of misgivings, to continue the struggle, the British government in one very important respect was now in a far better position to do so. For though Great Britain was now isolated and her policy in Europe advertised as a failure, the temper of the British people was less inclined to peace in 1798 than it had been three years before. The early enthusiasm of the disfranchised classes for French principles had cooled with the later developments of the Revolution; the attempted invasions had roused the national spirit; and in the public imagination the sinister figure of Bonaparte, the rapacious conqueror, was beginning to loom large to the exclusion of lesser issues. Henceforth, in spite of press prosecutions and trials for political libel, the government was supported by public opinion in its vigorous prosecution of the war.

If the danger of French invasion was a reality, it was so mainly owing to the deplorable condition of Ireland, where the natural disaffection of the Roman Catholic majority of the population—deprived of political and many social rights, and exposed to the insults and oppression of a Protestant minority corrupted by centuries of ascendency—invited the intervention of a foreign enemy. The full measure of the intolerable conditions prevailing in the country was revealed by the horrors of the rebellion of 1798, and after this had been suppressed Pitt decided that the only way to deal with the situation was to establish a union between Great Britain and Ireland, similar to that which had proved so successful in the case of England and Scotland. He saw that to establish peace in Ireland the Roman Catholics would have to be enfranchised; he realized that to enfranchise them in a separated Ireland would be to subject the proud Protestant minority to an impossible domination, and to establish not peace but war. The Union, then, was in his view the necessary preliminary to Catholic emancipation, which was at the same time the reward held out to the majority of the Irish people for the surrender of their national quasi-independence. It was a bribe little likely to appeal to the Protestant minority which constituted the Irish parliament, and to them other inducements had to be offered if the scheme was to be carried through. These inducements were not all corrupt. Those members who stood out were, indeed, bought by a lavish distribution of money and coronets; but the advantages to Ireland which might reasonably be expected from the Union were many and obvious; and if all the promises held out by the promoters of the measure have even now not been realized, the fault is not theirs. The Act of Union was placed on the statute-book in 1800; Catholic emancipation was to have been accomplished in the following session, the first of the united parliament. But Pitt's policy broke on the stubborn obstinacy of George III., who believed himself bound by his coronation oath to resist any concession to the enemies of the Established Church. The disadvantage of the possession of too strait a conscience in politics was never more dismally illustrated. To the Irish people it was the first breach of faith in connexion with the Union, and they threw themselves into a settlement into which they believed themselves to have been drawn under false pretences. Pitt, realizing this, had no option but to resign.

The resignation of the great minister who had so long held the reins of power coincided with a critical situation in Europe. The isolation of Bonaparte in Egypt, as the result of Nelson's victory of the Nile (1798), had enabled the allies to recover some of the ground lost to France. But this had merely increased Bonaparte's prestige, and on his return in 1799 he found no difficulty in making himself master of France by the coup d'état of the 18th Brumaire. The campaign of Marengo followed (1800) and the peace of Lunéville, which not only once more isolated Great Britain, but raised up against her new enemies, to the list of whom she added Russia and Austria. France now set her face on England, and the Cape of Good Hope. But though forced, in spite of misgivings, to continue the struggle, the British government in one very important respect was now in a far better position to do so. For though Great Britain was now isolated and her policy in Europe advertised as a failure, the temper of the British people was less inclined to peace in 1798 than it had been three years before. The early enthusiasm of the disfranchised classes for French principles had cooled with the later developments of the Revolution; the attempted invasions had roused the national spirit; and in the public imagination the sinister figure of Bonaparte, the rapacious conqueror, was beginning to loom large to the exclusion of lesser issues. Henceforth, in spite of press prosecutions and trials for political libel, the government was supported by public opinion in its vigorous prosecution of the war.

The Act of Union with Ireland.

The peace of Amiens.

The recall of the war.

The peace of Amiens. The British government had of carrying out the spirit of the treaty, refused to abandon Malta, as she had engaged to do by the terms of peace. The war began again, no longer a war against revolutionary principles and their propaganda, but against the boundless ambitions of a military conqueror. This time the British nation was all but unanimous in resistance. This time its resistance would be sooner or later supported by all that was healthy in Europe. The news that Bonaparte was making preparations on a vast scale for the invasion of England roused a stubborn spirit of resistance in the country. Volunteers were enrolled, and the coast was dotted with Martello towers, many of which yet remain as monuments of the time when the "army of England" was encamped on the heights near Boulogne within sight of the English cliffs. To meet so great a crisis Addington was not the man. He had been ceaselessly assailed, in and out of parliament, by the trenchant criticism, and often unmanfully wit, of "Pitt's friends," among whom George Canning was now conspicuous. Pitt himself had remained silent; but in view of the seriousness of the crisis and of a threatened illness of the king, which would have necessitated a regency and—in view of the recent change of the Duke of York—would have necessitated permanent exclusion from office, he now put himself forward once more. The government majorities in the House now rapidly dwindled; on the 26th of April 1804, Addington resigned; and Pitt, after his attempt to form a national coalition ministry had broken...
down on the king's refusal to admit Fox, became head of a government constructed on a narrow Tory basis. Of the members of the late government Lord Eldon, the duke of Portland, Lord Westmorland, Lord Castlereagh and Lord Hawkesbury retained office, the latter surrendering the place of foreign secretary to his friend Canning, and moving to the home office. Dundas, now Lord Melville, became first lord of the admiralty, and the cabinet further included Lord Camden, Lord Mulgrave and the duke of Montrose. Canning, Huskisson and Perceval were given subordinate offices.

Save for the commanding personality of Pitt, the new government was scarcely stronger than that which it had replaced. It had to face the same Whig opposition, led by Fox, who scoffed at the French peril, and reinforced by Addington and his friends; and the whole burden of meeting this opposition fell upon Pitt; for Castlereagh, the only other member of the cabinet in the House of Commons, was of little use in debate. Nevertheless, fresh vigour was infused into the conduct of the war. The Additional Forces Act, passed in the teeth of a strenuous opposition, introduced the principle of a modified system of conscription to supplement the deficiencies of the army and reserve, which had largely increased. Abroad, Pitt's whole energies were directed to forming a fresh coalition against Bonaparte, who, on the 14th of May 1804, had proclaimed himself emperor of the French; but it was a year before Russia signed with Great Britain the treaty of St. Peters burg (April 11, 1805), and the accession to the coalition of Austria, Sweden and Naples was not obtained till the following September. In the following month (October 21), Nelson's crowning victory at Trafalgar over the allied fleets of France and Spain followed England of the dread of invasion. It served, however, to precipitate the crisis on the continent of Europe; the great army assembled at Boulogne was turned eastwards; by the capitulation of Ulm (October 19) Austria lost a large part of her forces; and the last news that reached Pitt on his death-bed was that of the ruin of all his hopes by the crushing victory of Napoleon over the Russians and Austrians at Austerlitz (December 2).

Pitt died on the 23rd of January, and the refusal of Lord Hawkesbury to assume the premiership forced the king to summon Lord Grenville, and to agree to the inclusion of Fox in the cabinet as secretary for foreign affairs. Several members of Pitt's administration were admitted to this "Ministry of all the Talents," including Addington (now Lord Sidmouth), who had rejoined the ministry in December 1804 and again resigned, owing to a disagreement with Pitt as to the charges against Lord Melville (q.v.) in July 1805. The new ministry remained in office for a year, a disastrous year which saw the culmination of Napoleon's power: the crushing of Prussia in the campaign of Jena, the formation of the Confederation of the Rhine and the end of the Holy Roman Empire. In the conduct of the war the British government had displayed little skill, frittering away its forces on distant expeditions, instead of concentrating them in support of Prussia or Russia, and the chief title to fame of the Ministry of all the Talents is that it secured the passing of the bill for the abolition of the slave-trade (March 25, 1807).

The death of Fox (September 13, 1806) deprived the ministry of its strongest member, and in the following March it fell on the old question of concessions to the Roman Catholics. True to his principles, Fox had done his best to negotiate terms of peace with Napoleon; but the breakdown of the attempted negotiations as to terms of capitulation was impossible, and in view of this fact Grenville thought it his duty to advise the king that the disabilities of Roman Catholics and dissenters in the matter of serving in the army and navy should be removed, in order that all sections of the nation might be united in face of the enemy. The situation, moreover, was in the highest degree anomalous; for by an act passed in 1793 Roman Catholics might hold commissions in the army in Ireland up to the rank of colonel, and this right had not been extended to England, though by the Act of Union the armies had become one. The king, however, was not to be moved from his position; and he was supported in this attitude not only by public opinion, but by a section of the ministry itself, of which Sidmouth made himself the mouthpiece. The demand for Catholic emancipation, in the shape of a bill, was brought in by the second Lord Cowper, and in the following year to approach him on the subject of concessions to the Catholics was rejected by Grenville, rightly, as unconstitutional, and on the 18th of March 1807 he resigned.

The new ministry, under the nominal headship of the val etudianer duke of Portland, included Perceval as chancellor of the exchequer, Canning as foreign secretary and Castlereagh as secretary for war and the colonies. It had given the undertaking demanded by the king; those of its members who, like Canning, were in favour of Catholic emancipation, arguing that, in view of greater and more pressing questions, it was useless to insist in a matter which could never be settled so long as the old king lived. Of more importance to Great Britain, for the time being, than any constitutional issues, was the life- and-death struggle with Napoleon, which had now entered on a new phase. Defeated in sea, in land and now of the greater part of the continent of Europe, the French emperor planned to bring Great Britain to terms by ruining her commerce with the vast territories under his influence. In November 1806 he issued from Berlin the famous decree prohibiting the importation of British goods and excluding from the harbours under his control even neutral ships that had touched at British ports. The British government replied by the famous Orders in Council of 1807, which declared all vessels trading with France liable to seizure, and that all such vessels clearing from France must touch at a British port to pay customs duties. To this Napoleon responded with the Milan decree (December 17), forbidding neutrals to trade in any articles imported from the British dominions. The effects of these measures were destined to be far-reaching. The Revolution had made war on princes and privilege, and the common people had in general gained wherever the Napoleonic régime had been substituted for their effete despotisms; but the "Continental System" was felt as an oppression in every humble household, suddenly deprived of the little imported luxuries, such as sugar and coffee, which custom had made necessary; and from this time date the beginnings of that popular revolt against Napoleon that was to culminate in the War of Liberation. Great Britain, too, was to suffer from her own retaliatory policy. The Americans had taken the grave matter of war to heart, and at home, as in the colonies, had taken advantage of the war to draw into their own hands a large part of the British carrying trade, a process greatly encouraged by the establishment of the Continental System. This brought them into conflict with the British acting under the Orders in Council, and the consequent ill-feeling culminated in the war of 1812.

It was not only the completion of the Continental System, however, that made the year 1807 a fateful one for Great Britain. On the 7th of July the young emperor Alexander I. of Russia, fascinated by Napoleon's genius and bribed by the offer of a partition of the world, concluded the treaty of Tilsit, which not only brought Russia into the Continental System, but substituted for a coalition against France a formidable coalition against England. A scheme for wresting from the British the command of the sea was only defeated by Canning's action in ordering the English fleet to capture the Danish navy, though Denmark was still nominally a friendly power. The ministers should have attempted to complete the ring fence round Europe against British commerce, Napoleon had ordered Junot to invade Portugal; Lisbon was occupied by the French, and the Portuguese royal family migrated to Brazil. In the following year Napoleon seized the royal family of Spain, and gave the crown, which Charles VI. resigned on behalf of himself and his heir, to his brother Joseph, king of Naples. The revolt of the Spanish people that followed was the first of

The Orders in Council.

Peace with America.

Treaty of Tilsit.
the national uprisings against his rule by which Napoleon was destined to be overthrown. In England it was greeted with immense popular enthusiasm, and the government, without realizing the full import of the step it was taking, sent an expedition to the Peninsula. It disembarked, under the command of Sir Arthur Wellesley, at Figueras on the 1st of August. It was the beginning of the Peninsula War, which was destined not to end until, in 1814, the British troops crossed the Pyrenees into France, while the Allies were pressing over the Rhine. The political and military events on the continent of Europe do not, however, belong strictly to English history, though they profoundly affected its development, and they are dealt with elsewhere (see EUROPE: HISTORY; NAPOLEON; NAPOLEONIC CAMPAIGNS; PENINSULAR WAR; WATERLOO CAMPAIGN).

The war, while it lasted, was of course the main preoccupation of British ministers and of the British people. It entailed enormous sacrifices, which led to corresponding distress and suffering, and frequent friction within the government itself. A cabinet crisis was the result of the outcome of the unfortunate Walcheren expedition of 1809. It had been Castlereagh’s conception and, had it been as well executed as it was conceived, it might have dealt a fatal blow at Napoleon’s hopes of recovering his power at sea, by destroying his great naval establishment at Toulon. It is not without reason that angry dispute between Canning and Castlereagh, a dispute embittered by personal rivalry and the friction due to the ill-defined relations of the foreign secretary to the secretary for war; the quarrel culminated in a duel, and in the resignation of both ministers (see LONDON, 2d Marquess of, and CANNING, GEORGE). The duke of Portland resigned at the same time, and in the reconstruction of the ministry, under Perceval as prime minister, Lord Wellesley became the foreign secretary, while Lord Liverpool, with Palmerston as his under-secretary, succeeded Castlereagh at the war office.

The most conspicuous member of this government was Wellesley, whose main object in taking office was to second his brother’s efforts in the Peninsula. In this he was, however, only partially successful, owing to the incapacity of his colleagues to realize the unique importance of the operations in Spain. In November 1810 the old king’s mind gave way, and on the 11th of February 1811, an act of parliament bestowed the regency, under certain restrictions, upon the prince of Wales. The prince had been on intimate terms with the Whig leaders, and it was assumed that his accession to power would mean a change of government. He had, however, been offended by their attitude on the question of the restriction of his authority as regent, and he continued Perceval in office. A year later, the king’s insanity being proved incurable, the regency was definitely established (February 1812). Lord Wellesley took advantage of the reconstruction of the cabinet to resign a position in which he had not been given a free hand, and his post of foreign secretary was offered to Canning. Canning, however, refused to serve with Castlereagh as minister of war, and the latter received the foreign office, which he was to hold till his death in 1822. A month later, on the 11th of May, Perceval was assassinated in the lobby of the House of Commons, and Lord Liverpool became the head of a government that was to last till 1827.

The period covered by the Liverpool administration was a fateful one in the history of Europe. The year 1812 saw Napoleon’s invasion of Russia, and the disastrous retreat from Moscow. In the following year Wellington’s victory at Vitoria signalled the ruin of the French cause in Spain; while Prussia threw off the yoke of France, and Austria, realizing after cautious delay her chance of retrieving the humiliations of 1809, joined the alliance, and in concert with Russia and the other German powers overthrew Napoleon at Leipzig. The invasion of France followed in 1814, the abdication of Napoleon, the restoration of the Bourbons and the assembling of the congress of Vienna. The following year saw the return of Napoleon from Elba, the close of the congress of Vienna, and the campaign that ended with the battle of Waterloo. The succeeding period, after so much storm and stress, might seem dull and unprofitable; but it witnessed the instructive experiment of the government of Europe by a concert of the great powers, and the first victory of the new principle of nationality in the insurrection of the Greeks. The share taken by Great Britain in all this, for which Castlereagh pre-eminentely must take the credit, is like that which the history of Europe (q.v.). Here it must suffice to point out how closely the development of foreign affairs was interwoven with that of home politics. The great war, so long as it lasted, was the supreme affair of moment; the supreme interest when it was over was to prevent its recurrence. For above all the world needed peace, in order to recover from the exhaustion of the revolutionary epoch; and this peace, bought at so great a cost, could be preserved only by the honest co-operation of Great Britain in the great international alliance based on “the treaties.” This explains Castlereagh’s policy at home and abroad. He was grossly attacked by the Opposition in parliament and by irresponsible critics, of the type of Byron, outside; historians, bred in the atmosphere of mid-Victorian Liberalism, have re-echoed the cry against him and the government of which he was the most distinguished member; but history has largely justified his conduct and it became clear that he judged it better that “oppressed nationalities” and “persecuted Liberals” should suffer than that Europe should be again plunged into war. He was hated in his day as the arch-opponent of reform, yet the triumph of the reform movement would have been impossible but for the peace his policy secured.

To say this is not to say that the attitude of the Tory government towards the great issues of home politics was wholly consistent, for it had been inspired by a fainthearted wisdom. Castlereagh, who had departed widely from the Toryism of Pitt’s younger years, which had sought to base itself on popular support, as opposed to the aristocratic exclusiveness of the Whigs. It conceived itself as the trustee of a system of government which, however theoretically imperfect, alone of the governments of Europe had survived the storms of the Revolution intact. To tamper with a constitution that had so proved its quality seemed not so much a sacrilege as a folly. The rigid conservatism that resulted from this attitude served, indeed, a useful purpose in giving weight to Castlereagh’s counsels in the European concert; for Metternich at least, wholly occupied with “propping up mouldering institutions,” could not have worked harmoniously with a minister suspected of an itch for reform. At home, however, it undoubtedly tended to provoke that very revolution which it was intended to prevent. This was due not so much to the notorious corruption of the representative system as to the fact that it represented social and economic conditions that were rapidly passing away.

Both Houses of Parliament were in the main assemblies of aristocrats and landowners; but agriculture was ceasing to be the characteristic industry of the country and the old semi-feudal relations of life were in process of rapid dissolution. The invention of machinery and the concentration of the working population in manufacturing centres had all but destroyed the old village industries, and great populations were growing up outside the traditional restraints of the old system of class dependence. The distress inevitable in connexion with such an industrial revolution was increased by the immense burden of the war and by the high protective policy of the parliament, which restricted trade and deliberately increased the price of food in the interests of the agricultural classes. Between 1811 and 1814 bands of starving operatives, driven out of work, scoured the country, smashing machinery—the immediate cause of their misfortunes—and committing every sort of outrage. The fault of the government lay, not in taking vigorous measures for the suppression of these disorders, but in remaining obstinately blind to the true causes that had produced them.
Ministers saw in the Luddite organization only another conspiracy against the state; and, as far from seeking means for removing the grievances that underlay popular dissatisfaction, the activity of parliament, inspired by the narrowest class interests, only tended to increase them. The price of food, already raised by the war, was still further increased by successive Corn Laws, and the artificial value thus given to arable land led to the passing of the Enclosure Bills, under which the country people were deprived of their common rights with very inadequate compensation, and life in the villages became more and more difficult. In the circumstances it is not surprising that the spirit of unrest grew apace. In 1812 the passing of a new Corn Law, forbidding the importation of corn so long as the price for home-grown wheat was under 80s. a quarter, led to riots in London. An attack made on the prince regent at the opening of parliament on the 28th of January 1817 led to an inquiry, which revealed the existence of an elaborate organization for the overthrow of the existing order. The repressive measures of 1795 and 1799 were now revived and extended. A bill suspending the habeas corpus for a year was passed through both Houses by a large majority.

On the 27th of March Lord Sidmouth opened the government campaign against the press by issuing a circular to the lords-lieutenants, directing them to instruct the justices of the peace to issue warrants for the arrest of any person charged on oath with publishing blasphemous or seditious libels. The legality of this suggestion was more than doubtful, for it was not the less act of on a series of preventive arrests; there was, some— as in the case of the bookseller William Home—on grounds so trivial that juries refused to convict. William Cobbett, the most influential of the reform leaders, in order to avoid arbitrary imprisonment, "deprived of pen, ink and paper," suspended the Political Register and sailed for America. A disturbance that was almost an armed insurrection, which broke out in Derbyshire in June of this year, seemed to justify the severity of the government; it was suppressed without great difficulty, and three of the ringleaders were executed. It was, however, in 1810 that the conflict between the government and the new popular forces culminated. Distress was acute; and in the manufacturing towns mass meetings were held to discuss a remedy, which, under the guidance of political agitators, was discovered in universal suffrage and annual parliaments. The right to return members to parliament was claimed as a fundamental right. It was only seven years after this right was constitutionally withheld, unrepresented towns were invited to exercise it in anticipation of its formal concession. At Birmingham, accordingly, Sir Charles Wolseley was duly elected "legislative attorney and representative" of the town. Manchester followed suit; but the meeting arranged for the 28th of August was declared illegal by the magistrates, on the strength of a royal proclamation against seditious meetings issued on the 30th of July. Another meeting was accordingly summoned for the undoubtedly legal purpose of petitioning parliament in favour of reform. On the appointed day (August 16) thousands poured in from the surrounding districts. These men had been previously drilled, for the purpose, as their own leaders asserted, of enabling the vast assemblage to be conducted in an orderly manner; for the purpose, as the magistrates suspected, of preparing them for an armed insurrection. An attempt was made by a party of yeomanry to arrest a popular agitator, Henry Hunt; the angry mob round the house was powerless; the Riot Act was read, and the 15th Hussars charged the crowd with drawn swords. The meeting rapidly broke up, but not before six had been killed and many injured. The "Manchester Massacre" gave an immense impetus to the movement in favour of reform. The employment of soldiers to suppress liberty of speech stirred up the resentment of Englishmen as nothing else could have done, and this resentment was increased by the conviction that the government was engaged with the "Holy Alliance" in an unholy conspiracy against liberty everywhere. The true tendency of Castlereagh's foreign policy was not understood, nor had he any of the popular arts which would have enabled Canning to carry public opinion with him in cases where a frank explanation was impossible. The Liberals could see no more than that he appeared to be committed to international engagements, the logical outcome of which might be—as an orator of the Opposition put it—that Cossacks would be encamped in Hyde Park for the purpose of overawing the House of Commons.

The dangerous agitation that gave expression to this state of feeling was met by the government in the session of November 1812 by the passing of the famous Six Acts. The first of these deprived the defendant of the right of traversing, but directed that he should be brought to trial within a year; the second increased the penalties for seditious libel; the third imposed the newspaper stamp duty on all pamphlets and the like containing news; the fourth (Seditious Meetings Act) once more greatly curtailed the liberty of public meetings; the fifth forbade the training of persons in the use of arms; the sixth empowered magistrates to search for and seize arms.

The apparent necessity for the passing of these exceptional measures was increased by the imminent death of the old king, the tragic close of whose long reign had won for him a measure of popular sympathy which was wholly lacking in the case of the prince regent. On the 23rd of February 1820 George III died, and the regent became king as George IV. This was the signal for an outburst of discontent. The existing order was that of far more ominous character than any that had preceded it. The King was generally loathed, not so much for his vices—which would have been, in this case as in others, condoned in a more popular monarch—but for the notorious meanness and selfishness of his character. Of these qualities he took the occasion of his accession to make a fresh display. He had long been separated from his wife, Caroline of Brunswick; he now refused her the title of queen consort, forbade the mention of her name in the liturgy, and persuaded the government to promote an inquiry in parliament into her conduct, with a view to a divorce. Whatever grounds there may have been for this action, popular sympathy was wholly with Queen Caroline, who became the centre round which all the forces of discontent rallied. The failure of the Bill of Pains and Penalties against the queen, which was dropped after it had passed its third reading in the Lords by a majority of seven, was regarded as a great popular triumph. The part played by the government in this unsavoury affair had discredited them even in the eyes of the classes whose fear of revolution had hitherto made them supporters of the established system; and the movement for reform received a new stimulus. The Tory government itself realized the necessity for some concessions to the growing popular sentiment. In 1821 a small advance was made. The reform bill (equal electoral districts) introduced by Lambton (afterwards Lord Durham) was thrown out; but the corrupt borough of Grampound in Cornwall was disfranchised and the seats transferred to the county of York. Even more significant was the change in the cabinet, which was strengthened by the admission of some of the more conservative section of the Opposition, Lord Sidmouth retiring and Robert Peel becoming home secretary. A bill for the removal of Catholic disabilities, too, was carried in the Commons, though rejected in the Lords; and the appointment of Lord Wellesley, an advocate of the Catholic claims, to the lord-lieutenancy of Ireland marked yet another stage in the settlement of a question which, more than anything else at that time, kept Ireland and Irishmen in a state of chronic discontent and agitation.

It is not without significance that this modification of the policy of the Tory government at home coincided with a modification of its relations with the European powers. The tendency of Metternich's system had long been growing distasteful to Castlereagh, who had consistently protested against the attempt to constitute the Grand Alliance general policy of Europe and
had specially protested against the Carlsbad Decrees (q.v.). The first steps towards the inevitable breach with the reactionary powers had already been taken before Castlereagh's tragic death on the eve of the congress of Verona brought George Canning into office as the executor of his policy. With Canning, foe of the Revolution and all its works though he was, the old liberal Toryism of Pitt's younger days seemed once more to emerge. It might have emerged in any case; but Canning, with his brilliant popular gifts and his frank appeal to popular support, gave it a reviving stimulus which it would never have received from an aristocrat of the type of Castlereagh.

The new spirit was most conspicuous in foreign affairs; in the protest of Great Britain against the action of the continental powers at Verona (see VERONA, CONGRESS OF), in the recognition of the South American republics, and later in the sympathetic attitude of the government towards the insurrection in Greece. This policy had been foreshadowed in the instructions drawn up by Castlereagh for his own guidance at Verona; but Canning succeeded in giving it a popular and national colour and thus removing from the government all suspicion of sympathy with the reactionary spirit of the "Holy Alliance." In home affairs, too, the government made tentative advances in a Liberal direction. In January 1823 Vanstätt was succeeded as chancellor of the exchequer by Fox, afterwards Lord Goderich, and Huskisson became president of the Board of Trade. The office of the latter was marked by the first tentative efforts to modify the high protective system by which British trade was hampered, especially by the Reciprocity of Duties Act (1823), a modification of the Navigation Acts, by which British and foreign shipping were placed on an equal footing, while the right to impose restrictive duties on ships of powers refusing to reciprocate was retained. In spite, however, of the improvement in trade that ultimately resulted from these measures, there was a great depression; in 1825 there was a financial crisis that caused widespread ruin, and in 1826 the misery of the labouring poor led to renewed riots and machinery smashing. It became increasingly clear that a drastic alteration in the existing system was absolutely inevitable. As to this necessity, however, the ministry was in fact hopelessly divided. The government was one of compromise, in which even so burning a question as Catholic emancipation had been left open. Among its chief supporters were—like the lord chancellor Eldon, the duke of Wellington, and the premier, Lord Liverpool, himself—whose Toryism was of the type crystallized under the influence of the Revolution, adamantly against change. Such progressive measures as it had passed had been passed in the teeth of its own nominal supporters, even of its own members. In 1836 Lord Palermo, himself a member of the government, wrote: "On the Catholic question, on the principles of commerce, on the corn laws, on the settlement of the currency, on the laws relating to trade in money, on colonial slavery, on the game laws...; on all these questions, and everything like them, the government will find support from the Whigs and resistance from their self-denominated friends." It was, in fact, only the personal influence of Liverpool that held the ministry together, and when, on the 17th of February 1827, he was seized with an apoplectic fit, a crisis was inevitable.

The crisis, indeed, arose before the nominal expiration of the Liverpool administration. Two questions were, in the view of Canning and his supporters, of supreme importance—Catholic emancipation and the reform of the Corn Laws. The first of these had assumed a new urgency since the formation in 1823 of the Catholic Association, which under the brilliant leadership of Daniel O'Connell established in Ireland a national organization that threatened the very basis of the government. In March 1826 Sir Francis Burdett had brought in a Catholic Relief Bill, which, passed in the Commons, was thrown out by the Lords. A year later Burdett's motion that the affairs of Ireland required immediate attention, though supported by Canning, was rejected in the Commons. A bill modifying the Corn Laws, introduced by Canning and Huskisson, passed the House of Commons on the 12th of April 1827, but was rejected by the Lords.

Meanwhile (April 10) Canning had become prime minister, his appointment being followed by the resignation of all the most conspicuous members of the Liverpool administration: Wellington, Eldon, Melville, Bathurst, Westminster and Peel, the latter of whom resigned on account of his opposition to Catholic emancipation. The new government had perforce to rely on the Whigs, who took their seats on the government side of the House, Lord Lansdowne being included in the cabinet. Before this coalition could be completed, however, Canning died (August 8). The short-lived Goderich administration followed; and in January 1828 the king, weary of the effort to arrange a coalition, summoned the duke of Wellington to office as head of a purely Tory cabinet. Yet the logic of facts was too strong even for the stubborn spirit of the Iron Duke. In May 1828, on the initiative of Lord John Russell, the Test and Corporation Acts were repealed; in the same session a Corn Bill, differing but little from those that Wellington had hitherto opposed, was passed; and finally, after a strenuous agitation which culminated in the election of O'Connell for Clare, and in spite of the obstinate resistance of King George IV., the Catholic Emancipation Bill was passed (April 10, 1829) by a large majority. On the 20th of June 1830 the king died, exactly a month before the outbreak of the revolution in Paris that hurled Charles X. from the throne and led to the establishment of the Liberal monarchy under Louis Philippe; a revolution that was to exert a strong influence on the movement for reform in England.

King William IV. ascended the throne at a critical moment in the history of the English constitution. Everywhere misery and discontent were apparent, manifesting themselves in riots against machinery, in rye-burning on a large scale, and in the formation of trades unions which tended to develop into organized armies of sedition. All the elements of violent revolution were present. Nor was there anything in the character of the new king greatly calculated to restore the damaged prestige of the crown; for, if he lacked the evil qualities that had caused George IV. to be loathed as well as despised, he lacked also the sense of personal dignity and the imperial bearing in which he saw the greatness of his ancestors' reigns. The ministry under Lord Grey, the ministry also including a few of the more liberal Tories. Lord Durham, perhaps the most influential leader of the reform movement, became privy seal, Althorp chancellor of the exchequer, Palmerston foreign secretary, Melbourne home secretary, Goderich colonial secretary. Lord John Russell, as paymaster-general, and Stanley (afterwards Lord Derby), as secretary for Ireland, held office outside the cabinet. With the actual House of Commons, however, the government was powerless to effect its purpose. Though it succeeded in carrying the second reading of the Reform Bill (March 21, 1831), it was defeated in committee, and appealed to the country. The result was a great governmental majority, and the bill passed the Commons in September. Its rejection by the Lords on the 8th of October was the signal for dangerous rioting; and in spite of the opposition of the king, the bill was once more passed by the Commons (December 12). A violent agitation marked the recess. On the 14th of April 1832 the bill was read second time in the Lords, but on the 7th of May it was again rejected, whereupon the government resigned. The attempt of Wellington, at the king's instance, to form a ministry failed; of all the Tory obstructionists he alone had the courage to face the popular rage. On the 15th Lord Grey was in office again; the demand was made for a sufficient creation of peers to swamp
the House of Lords; the king, now thoroughly alarmed, used his influence to persuade the peers to yield, and on the 4th of June the great Reform Bill became law. Thus was England spared the crisis of a bloody revolution, and proof given to the world that her ancient constitution was sufficiently elastic to expand with the needs of the times.

The effect of the Reform Bill, which abolished fifty-six "corporations" set free by rent, some of the other set free 143 seats, which were in part conferred on the new industrial centres, was to transfer a large share of political power from the landed aristocracy to the middle classes. Yet the opposition of the Tories had not been wholly inspired by the desire to maintain the political predominance of a class. Canning, who had the best reason for knowing, defended the unreformed system on the ground that its very anomalies opened a variety of paths by which talent could make its way into parliament, and thus produced an assembly far more widely representative than could be expected from a more uniform and logical system.

This argument, which the effect of progressive extensions of the franchise on the intellectual level of parliament has certainly not tended to weaken, was however far outweighed—as Canning himself would have come to see—by the advantage of reconciling with the old constitution the new forces which were destined during the century to transform the social organization of the country. Nor, it might be added, did it in effect constitute a revolution. The 143 seats set free were divided equally between the towns and the counties; and in the counties the landowning aristocracy was still supreme.

In the towns the new £10 household franchise secured a democratic constitution; in the counties the inclusion of tenants at will (of £50 annual rent), as well as of copyholders and leaseholders, only tended to increase the influence of the landlords. There was as yet no secret ballot to set the voter free.

The result was not apparent in the courts of the next few years. The first reformed parliament, which met on the 29th of January 1833, consisted in the main of Whigs, with a sprinkling of Radicals and a compact body of Liberal Tories under Sir Robert Peel. Its great work was the act emancipating the slaves in the British colonies (August 30). Other burning questions were the condition of Ireland, the scandal of the established church there, the misery of the poor in England. In all these matters the House showed little enough of the revolutionary temper; so little, indeed, that in March Lord Durham resigned. To the Whigs leaders the church was all but as sacrosanct as to the Tories, the very foundation of the constitution, not to be touched save at imminent risk to the state; the most they would adventure was to remedy a few of the more glaring abuses of an establishment imposed on an unwilling population. As for O'Connell's agitation for the repeal of the Union, that met with but scant sympathy in parliament; on the 27th of May 1834 his repeal motion was rejected by a large majority.

In July the Grey ministry resigned, and on the 16th Lord Melbourne became prime minister. His short tenure of office is memorable for the passing of the bill for the reform of the Poor Law (August). The reckless system of outdoor relief, which had pauperized whole neighbourhoods, was abolished, and the system of unions and workhouses established (see Poor Law). An attempt to divert some of the revenues of the Church held in the autumn in serious differences of opinion in the cabinet; the king, as taciturn as his father of the exact obligations of his coronation oath, dismissed the ministry, and called the Tories to office under Sir Robert Peel and the duke of Wellington. Thus, within three years of the passing of the Reform Bill, the party which had most strenuously opposed it was again in office. Scarcely less striking testimony to the constitutional temper of the English was given by the new attitude of the party under the new conditions. In the first years of the Whigs' and by reducing the burden of the Reform Bill. The "conservative" party. The Reform Bill and its consequences were frankly accepted; further reforms were promised, especially in the matter of the municipal corporations and of the disabilities of the dissenters.

The new parliament, however, which met on the 10th of February, was not favourable to the ministry, which fell on the 8th of April. Lord Melbourne once more came into office, and the Municipal Corporations Act of the 7th of September was the work of a Liberal government. This was the last measure of first-rate importance passed before the death of King William, which occurred on the 20th of March 1837.

It is impossible to exaggerate the importance, not only for England but for the world at large, of the epoch which culminated in the passing of the Reform Bill of 1832. All Europe, whether Liberal or reactionary, was watching the constitutional struggle with strained attention; the principles of monarchy and of constitutional liberty were alike at stake. To foreign observers it seemed impossible that the British monarchy could survive. Baron Brunnow, the Russian ambassador in London, sent home to the emperor Nicholas I. the most pessimistic reports. According to Brunnow, King William, by using his influence to secure the passage of the Reform Bill, had "cast his crown into the gutter"; the throne might endure for his lifetime, but the next heir was a young and inexperienced girl, and, even were the princess Victoria ever to mount the throne—which was unlikely—she would be speedily swept off it again by the rising tide of republicanism. The course of the next reign was destined speedily to show the character of these fears, and to present to all Europe the exemplar of a progressive state, in which the principles of traditional authority and democratic liberty combined for the common good.

(W. A. F.)

XII. THE REIGN OF VICTORIA (1837-1901)

The death of William IV., on the 20th of June 1837, placed on the throne of England a young princess, who was destined to reign for a longer period than any of her predecessors. The new queen, the only daughter of the Duke of Kent, the fourth son of George III., had just attained her majority. Educated in comparative seclusion, her character and her person were unfamiliar to her future subjects, who were a little weary of the extravagances and eccentricities of her immediate predecessors. Her accession gave them a new interest in the house of Hanover. And their loyalty, which would in any case have been excited by the accession of a young and inexperienced girl to the throne of the greatest empire in the world, was stimulated by her conduct and appearance. She displayed from the first a dignity and good sense which won the affection of the multitude who merely saw her in public, and the confidence of the advisers who were admitted into her presence.

The ministry experienced immediate benefit from the change. The Whigs, who had governed England since 1850, under Lord Grey and Lord Melbourne, were suffering from the reaction which is the inevitable consequence of revolution. The country which, in half-a-dozen years, had seen a radical reform of parliament, a no less radical reform of municipal corporations, the abolition of slavery, and the reconstruction of the poor laws, was longing for a period of political repose. The alliance, or understanding, between the Whigs and the Irish was increasing dangerous. The Whigs, remembering the Whigs were a party. The Whig cabinet. The "conservative" party. The Reform Bill and its consequences were frankly accepted; further reforms were promised, especially in the matter of the municipal corporations and of the disabilities of the dissenters.

The new parliament, however, which met on the 10th of February, was not favourable to the ministry, which fell on the 8th of April. Lord Melbourne once more came into office, and the Municipal Corporations Act of the 7th of September was the work of a Liberal government. This was the last measure of first-rate importance passed before the death of King William, which occurred on the 20th of March 1837.

It is impossible to exaggerate the importance, not only for England but for the world at large, of the epoch which culminated in the passing of the Reform Bill of 1832. All Europe, whether Liberal or reactionary, was watching the constitutional struggle with strained attention; the principles of monarchy and of constitutional liberty were alike at stake. To foreign observers it seemed impossible that the British monarchy could survive. Baron Brunnow, the Russian ambassador in London, sent home to the emperor Nicholas I. the most pessimistic reports. According to Brunnow, King William, by using his influence to secure the passage of the Reform Bill, had "cast his crown into the gutter"; the throne might endure for his lifetime, but the next heir was a young and inexperienced girl, and, even were the princess Victoria ever to mount the throne—which was unlikely—she would be speedily swept off it again by the rising tide of republicanism. The course of the next reign was destined speedily to show the character of these fears, and to present to all Europe the exemplar of a progressive state, in which the principles of traditional authority and democratic liberty combined for the common good.

XII. THE REIGN OF VICTORIA (1837-1901)

The death of William IV., on the 20th of June 1837, placed on the throne of England a young princess, who was destined to reign for a longer period than any of her predecessors. The new queen, the only daughter of the Duke of Kent, the fourth son of George III., had just attained her majority. Educated in comparative seclusion, her character and her person were unfamiliar to her future subjects, who were a little weary of the extravagances and eccentricities of her immediate predecessors. Her accession gave them a new interest in the house of Hanover. And their loyalty, which would in any case have been excited by the accession of a young and inexperienced girl to the throne of the greatest empire in the world, was stimulated by her conduct and appearance. She displayed from the first a dignity and good sense which won the affection of the multitude who merely saw her in public, and the confidence of the advisers who were admitted into her presence.

The ministry experienced immediate benefit from the change. The Whigs, who had governed England since 1850, under Lord Grey and Lord Melbourne, were suffering from the reaction which is the inevitable consequence of revolution. The country which, in half-a-dozen years, had seen a radical reform of parliament, a no less radical reform of municipal corporations, the abolition of slavery, and the reconstruction of the poor laws, was longing for a period of political repose. The alliance, or understanding, between the Whigs and the Irish was increasing dangerous. The Whigs, remembering the
obtain the assent of the House of Lords to its Irish measures. It had desired (1) to follow up the reform of English corporations by a corresponding reform of Irish municipalities; (2) to convert the tithes, payable to the Irish Church, into a rent charge, and to appropriate its surplus revenues to other purposes; (3) to deal with the chronic distress of the Irish people by extending to Ireland the principles of the English poor law. In the year which succeeded the accession of the queen it accomplished two of these objects. It passed an Irish poor law and a measure commuting tithes in Ireland into a rent charge. The first of these measures was carried in opposition to the views of the Irish, who thought that it imposed an intolerable burden on Irish property. The second was only carried on the government consenting to drop the appropriation clause, on which Lord Melbourne’s administration had virtually been founded.

It was not, however, in domestic politics alone that the ministry was hampered. In the months which immediately followed the queen’s accession news reached England of disturbances, or even insurrection in Canada. The rising was easily put down; but the condition of the colony was so grave that the ministry decided to suspend the constitution of lower Canada for three years, and to send out Lord Durham with almost dictatorial powers. Lord Durham’s conduct was, unfortunately, marked by indiscretions which led to his resignation; but before leaving the colony, he drew up a report of taxation, on which future, which practically became a textbook for his successors, and has influenced the government of British colonies ever since. Nor was Canada the only great colony which was seething with discontent. In Jamaica the planters, who had sullenly accepted the abolition of slavery, were irritated by the passage of an act of parliament intended to remedy some grave abuses in the management of the prisons of the island. The colonial House of Assembly denounced this act as a violation of the constitution, and determined to desist from its legislative functions. The governor dissolved the assembly, but the new house, elected in its place, reaffirmed the decision of its predecessor; and the British ministry, in face of the crisis, asked parliament in 1839 for authority to suspend the constitution of the island for five years. The bill introduced for this purpose placed the Whig ministry in a position of some embarrassment. The advocates of popular government, they were inviting parliament, for a second time, to suspend representative institutions in an important colony. Supported by only small and dwindling majorities, they saw that it was hopeless to carry the measure, and they decided on placing their resignations in the queen’s hands. The queen naturally sent for Sir Robert Peel, who undertook to form a government. In the course of the negotiations, however, he stated that it would be necessary to make certain changes in the household, which contained some great ladies closely connected with the leaders of the Whig party. The queen shrank from separating herself from ladies who had surrounded her since she came to the throne, and Sir Robert thereupon declined the task of forming a ministry. Technically he was justified in adopting this course, but people generally felt that there was some hardship in compelling a young queen to separate herself from her companions and friends, and they consequently approved the decision of Lord Melbourne to support the queen in her refusal, and to resume office. The Whigs returned to place, but they could not be said to return to power. They did not even venture to renew the original Jamaica Bill. They substituted for it a modified proposal which they were unable to carry. They were obviously indebted for office to the favour of the queen, and not to the support of parliament.

Yet the session of 1839 was not without important results. After a long struggle, in which ministers narrowly escaped defeat in the Commons, and suffered severe rebuffs in the Lords, they succeeded in laying the foundation of the English system of national education. In the same session they were forced against their will to adopt a reform, which had been recommended by Rowland Hill, and to confer on the nation the benefit of a uniform penny postage. No member of the cabinet foresaw the consequences of this reform. The postmaster-general, Lord Lichfield, in opposing it, declared that, if the revenue of his office was to be maintained, the correspondence of the country, on which postage was paid, must be increased from 42,000,000 to 480,000,000 letters a year, and he contended that there were neither people to write, nor machinery to deal with, so prodigious a volume of letters. He would have been astonished to hear that, before the end of the century, his office had to deal with more than 3,000,000 postal packets a year, and that the net profit which it paid into the exchequer was to be more than double what it received in 1839.

In 1840 the ministry was not much more successful than it had proved in 1839. After years of conflict it succeeded indeed in placing on the statute book a measure dealing with Irish municipalities. But its success was purchased by concessions to the Lords, which deprived the measure of much of its original merit. The closing years of the Whig administration were largely occupied with the financial difficulties of the country. The first three years of the queen’s reign were memorable for a constantly deficient revenue. The deficit amounted to £1,400,000 in 1837, to £4,000,000 in 1838, and to £1,457,000 in 1839. Baring, the chancellor of the exchequer, endeavoured to terminate this deficiency by a general reduction of taxation, but this attempt was unsuccessful. The deficit rose to £1,842,000 in 1840. It was obvious that the old expedient of increasing taxation had failed, and that some new method had to be substituted for it. This new method Baring tried to discover in altering the differential duties on timber and sugar, and substituting a fixed duty of 8s. per quarter for the sliding duties hitherto payable on wheat. By these alterations he expected to secure a large increase of revenue, and to maintain at the same time sufficient degree of protection for colonial produce. The Conservatives, who believed in protection, at once attacked the proposed alteration of the sugar duties. They were reinforced by many Liberals, who cared very little for protection, but a great deal about the abolition of slavery, and consequently objected to reducing the duties on foreign or slave-grown sugar. This combination of interests proved too strong for Baring and his proposal was rejected. As minister, however, he did not resign on their defeat, Sir Robert Peel followed up his victory by investing himself with the office of prime minister, and this motion was carried in an exceptionally full house by 312 votes to 311.

Before abandoning the struggle, the Whigs decided on appealing from the House of Commons to the country. The general election which ensued largely increased the strength of the Conservative party. On the meeting of the new parliament in August 1841, votes of want of confidence in the government were proposed and carried in both houses; the Whigs were compelled to resign office, and the queen again charged Sir Robert Peel with the task of forming a government. If the queen had remained unmarried, it is possible that the friction which had arisen in 1839 might have recurred in 1841. In February 1840, however, Her Majesty had married her cousin, Prince Albert of Saxe-Coburg-Gotha. She was, therefore, no longer dependent on the Whig ladies, to whose presence in her court she had attached so much importance in 1839. By the management of the prince—who later in the reign was known as the prince consort—the great ladies of the household voluntarily tendered their resignations; and every obstacle to the formation of the new government was in this way removed.

Thus the Whigs retired from the offices which, except for a brief interval in 1834—1835, they had held for eleven years. During the earlier years of their administration they had succeeded in carrying many memorable reforms: during the later years their weakness in the House of Commons had prevented their passing any considerable measures. But, if they had failed in this respect, Lord Melbourne had rendered conspicuous service to the queen. Enjoying her full confidence, consulted by her on every occasion, he had always used his influence for the public
good; and perhaps those who look back now with so much satisfaction at the queen's conduct during a reign of unexampled length, imperfectly appreciate the debt which in this respect is owed to her first prime minister. The closing years of the Whig government were marked by external complications in the shape of the controversy on the boundary of Canada and the United States, which provoked increasing bitterness on both sides of the Atlantic. The intervention of Lord Palmerston in Syria, which resulted in a great military success at Acre, was embittering the relations between France and England, while the unfortunate expedition to Afghanistan, which the Whigs had approved, was already producing embarrassment, and was about to result in disaster. Scarcely were the complications which surrounded British policy in Europe, in the East, and in America, the country, in August 1841, paid more attention to what a great writer called the "condition of England" question. There had never been a period in British history when distress and crime had been so general. There had hardly ever been a period when food had been so dear, when wages had been so low, when poverty had been so widespread, and the condition of the lower orders so depraved and so hopeless, as in the early years of the queen's reign. The condition of the people had prompted the formation of two great associations. The Chartists derived their name from the charter which set out their demands. The rejection of a monster petition which they presented to parliament in 1839 led to a formidable riot in Birmingham, and to a projected march from South Wales to London, in which twenty persons were shot dead at Newport. Another organization, in one sense even more formidable than the Chartist, was agitating at the same time for the repeal of the corn laws, and was known as the Anti-Corn Law League. It had already secured the services of two men, Cobden and Bright, who, one by clear reasoning, the other by fervid eloquence, were destined to make a profound impression on all classes of the people.

The new government had, therefore, to deal with a position of almost unexampled difficulty. The people were apparently sinking into deeper poverty and misery year after year. As an outward and visible sign of the inward distress, the state was no longer able to pay its way. It was estimated that the deficit, which had amounted to £1,842,000 in 1840, would reach £2,334,000 in 1841. It is the signal merit of Sir Robert Peel that he terminated this era of private distress and public deficits. He accomplished this task partly by economical administration—for no minister ever valued economy more—and partly by a reform of the financial system, effected in three great budgets. In the budget of 1841 Sir Robert Peel terminated the deficit by reviving the income tax. The proceeds of the tax, which was fixed at 7d. in the £, and was granted in the first instance for three years, were more than sufficient to secure this object. Sir Robert used the surplus to reform the whole customs tariff. The duties on raw materials, he proposed, should never exceed 5%, the duties on partly manufactured articles 12%, and the duties on manufactured articles 20% of their value. At the same time he reduced the duties on stage coaches, on foreign and colonial coffee, on foreign and colonial timber, and repealed the export duties on British manufactures. The success of this budget in stimulating consumption and in promoting trade induced Sir Robert Peel to follow it up in 1845 with an even more remarkable proposal. Instead of allowing the income tax to expire, he induced parliament to continue it for a further period, and with the resources which were thus placed at his disposal he purged the tariff of various small duties which pachged little revenue, and had been imposed for purposes of protection. He swept away all the duties on British exports; he repealed the duties on glass, on cotton wool, and still further reduced the duties on foreign and colonial sugar. This budget was a much greater step towards free trade than the budget of 1842. The chief object in his third budget in 1846—the reduction of the duty on corn to 1s. a quarter—was necessitated by causes which will be immediately referred to. But it will be convenient at once to refer to its other features. Sir Robert Peel told the house that, in his previous budgets, he had given the manufacturers of the country free access to the raw materials which they used. He was entitled in return to call upon them to relinquish the protection which they enjoyed. He decided, therefore, to reduce the protective duties on cotton, woollen, silk, and other goods, as well as on raw materials, in the shape of heavy taxation, such as timber and tallow. As the policy of 1842 and 1845 had proved unquestionably successful in stimulating trade, he proposed to extend it to agriculture. He reduced the duties on the raw materials which the farmers used, such as seed and maize, and in return he called on them to give up the duties on cattle and meat, to reduce largely the duties on butter, cheese and hops, and to diminish the duty on corn by 3s. a quarter. In making these changes, Sir Robert Peel avowed that it was his object to make the country a cheap one to live in. There is no doubt that they were followed by a remarkable development of British trade. In the twenty-seven years from 1815 to 1842 the export trade of Great Britain diminished from £49,600,000 to £47,280,000; while in the twenty-seven years which succeeded 1842 it increased from £47,280,000 to nearly £190,000,000. These figures are a simple and enduring monument to the minister's memory. It is fair to add that the whole increase was not due to free trade. It was partly attributable to the remarkable development of communications which marked this period.

Two other financial measures of great importance were accomplished in Sir Robert Peel's ministry. In 1844 some £250,000,000 of the national debt still bore an interest of 3%. The improvement in the credit of the country enabled the government to reduce the interest on the stock to 2 1/2% for the succeeding ten years, and to 3% afterwards. This conversion, which effected an immediate saving of £925,000, and an ultimate saving of £1,250,000 a year, was by far the most important measure which had hitherto been applied to the debt; and no operation on the same scale was attempted for more than forty years. In the same year the necessity of renewing the charter of the Bank of England afforded Sir Robert Peel an opportunity of reforming the currency. He separated the issue department from the banking department of the bank, and decided that in future it should only be at liberty to issue notes against (1) the debt of £14,000,000 due to it from the government, and (2) any bullion actually in its coffers. Few measures of the past century have been the subject of more controversy than this famous act, and at one time its repeated suspension in periods of financial crisis seemed to suggest the necessity of its amendment. But opinion on the whole has vindicated its wisdom, and it has survived all the attacks which have been made upon it.

The administration of Sir Robert Peel is also remarkable for its Irish policy. The Irish, under O'Connell, had constantly supported the Whig ministry of Lord Melbourne. But their alliance, or understanding, with the Whigs had not procured them all the results which they had expected from it. The two great Whig measures, dealing with the church and the municipalities, had only been passed after years of controversy, and in a shape which deprived them of many expected advantages. Hence arose a notion in Ireland that nothing was to be expected from a British parliament, and hence began a movement for the repeal of the union which had been accomplished in 1801. This agitation, which smouldered during the reign of the Whig ministry, was rapidly revived when Sir Robert Peel entered upon office. The Irish contributed large sums, which were known as repeal rent, to the cause, and they held monster meetings in various parts of Ireland to stimulate the demand for repeal. The ministry met this campaign by coercive legislation regulating the use of arms, by quartering large bodies of troops in Ireland, and by prohibiting a great meeting at Clontarf, the scene of Brian Boru's victory, in the immediate neighbourhood of Dublin. They further decided in 1843 to place O'Connell and some of the leading agitators on their trial for conspiracy and sedition. O'Connell was tried before a jury chosen from a defective panel, was convicted on an indictment which contained many counts, and the court passed sentence without distinguishing between these counts.
These irregularities induced the House of Lords to reverse the judgment, and its reversal did much to prevent mischief. O'Connell's illness, which resulted in his death in 1847, tended also to establish peace. Sir Robert Peel wisely endeavoured to stifle agitation by making considerable concessions to Irish sentiment. He increased the grant which was made to the Roman Catholic College at Maynooth; he established three colleges in the north, south and west of Ireland for the denominational education of the middle classes; he appointed a commissioner in the Devon commission, as it was called, from the name of the nobleman who presided in it;—a measure of conditions on which Irish land was held; and, after the report of the commission, he introduced, though he failed to carry, a measure for remedying some of the grievances of the Irish tenants. These wise concessions might possibly have had some effect in pacifying Ireland, if, in the autumn of 1845, they had not been forgotten in the presence of a disaster which suddenly fell on that unhappy country. The potato, which was the sole food of at least half the people of an overcrowded island, failed, and a famine of unprecedented proportions was obviously imminent. Sir Robert Peel, whose original views on protection had been rapidly yielding to the arguments afforded by the success of his own budgets, concluded that it was impossible to provide for the necessities of Ireland without suspending the corn laws; and that, if they were once suspended, it would be equally impossible to restore them. He failed, however, to convince two prominent members of his cabinet, Lord Stanley and the duke of Bukhara;—protection must be finally abandoned, and considering it hopeless to persevere with a disunited cabinet he resigned office. On Sir Robert's resignation the queen sent for Lord John Russell, who had led the Liberal party in the House of Commons with conspicuous ability for more than ten years, and charged him with the task of forming a new ministry. Differences, which it proved impossible to remove, between two prominent Whigs—Lord Palmerston and Lord Grey—made the task impracticable, and after an interval Sir Robert Peel consented to resume power. Sir Robert Peel was probably aware that his fall had been only postponed. In the four years and a half during which his ministry had lasted he had done much to estrange his party. They said, with some truth, that, whether his measures were right or wrong, they were opposed to the principles which he had been placed in power to support. The general election of 1847, in which the main issue was the rival policies of protection and free trade. The country had decided in favour of protection, and Sir R. Peel had done more than all his predecessors to give it free trade. The Conservative party, moreover, was closely allied with the church, and Sir Robert had offended the church by giving an increased endowment to Maynooth, and by establishing denominational colleges—"godless colleges" as they were called—in Ireland. The Conservatives were, therefore, sullenly discontented with the conduct of their leader. They were lashed into positive fury by the proposal which he was now making to abolish the corn laws. Lord George Bentinck, who, in his youth, had been private secretary to Canning, but who in his mature years had devoted more time to the turf than to politics, placed himself at their head. He was assisted by a remarkable man—Benjamin Disraeli—who joined great abilities to great ambition, and who, embittered by Sir Robert Peel's neglect to appoint him to office, had already displayed his animosity to the minister. The policy on which Sir Robert Peel resolved facilitated attack. For the minister thought it necessary, while providing against famine by repealing the corn laws, to ensure the preservation of order by a new coercion bill. The financial bill and the coercion bill were both pressed forward, and each gave opportunities for discussion and, what was then new in parliament, for obstruction. At last, on the very night on which the fiscal proposals of the ministers were accepted by the Lords, the coercion bill was defeated in the Commons by a combination of Whigs, radicals and protectionists; and Sir R. Peel, worn out with a protracted struggle, placed his resignation in the queen's hands.

Thus fell the great minister, who perhaps had conferred more benefits on his country than any of his predecessors. The external policy of his ministry had been almost as remarkable as its domestic programme. When he accepted office the country was on the eve of a great disaster in India; it was engaged in a serious dispute with the United States; and its relations with France were so strained that the two great countries of western Europe seemed unlikely to be able to settle their differences without war. In the earlier years of his administration the disaster in Afghanistan was avoided; he planned a campaign; but was prevented from it—a suggestion. The governor-general, who was sent over to replace Lord Auckland as governor-general, increased the dominion and responsibilities of the East India Company by the unscrupulous but brilliant policy which led to the conquest of Sind. The disputes with the United States were satisfactorily composed; and not only were the differences with France terminated, but a perfect understanding was formed between the two countries, under which Guizot, the prime minister of France, and Lord Aberdeen, the foreign minister of England, agreed to compromise all minor questions for the sake of securing the paramount object of peace. The good understanding was so complete that a disagreeable incident in the Sandwich Islands, in which the injudicious conduct of a French agent very nearly precipitated hostilities, was amicably settled; and the ministry had the satisfaction of knowing that, if their policy had produced prosperity at home, it had also maintained peace abroad.

On Sir R. Peel's resignation the queen again sent for Lord John Russell. The difficulties which had prevented his forming a ministry in the previous year were satisfactorily arranged, and Lord Palmerston accepted the seals of the foreign office, while Lord Grey was sent to the colonial office. The history of the succeeding years was destined, however, to prove that Lord Grey had had solid reasons for objecting to Lord Palmerston's return to his old post; for, whatever judgment may ultimately be formed on Lord Palmerston's foreign policy, there can be little doubt that it did not tend to the maintenance of peace. The first occasion on which danger was threatened arose immediately after the installation of the new ministry on the question of the Spanish marriages. The queen of Spain, Isabella, was a young girl still in her teens; the heir to the throne was her younger sister, the infanta Fernanda. Diplomacy had long been occupied with the marriages of this crown; and the sovereign of this country had virtually accepted the principle, which the French government had laid down, that a husband for the queen should be found among the descendants of Philip V, and that her sister's marriage to the duc de Montpensier—a son of Louis Philippe—should not be celebrated till the queen was married and had issue. While agreeing to this compromise, Lord Aberdeen declared that he regarded the Spanish marriages as a Spanish, and not as a European question, and that, if it proved impossible to find a suitable consort for the queen among the descendants of Philip V, Spain must be free to choose a prince for her throne elsewhere. The available descendants of Philip V were the two sons of Don Francis, the younger brother of Don Carlos, and of these the French government was in favour of the elder, while the British government refused the younger brother. Lord Palmerston strongly objected to the prince whom the French government supported; and, almost immediately after acceding to office, he wrote a despatch in which he enumerated the various candidates for the queen of Spain's hand, including Prince Leopold of Saxe-Coburg, a near relation of the prince consort, among the number. Louis Philippe regarded this despatch as a departure from the principle on which he had agreed with Lord Aberdeen, and at once hurried on the simultaneous marriages of the queen with the French candidate, and of her sister with the duc de Montpensier. His action broke up the entente cordiale which had been established between Guizot and Lord Aberdeen.

The second occasion on which Lord Palmerston's vigorous diplomacy excited alarm arose out of the revolution which broke out almost universally in Europe in 1848. A rising in Hungary
was suppressed by Austria with Russian assistance, and after its suppression many leading Hungarians took refuge in Turkish territory. Austria and Russia addressed demands to the Porte for their surrender. Lord Palmerston determined to support the Porte in its refusal to give up these exiles, and actually sent the British fleet to the Dardanelles with this object. His success raised the credit of Great Britain and his own reputation. The presence of the British fleet, however, at the Dardanelles suggested to the Porte the whole of the work, which the locality of the controversy. For years British subjects settled in Greece had raised complaints against the Greek government. In particular Don Pacfico, a Jew, but a native of Gibraltar, complained that, at a riot, in which his house had been attacked, he had lost jewels, furniture and papers which he alleged to be worth more than £30,000. As Lord Palmerston was unable by correspondence to induce the Greek government to settle claims of this character, he determined to enforce them; and by his orders a large number of Greek vessels were seized and detained by the British fleet. The French government tendered its good offices to compose the dispute, and an arrangement was actually arrived at between Lord Palmerston and the French minister in London. Unfortunately, before its terms reached Greece, the British minister at Athens had ordered the resumption of hostilities, and had compelled the Greek government to submit to more humiliating conditions. News of this settlement excited the strongest feelings both in Paris and London. In Paris, Prince Louis Napoleon, who had acceded to the presidency of the French republic, decided on recalling his representative from the British court. In London the Lords passed a vote of censure on Lord Palmerston's proceedings; and the Commons only sustained the minister by adopting a resolution approving in general terms the principles on which the foreign policy of the country had been conducted. Pursuing the vigorous policy which characterized his tenure of the office, Lord Palmerston frequently omitted to consult his colleagues in the cabinet, the prime minister, or the queen. In the course of 1849 Her Majesty formally complained to Lord John Russell that important despatches were sent off without her knowledge; and an arrangement was made under which Lord Palmerston undertook to submit every despatch to the queen through the prime minister. In 1850, after the Don Pacfico debate, the queen repeated these commands in a much stronger memorandum. But Lord Palmerston, though all confidence between himself and the court was destroyed, continued in office. In the autumn of 1851 the queen was much annoyed at hearing that he had received a deputation at the foreign office, which had waited on him to express sympathy with the Hungarian refugees, and to denounce the conduct of "the despots and tyrants" of Russia and Austria, and that he had, in his reply, expressed his gratification at the demonstration. If the queen had had her way, Lord Palmerston would have been removed from the foreign office after this incident. A few days later the coup d'etat in Paris led to another dispute. The cabinet decided to do nothing that could wear the appearance of interference in the internal affairs of France; but Lord Palmerston, in conversation with the French minister in London, took upon himself to say that the civilized world would decide what was right. The ministry naturally refused to tolerate this conduct, and Lord Palmerston was summarily removed from his office.

The removal of Lord Palmerston led almost directly to the fall of the Whig government. Before relating, however, the exact occurrences which produced its defeat, it is necessary to retrace our steps and describe the policy which it had pursued in internal matters during the six years in which it had been in power. Throughout that period the Irish famine had been its chief anxiety and difficulty. Sir Robert Peel had attempted to deal with it (1) by purchasing large quantities of Indian corn, which he had retailed at low prices in Ireland, and (2) by enabling the grand jury to employ the people on public works, which were to be paid out of moneys advanced by the state, one-half being ultimately repayable by the locality. These measures were not entirely successful. It was found, in practice, that the sale of Indian corn at low prices by the government checked the efforts of private individuals to supply food; and that the offer of comparatively easy work to the poor at the cost of the public, prevented their seeking harder private work either in Ireland or in Great Britain. The new government, with this experience before it, decided on trusting to private enterprise to supply the necessary food, and on throwing the whole cost of the work, which the locality might undertake, on local funds. If the famine had been less severe, this policy might possibly have succeeded. Universal want, however, paralysed every one. The people, destitute of other means of livelihood, crowded to the relief works. In the beginning of 1847 nearly 750,000 persons—or nearly one person out of every ten in Ireland—were so employed. With such vast multitudes to relieve, it proved impracticable to exact the labour which was required as a test of destitution. The roads, which it was decided to make, were blocked by the labourers employed upon them, and by the stones, which the labourers were supposed to crush for their repair. In the presence of this difficulty the government decided, early in 1847, gradually to discontinue the relief works, and to substitute for them relief committees charged with the task of feeding the people. At one time no less than 3,000,000 persons—more than one-third of the entire population of Ireland—were supported by these committees. At the same time it decided on adopting two measures of a permanent character. The poor law of 1838 had made no provision for the relief of the poor outside the workhouse, and outdoor relief was sanctioned by an act of 1847. Irish landlords complained that their properties, ruined by the famine, and encumbered by the extravagances of their predecessors, could not bear the cost of this new poor law; and the ministry introduced and carried a measure enabling the embarrassed owners of life estates to sell the property and discharge their liabilities. It is the constant misfortune of Ireland that the measures intended for her relief aggravate her distress. The encumbered estates act, though it substituted a solvent for an insolvent proprietor, placed the Irish tenants at the mercy of landlords of whom they had no previous knowledge, who were frequently absentee proprietors, who bought the land as a matter of business, and who dealt with it on business principles by raising the rent. The new poor law, by throwing the maintenance of the poor on the soil, encouraged landlords to extricate themselves from their responsibilities by evicting their tenants. Evictions were made on a scale which elicited from Sir Robert Peel an expression of the deepest abhorrence. The unfortunate persons driven from their holdings and forced to seek a refuge in the towns, in England, or—when they could afford it—in the United States, carried with them everywhere the seeds of disease, the constant handmaid of famine.

Famine, mortality and emigration left their mark on Ireland. In four years, from 1845 to 1849, its population decreased from 8,205,000 to 7,256,000, or by more than a million persons; and the decline which took place at that time went on to the end of the century. The population of Ireland in 1901 had decreased to 4,457,000 souls. This fact is the more remarkable, because Ireland is almost the only portion of the British empire, or in which such a great change has occurred. We must go to countries like the Asiatic provinces of Turkey, devastated by Ottoman rule, to find such a diminution in the numbers of the people as was seen in Ireland during the last half of the 19th century. It was probably inevitable that the distress of Ireland should have been followed by a renewal of Irish outrages. A terrible series of agrarian crimes was committed in the autumn of 1847; and the ministry felt compelled, in codperation with the House of Commons, to strengthen its laws by new measures of coercion, and by suspending the Habeas Corpus Act in Ireland. The latter measure at once brought to a crisis the so-called rebellion of 1848, for his share in which Smith O'Brien, an Irish member of parliament, was convicted of high treason. The government, however, did not venture to carry out the grim sentence which the law still applied.
to traitors, and introduced an act enabling it to commute the
dearth penalty to transportation. The "insurrection" had from
the first proved abortive. With Smith O'Brien's transportation
it practically terminated.

In the meanwhile the difficulties which the government was
experiencing from the Irish famine had been aggravated by a
great commercial crisis in England. In the autumn of 1847 a
serious crisis was reached. The great commercial centres created a panic
in the city of London, which forced consols down to 78, and
induced the government to take upon itself the responsibility
of suspending the Bank Charter Act. That step, enabling the
directors of the Bank of England to issue notes unsecured by
bullion, had the effect of gradually restoring confidence. But a
great commercial crisis of this character is often attended with
other than financial consequences. The stringency of the money
market increases the distress of the industrial classes by diminish-
ing the demand for work; and, when labour suffers, political
agitation flourishes. Early in 1848, moreover, revolutions on
the continent produced a natural craving for changes at home.
Louis Philippe was driven out of Paris, the emperor of Austria
was driven out of Vienna, the Austrian soldiery had to withdraw
from Milan, and even in Berlin the crown had to make terms
with the people. While thrones were falling or tottering in
every country in Europe, it was inevitable that excitement in political
demands would increase. The Chartists, reviving the
machinery which they had endeavoured to employ in 1839,
decided on preparing a monster petition to parliament, which
was to be escorted to Westminster by a monster procession.
Their preparations excited general alarm, and on the invitation
of the government no less than 170,000 special con-
stables were sworn in to protect life and property
against the rabble. By the judicious arrangements, however,
which were made by the duke of Wellington, the peace of the
metropolis was secured. The Chartists were induced to abandon
the procession which had caused so much alarm, and the monster
petition was carried in a cab to the House of Commons. There
it was mercilessly picked to pieces by a select committee. It
was found that, instead of containing nearly 6,000,000 signatures,
as its originators had boasted, less than 2,000,000 names were
attached to it. Some of the names, moreover, were obviously
fictitious, or even absurd. The exposure of these facts turned
the whole thing into ridicule, and gave parliament an excuse
for postponing measures of organic reform which might otherwise
have been brought forward.

If the ministry thus abstained from pressing forward a large
scheme of political reform, it succeeded in carrying two measures
of the highest commercial and social importance. In
1849 it supplemented the free trade policy, which
since Peel had developed, by the repeal of the Navigation Acts. Briefly stated, these acts, which had been
originated during the Protectorate of Cromwell, and continued
after the Restoration, reserved the whole coasting trade of the
country for British vessels and British seamen, and much of the
foreign trade for British vessels, commanded and chieffly manned
by British subjects. The acts, therefore, were in the strictest
sense protective, but they were also designed to increase the
strength of Great Britain at sea, by maintaining large numbers of
men of war. They had been sanctioned by a body of
peers in 1653, and by the government was the basis of the defence. They had been considered as a "protection of
opulence," and by the same reasoning they had been described
by John Stuart Mill as, "though economically disadvantageous,
politically expedient." The acts, however, threw a great
burden on British trade and British shippers. Their provisions
by restricting competition naturally tended to raise freights,
and by restricting employment made it difficult for shipowners
to man their vessels. Accordingly, the government was only
determined on their repeal; and one of the last and greatest
camels between Free Trade and Protection was fought over the
question. The second reading of the government bill was carried
in the House of Lords by a majority of only ten: it would not
have been carried at all if the government had not secured a
much larger number of proxies than their opponents could obtain.

If the repeal of the Navigation Acts constituted a measure of the
highest commercial importance, the passage of the Ten
Hours Bill in 1847 marked the first great advance in
factory legislation. Something, indeed, had already
been done to remedy the evils arising from the em-
ployment of women and very young children in factories and
workshops. In 1819, under a law known as Lord John
Russell's Factory Act of 1819, had carried the first important Factory Act. In 1842 he had
succeeded, with the help of the striking report of a royal com-
mission, in inducing parliament to prohibit the employment
of women and of boys under ten years of age in mines. And in
1843 Sir James Graham, who was home secretary in Sir Robert
Peel's administration, had been compelled by the pressure of
public opinion to introduce a measure providing for the education
of children employed in factories, and for limiting the hours of
work of children and young persons. The educational clauses
of this bill were obviously framed in the interests of the Church
of England, and raised a heated controversy which led to the
abandonment of the measure; and in the following year Sir
James Graham introduced a new bill dealing with the labour
question alone. Briefly stated, his proposal was that no child
under nine years of age should be employed in a factory, and that
no young person under eighteen should be employed for more
than six hours. The measure gave rise to the most
intense controversy on the ten hours bill, which commenced in 1844
and was protracted till 1847. Lord Ashley and the factory
reformers contended, on the one hand, that ten hours were long
enough for any person to work; their opponents maintained,
on the contrary, that the adoption of the clause would injure
the working-classes by lowering the rate of wages, and ruin
the manufacturers by exposing them to foreign competition. In
1847 the reform was at last adopted. It is a remarkable fact
that it was carried against the views of the leading statesmen
on both sides of the House. It was the triumph of common sense
over official arguments.

During the first four years of Lord John Russell's government,
his administration had never enjoyed any very large measure
of popular support, but it had been partly sustained
by the advocacy of Sir Robert Peel. The differences
which estranged Sir Robert from his old supporters
were far greater than those which separated him from the Whigs,
and the latter were therefore constantly able to rely on his
assistance. In the summer of 1850, however, a lamentable
accident—a fall from his horse—deprived the country of the
services of its great statesman. His death naturally affected
the position of parties. The small remnant of able men, indeed,
who had been associated with him in his famous administration,
still maintained an attitude of neutrality. But the bulk of the
country, which had discovered by the reign of Queen Victoria
(afterwards Derby) in the House of Lords, and gradually sub-
mitted to, rather than accepted, the lead of Disraeli in the
House of Commons.

In the autumn which succeeded Sir Robert Peel's death, an
event which had not been foreseen agitated the country and
produced a crisis. During the years which had suc-
ceeded the Reform Bill a great religious movement
took place. It was a movement of the middle classes, which	had influenced politics both in England and Scotland.
The Oxford movement. The movements of the Anglican Church in Oxford—of whom J. H.,
afterwards Cardinal, Newman was the chief, but who numbered
among their leaders Hurrell Froude, the brother of the historian,
and Keble, the author of the Christian Year—endeavoured to
prove that the doctrines of the Church of England were identical
with those of the primitive Catholic Church, and that every
Catholic doctrine might be held by those who were within its
pale. This view was explained in a remarkable series of tracts,
which gave their name to the Tractarians. The most
famous of these, and the last of the series, Tract XC., was
published three years after the queen's accession to the throne.
In Scotland, the Presbyterian Church—mainly under the guidance
of Dr Chalmers, one of the most eloquent preachers of the century
was simultaneously engaged in a contest with the state on the
subject of ecclesiastical patronage. Both movements had this
in common, that they indicated a revival of religious energy, and aimed at vindicating the authority of the church, and resisting the interference of the state in church matters. The Tractarian movement led to the disruption of the Church of Scotland and the formation of the Free Church in 1843. The Tractarian movement was ultimately terminated by the secession of Newman and many of his associates from the Church of England, and their admission to the Church of Rome. These secessions raised a feeling of alarm throughout England. The people, thoroughly Protestant, were excited by the proofs—which they thought were afforded—that the real object of the Tractarians was to reconcile England with Rome; and practices which are now regarded as venial or even praiseworthy—such as the wearing of the surplice in the pulpit, and the institution of the weekly oratory—were denounced because they were instituted by the Tractarians, and were regarded as insidious devices to lead the country Romeward.

The sympathies of the Whigs, and especially of the Whig prime minister, Lord John Russell, were with the people; and Lord John displayed his dislike to the Romanizing tendencies of the Tractarians by appointing Renn Dickson Hampden—whose views had been formally condemned by the Hebdomadal Board at Oxford—to the bishopric of Hereford. The High Church party endeavoured to oppose the appointment at every stage; but their attempts exposed them to a serious defeat. The courts held that, though the appointment of a bishop by the crown required confirmation in the archbishop’s court, the confirmation was a purely ministerial act which could not be refused. The effect which the High Church party had for allaying it, and John Russell decided on asking the parliament to sanction increased armaments, and to raise the income tax to 1s. in the pound in order to pay for them. The occasion desires to be recollected as one on which a prime minister, who was not also chancellor of the exchequer, has himself proposed the budget of the year. But it was still more memorable because the remedy which Lord John proposed at once destroyed the panic which had suggested it. A certain increase of the income tax to a shilling seemed a much more serious calamity than the uncertain prospect of a possible invasion. The estimates were recast, the budget was withdrawn, and the nation was content to dispense with any addition to its military and naval strength. Events in France, in the meanwhile, moved with railway speed. Louis Napoleon became president of the French Republic: in 1852 he became emperor of the French. The new emperor, indeed, took pains to reassure a troubled舆论, and said that “the empire was made for all nations.” The people insisted on believing—and, as the event proved, rightly—that the empire was war. Notwithstanding the success of the Great Exhibition of 1851, which was supposed to inaugurate a new reign of peace, the panic, which had been temporarily allayed in 1848, revived at the close of 1851, and the government endeavoured to allay it by reconstituting the militia. There were two possible expedients. An act of 1857 had placed under the direct authority of the crown a militia composed of men selected in each parish by ballot, liable to be called out for active service, and to be placed under military law. But the act had been supplemented by a series of statutes passed between 1808 and 1812, which had provided a local militia, raised, like the regular militia, by ballot, but, unlike the latter, only liable for service for the suppression of riots, or in the event of imminent invasion. Lord John Russell’s government, forced to do something by the state of public opinion, but anxious—from the experience of 1848—to make that something moderate, decided on reviving the local militia. Lord Palmerston at once suggested that the regular and not the local militia should be revived; and, in a small house of only 265 members, he succeeded in carrying a resolution to that effect. He had, in this way, what he called his “tit for tat” with Lord John; and the queen, accepting her minister’s resignation, sent for Lord Derby—for Lord Stanley had now succeeded to this title—and charged him with the task of forming a ministry.

The government which Lord Derby succeeded in forming was composed almost exclusively of the men who had rebelled against Sir Robert Peel in 1845. It was led in the House of
Commons by the brilliant, but somewhat unscrupulous statesman who had headed the revolt. With the exception of Lord Derby and one other man, its members had no experience of high office; and it had no chance of commanding a majority of the House of Commons in the existing parliament. It owed its position to the divisions of its opponents. Profiting by their experience, it succeeded in framing and passing a measure reconstituting the regular militia, which obtained general approval. It is perhaps worth observing that it maintained the machinery of a ballot, but reserved it only in case experience should prove that it was necessary. Voluntary enlistment under the new Militia Bill was to be the rule: compulsory service was only to be resorted to if voluntary enlistment should fail. This success, to a certain extent, strengthened the position of the new ministry. It was obvious, however, that its stability would ultimately be determined by its financial policy. Composed of the men who had resisted the free trade measures of the previous decade, its fate depended on its attitude towards free trade. In forming his administration Lord Derby had found it necessary to declare that, though he was still in favour of a tax on corn, he should take no steps in this direction till the country had received an opportunity of expressing its opinion. His leader in the House of Commons went much further, and declared that the time had gone by for reverting to protection. The view which Disraeli thus propounded in defiance of his previous opinions had been formed by his opponents on the discussion of the scheme. Though the new government obtained some increased strength from the result of the polls, the country, it was evident, had no intention of abandoning the policy of free trade, which by this time, it was clear, had conferred substantial benefits on all classes. When the new parliament met in the autumn of 1852, it was at once plain that the issue would be determined on the rival merits of the old and the new financial systems. Disraeli courted the decision at once by bringing forward a budget, which, custom and perhaps convenience, would have justified him in postponing till the following spring. His proposal—in which he avowedly threw over his friends on the ground that "he had greater subjects to consider than the triumph of obsolete opinions"—was, in effect, an attempt to conciliate his old supporters by a policy of doles, and to find the means for doing so by the increased taxation of the middle classes. He offered to relieve the country at once by transferring to the Consolidated Fund the coast dues, to the Consolidated Fund; the West India interest by sanctioning the refining of sugar in bond; and the landed classes by reducing the malt tax by one-half, and by repealing the old wag duty on hops. He suggested that the cost of these measures should be defrayed by extending the income tax to Ireland to industrial incomes of £100 and to permanent incomes of £50 a year, as well as by doubling the house tax, and extending it to all £50 householders. The weight, therefore, of these measures was either purposely or unintentionally thrown mainly on persons living in houses worth from £10 to £250 a year, or on persons in receipt of incomes from £50 to £150 a year. This defect in the budget was exposed in a great speech by Gladstone, which did much to ensure the defeat of the scheme and the fall of the ministry.

On the resignation of Lord Derby, the queen anxious to terminate a period of weak governments, decided on endeavouring to combine in one cabinet the chiefs of the Whig party and the followers of Sir Robert Peel. With this view she sent both for Lord Aberdeen, who had held the foreign office under Sir Robert, and for Lord Lansdowne, who was the Nestor of the Whigs; and with Lord Lansdowne's concurrence charged Lord Aberdeen with the task of forming a government. In the new ministry Lord Aberdeen became first lord of the treasury, Gladstone chancellor of the exchequer, Lord John Russell foreign minister of his own motion, but immediately replaced in the foreign office by Lord Clarendon, and himself assumed the presidency of the council. Lord Palmerston went to the home office. One other appointment must also be mentioned. The secretary of state for the colonies was also at that time secretary of state for war. No one in 1854, however, regarded that office as of material importance, and it was entrusted by Lord Aberdeen to an amiable and conscientious nobleman, the duke of Newcastle.

The first session of the Aberdeen administration will be chiefly recollected for the remarkable budget which Gladstone brought forward. It constituted a worthy supplement to the measures of 1842, 1845 and 1846. Gladstone swept away the duty on one great necessary of life—soap; he repealed the duties on 133 other articles; he reduced the duties on 133 others, among them that on tea; and he found means for paying for these reforms and for the gradual reduction and ultimate abolition of the income tax, which had become very unpopular, by (i) extending the tax to incomes of £100 a year; (ii) an increase of the spirit duties; and (3) applying the death duties to real property, and to property passing by settlement. There can be little doubt that this great proposal was one of the most striking which had ever been brought forward in the House of Commons; there can also, unhappily, be no doubt that its promises and intentions were frustrated by events which proved too strong for its author. For Gladstone, in framing his budget, had contemplated a continuance of peace, and the country was, unhappily, already drifting into war.

For some years an obscure quarrel had been conducted at Constantinople about the custody of the holy places at Jerusalem. The sultan, relying on the influence which he wielded in the first half of the 1850s, claimed the guardianship of these places for the Latin Church. But the rights which the Latin Church had thus obtained had practically fallen into disuse, while the Greek branch of the Christian Church had occupied and repaired the shrines which the Latins had neglected. In the years which preceded 1853, however, France had shown more activity in asserting her claims; and the new emperor of the French, anxious to conciliate the church which had supported his elevation to the throne, had a Krem Fitliri in Wallachia. If, for reasons of policy, the emperor had grounds for his action, he had personal motives for thwarting the tsar of Russia; for the latter potentate had been foolish enough, in recognizing the second empire, to address its sovereign as "Mon Cher Ami," instead of, in the customary language of sovereigns, as "Monsieur Mon Frère." Thus, at the close of 1852, and in the beginning of 1853, Russia and France were both addressing opposite and hostile arguments to the Porte. The argument of the course of events was that of a demand; the argument of sending of her fleet to the Dardanelles, while Russia was placing an army corps on active service and despatching Prince Menshikov on a special mission to Constantinople. So far the quarrel which had occurred at the Porte was obviously one in which Great Britain had no concern. The Aberdeen ministry, however, thought it desirable that it should be represented in the crisis by a strong man at Constantinople; and it selected Lord Stratford de Redcliffe for the post, which he had filled in former years with marked ability. Whatever merits Lord Stratford possessed—and he stands out in current diplomacy as the one strong man whom England had abroad—there was no doubt that he had this disqualification: the emperor Nicholas had refused some years before to receive him as ambassador at St Petersburg, and Lord Stratford had resented, and never forgiven, the discourtesy of this refusal. Lord Stratford soon discovered that Prince Menshikov was the bearer of larger demands, and that he was requiring the Porte to agree to a treaty acknowledging the right of Russia to protect the Greek Church throughout the Turkish dominions. By Lord Stratford's advice the Porte—while making the requisite concession respecting the holy places—refused to grant the new demand; and Prince Menshikov thereupon withdrew from Constantinople.

The rejection of Prince Menshikov's ultimatum was followed by momentous consequences. Russia—rather her tsar—resolved to the separation of the Caucasian principalities; the British ministry—though the quarrel did not directly concern Great Britain—sent a fleet to the Dardanelles and placed it under Lord Stratford's orders. Diplomacy, however, made a fresh attempt to terminate the dispute, and in July 1853 a note
was agreed upon by the four neutral powers, France, Great Britain, Austria and Prussia, which it was decided to present to Constantinople and St Petersburg. This note, the adoption of which would have ensured peace, was accepted at St Petersburg; at Constantinople it was, unfortunately, rejected, mainly on Lord Stratford's advice, and in opposition to his instructions from home. Instead, however, of insisting on the adoption of the note to which it had agreed, Lord Aberdeen's ministry recommended the tsar to accept some amendments to it suggested by Lord Stratford, which it was disposed to regard as unimportant. It then discovered, however, that the tsar attached a meaning to the original note differing from that which it had itself applied to it, and in conjunction with France it thereupon ceased to recommend the Vienna note—as it was called—for acceptance.

This decision separated the two western powers from Austria and Prussia, who were disposed to think that Russia had done all that could have been required of her in accepting the note which the four powers had agreed upon.

It was obvious that the control of the situation was passing from the hands of the cabinet at home into those of Lord Stratford at Constantinople. The ambassador, in fact, had the great advantage that he knew his own mind; the cabinet laboured under the fatal disadvantage that it had long been unable to make up its mind. Its chief, Lord Aberdeen, was dominated by a desire to preserve peace; but he had not the requisite force to control the stronger men who were nominally serving under him. Lord John Russell was a little sore at his own treatment by his party. He thought that he had a claim to the first place in the ministry, and he did not, in consequence, give the full support to Lord Aberdeen which the latter had a right to expect from him. Lord Palmerston, on the other hand, had no personal grudge to nurture, but he was convinced that the first duty of England was to support Turkey and to resist Russia. He represented in the cabinet the views which Lord Stratford was enforcing at Constantinople, and step by step Lord Stratford, thus supported, drove the country nearer and nearer to war.

In October the Porte, encouraged by the presence of the British fleet in the Bosporus, took the bold step of summoning the Russians to evacuate the principalities. Following up this demand the Turkish troops attacked the Russian army, and inflicted on it one or two sharp defeats. The Russians retaliated by loosing their squadron from Sevastopol, and on the 30th of November it attacked and destroyed the Turkish fleet at Sinope. The massacre of Sinope— as it was rather inaccurately called in Great Britain, for it is difficult to deny that it was a legitimate act of a belligerent power—created an almost irresistible demand for war among the British people. Yielding to popular opinion, the cabinet was present to do its duty. On its way to the Cuban it was determined that the fleet of the allied powers should enter the Black Sea and "invite" every Russian vessel to return to Sevastopol. The decision was taken at an unfortunate hour. Diplomats, pursuing their labours in Vienna, had succeeded in drawing up a fresh note which they thought might prove acceptable both at St Petersburg and at Constantinople. This note was presented almost at the moment the tsar learned that the French and British fleets had entered the Black Sea, and the Russian government, instead of considering it, withdrew its ministers from London and Paris; the French and British ambassadors were thereupon withdrawn from St Petersburg. An ultimatum was soon afterwards addressed to Russia requiring her to evacuate the principalities, and war began. In deciding on war the British government relied on the capacity of its fleet, which was entrusted to the command of Sir Charles Napier, to strike a great blow in the Baltic. The fleet was despatched with the utmost energy, and, as Sir Charles Napier informed me shortly after a most important detail was finished, it was the first time the British government had had the satisfaction of seeing its fleet under arms in the Baltic. It was a most important detail, for it was an event which seemed to have been at the outset of the war by this time excited, and it was loudly demanding something more than a preliminary success. It was resolved to invade the Crimea and attack the great arsenal, Sevastopol, whence the Russian fleet had sailed to Sinope, and in September 1854 the allied armies landed in the Crimea. On the 20th the Russian army, strongly posted on the banks of the Alma, was completely defeated, and it is almost certain that, if the victory had been at once followed up, Sevastopol would have fallen. The commanders of the allied armies, however, hesitated to throw themselves against the forts erected to the north of the town, and decided on the hazardous task of marching round Sevastopol and attacking it from the south. The movement was successfully carried out, but the Allies again hesitated to attempt an immediate assault. The Russians, who were advised by Colonel Tchelten, the only military man who attained a great reputation during the war, thus gained time to strengthen their position by earthworks; and the Allies found themselves forced, with scanty preparations, to undertake a regular siege against an enemy whose force was numerically superior to their own. In the early days of the siege, indeed, the allied armies were twice in great peril. A formidable attack on the 25th October on the British position at Balaklava led to a series of encounters which displayed the Great British and French infallibility to go wrong at the critical moment. A still more formidable sortie on the 5th of November was with difficulty repulsed at Inkerman. And the Russians soon afterwards found, in the climate of the country, a powerful ally. The allied armies, imperfectly organized, and badly equipped for such a campaign, suffered severely from the hardships of a Crimean winter. The whole expedition seemed likely to melt away from want and disease.

The terrible condition of the army, vividly described in the letters which the war correspondents of the newspapers sent home, aroused strong feelings of indignation in Great Britain. When parliament met Roebuck gave notice that he would move for a committee of inquiry. Lord John Russell—who had already vainly urged in the cabinet that the duke of Newcastle should be superseded, and the conduct of the war entrusted to a stronger minister—resigned office. His resignation was followed by the defeat of the government, and Lord Aberdeen, thus driven from power, was succeeded by Lord Palmerston. In selecting him for the post, the queen undoubtedly placed her seal on the wish of the country to carry out the war to the bitter end. But it so happened that the formation of a new ministry was accompanied by a fresh effort to make terms of peace. Before the change of administration a conference had been decided on, and Lord Palmerston entrusted its management to Lord John Russell. While the conference was in session events occurred which seemed at first to facilitate his task. The tsar, worn out with disappointment, suddenly died, and was succeeded by his son Alexander. Unfortunately the conference failed, and the war went on for another year. In September 1855 the allied troops succeeded in obtaining possession of the southern side of Sevastopol, and the emperor of the French, satisfied with this partial success, or alarmed at the expense of the war, decided on withdrawing from the struggle. The attitude of Napoleon made the conclusion of peace only a question of time. In the beginning of 1856 a congress to discuss the terms was assembled at Paris; in February hostilities were suspended; and in April a treaty was concluded. The peace set back the boundaries of Russia from the Danube to the Pruth; it secured the free navigation of the first of these rivers; it opened the Black Sea to the commercial navies of the world, closing it to vessels of war, and forbidding the establishment of arsenals upon its shores. The last condition, to which Great Britain had attached most importance, was not in the treaty for fourteen years. Peace without this provision could undoubtedly have been secured at Vienna, and the prolongation of the war from 1855 to 1856 only resulted in securing this arrangement for a little more than one decade.

The Crimean War left other legacies behind it. The British government had for some time regarded with anxiety the gradual encroachments of Russia in central Asia. Russian
diplomacy was exerting an increasing influence in Persia, and the latter had always coveted the city of Herat, which was popularly regarded as the gate of India. In 1856 the Persian government, believing that England had her hands fully occupied in the Crimes, seized Herat, and, in consequence, a fresh war—in which a British army under Sir James Outram rapidly secured a victory—broke out. The campaign, entered upon when parliament was in recess, was unpromising at the outset. Magee, and the British forces, were beaten in the Battle of the Sutlej in November 1845 but after a memorable siege, was at last taken by a brilliant assault. Lucknow, where a small British garrison was besieged in the residence, was twice relieved, once temporarily by Sir James Outram and General Havelock, and afterwards permanently by Sir Colin Campbell, who had been sent out from England to take the chief command. Subsequent military operations broke up the remnants of the revolt, and in the beginning of 1858 the authority of the queen was restored throughout India. The mutiny, however, had impressed its lesson on the British people, and, as the first consequence, it was decided to transfer the government from the old East India Company to the crown. Lord Palmerston's administration was defeated on another issue before it succeeded in carrying the measure which it introduced for the purpose, though Lord Derby's second ministry, which succeeded it, was compelled to frame its proposals on somewhat similar lines. The home government of India was entrusted to a civil administration; and though the numbers of the council have been reduced, the form of government which was then established has endured. The number which led to the second fall of Lord Palmerston was in one sense unexpected. Some Italian refugees living in London, of whom Orsini was the chief, formed a design to assassinate the emperor of the French. On the evening of 14th January 1858, while the emperor, accompanied by the empress, was driving to the opera, these men threw some bombs under his carriage. The brutal attempt happily failed. Neither the emperor nor the empress was injured by the explosion, but the carriage in which they were driving was wrecked, and a large number of persons who happened to be in the street at the time were either killed or wounded. This horrible outrage naturally created indignation in France, and it unfortunately became plain that the conspiracy had been hatched in England, and that the bombs had been manufactured in London. On these facts becoming known, Count Walewski, the chief of the French foreign office, who was united by ties of blood to the emperor, called on the British government to provide against the danger to which France was exposed. “Ought the right of asylum to protect such a state of things?” he asked. “Is hospitality due to assassins? Ought the British legislature to continue to favour their designs and their plans? And can it continue to shelter persons who by these flagrant acts place themselves beyond the pale of common rights?” Lord Clarendon, the head of the British foreign office, told the French ambassador, who read him this despatch, that “no consideration on earth would induce the British parliament to pass a measure for the extradition of political refugees,” but he added that it was a question whether the law was as complete and as stringent as it should be, and that he stated that the government had already referred the whole subject to the law officers of the crown for consideration. Parliament was deceived by these assertions, and were advised by Gladstone to judge it wise to refrain from giving any formal reply to Count Walewski's despatch, and contented itself with privately communicating to the British ambassador in Paris the difficulties of the British government. After receiving the opinion of the law officers the cabinet decided to introduce a bill into parliament increasing in England the punishment for a conspiracy to commit a felony either within or without the United Kingdom. The first reading of this bill was passed by a considerable majority. But, before the bill came on for a second reading, the language which was being used in France created strong resentment in England. The regiments of the French army sent letters to the emperor congratulating him on his escape and violently denouncing the British people. Some of these addresses, which were published in the Moniteur, spoke of London as "an
assassins' den," and invited the emperor to give his troops the order to destroy it. Such language did not make it easier to alter the law in the manner desired by the government. The House of Commons, reflecting the spirit of the country, blamed Lord Clarendon for neglecting to answer Count Walewski's despatch, and blamed Lord Palmerston for introducing a bill at French dictation. The feeling was so strong that, when the Conspiracy Bill came on for a second reading, a amendment hostile to the government was carried, and Lord Palmerston at once resigned.

For a second time Lord Derby undertook the difficult task of carrying on the work of government without the support of a majority in the House of Commons. If the Liberal party had been united its attempt would have failed immediately. In 1858, however, the Liberal party had no cohesion. The wave of popularity which had carried Lord Palmerston to victory in 1857 had lost its strength. The Radicals, who were slowly recovering the influence they had lost during the Crimean War, regarded even a Conservative government as preferable to his return to power, while many Liberals desired to enthrone the fortunes of their party to the guidance of their former chief, Lord John Russell. It was obvious to most men that the dissensions thus visible in the Liberal ranks could be more easily healed in the cold shade of the opposition benches than in the warmer sunlight of office. And, therefore, though no one had much confidence in Lord Derby, or in the stability of his second administration, every one was disposed to acquiesce in its temporary occupation of office.

Ministries which exist by sufferance are necessarily compelled to adapt their measures to the wishes of those who permit them to continue in power. The second ministry of Lord Derby experienced the truth of this rule. For some years a controversy had been conducted in the legislature in reference to the admission of the Jews to parliament. This dispute had been raised in 1847 into a question of practical moment by the election of Baron Lionel Nathan Rothschild as representative of the City of London, and its importance had been emphasized in 1851 by the return of another Jew, Alderman Salomons, for another constituency. The Liberal party generally in the House of Commons was in favour of such a modification of the oaths as would enable the Jews so elected to take their seats. The bulk of the Conservative party, on the contrary, and the House of Lords, were strenuously opposed to the change. Early in 1856 the House of Commons, by an increased majority, passed a bill amending the oaths imposed by law on members of Parliament, and directing the omission of the words "on the true faith of a Christian" from the oath of abjuration when it was taken by a Jew. If the Conservatives had remained in opposition there can be little doubt that this bill would have shared the fate of its predecessors and have been rejected by the Lords. The lord chancellor, indeed, in speaking upon the clause relieving the Jews, expressed a hope that the peers would not hesitate to pronounce that our "Lord is king, be the people never so impatient." But some Conservative peers realized the importance of maintaining a conflict between the two Houses when the Conservatives were in power; and Lord Lucan, who had commanded the cavalry in the Crimea, suggested as a compromise that either House should be authorized by resolution to determine the form of oath to be administered to its members. This solution was reluctantly accepted by Lord Derby, and Baron Rothschild was thus enabled to take the seat from which he had been so long excluded. Eight years afterwards parliament was induced to take a fresh step in advance. It imposed a new oath from which the words which disqualified the Jews were omitted. The door of the House of Lords was thus thrown open, and in 1858 Baron Nathan Mayer Rothschild, raised to the peerage, was enabled to take his seat in the upper chamber.

This question was not the only one on which a Conservative government, without a majority at its back, was compelled to make concessions. For some years past a growing disposition had been displayed among the more earnest Liberals to extend the provisions of the Reform Act of 1832. Lord John Russell's ministry had been defeated in 1851 on a proposal of Locke King to place £10 householders in counties on the same footing as regards the franchise as £10 householders in towns, and Lord John himself in 1854 had actually introduced a new Reform Bill. After the general election of 1857 the demand for reform increased, and, in accepting office in 1858, Lord Derby thought it necessary to declare that, though he had maintained in opposition that the settlement of 1832, with all its anomalies, afforded adequate representation to all classes, the promises of previous governments and the expectations of the people imposed on him the duty of bringing forward legislation on the subject. The scheme which Lord Derby's government published was, however, peculiar. His first proposal was the extension of the county franchise to £10 householders. But it also proposed that persons possessing a £40 freehold in a borough should in future have a vote in the borough in which their property was situated, and not in the county. The bill also conferred the franchise on holders of a certain amount of stock, on depositors in savings banks, on graduates of universities, and on other persons qualified by position or education. The defect of the bill was that it did nothing to meet the only real need of reform—the enfranchisement of a certain proportion of the working classes. On the contrary, in this respect it perpetuated the settlement of 1832. The £10 household was still to furnish the bulk of the electorate, and the ordinary working man could not afford to pay £10 a year for his house. While the larger proposals of the bill were thus open to grave objection, its subsidiary features provoked ridicule. The suggestions that votes should be conferred on graduates and stockholders were laughed at as "fancy franchises." The bill, moreover, was not brought forward with the authority of a united cabinet. Two members of the government—Spencer Walpole and Henley—declined to be responsible for its provisions, and placed their resignations in Lord Derby's hands. In Walpole's judgment the bill was objectionable because it afforded no reasonable basis for a stable settlement. There was nothing in a £10 franchise which was capable of permanent defence, and if it was at once applied to counties as well as boroughs it would sooner or later be certain to be extended. He himself advocated with some force that it would be wiser and more popular to fix the county franchise at £20 and the borough franchise at £6 rateable value; and he contended that such a settlement could be defended on the old principle that taxation and representation should go together, for £20 was the minimum rent at which the house tax commenced, and a rateable value of £6 was the point at which the householder could not be described as a burgess. Weakened by the defection of two of its more important members, the government had little chance of obtaining the acceptance of its scheme. An amendment by Lord John Russell, condemning its main provisions, was adopted in an unusually full house by a substantial majority, and the cabinet had no alternative but to resign or dissolve. It chose the latter course. The general election, which almost immediately took place, increased to some extent the strength of the Conservative party. For the first time since their secession from Sir Robert Peel the Conservatives commanded more than three hundred votes in the House of Commons, but this increased strength was not sufficient to ensure them a majority. When the new parliament assembled, Lord Harington, the eldest son of the duke of Devonshire, was put forward to propose a direct vote of want of confidence in the administration. It was carried by 333 votes to 310, and the second Derby administration came to an end.

It was plain that the House of Commons had withdrawn its support from Lord Derby, but it was not clear that any other leading politician would be able to form a government. The jealousies between Lord John Russell and Lord Palmerston still existed; the more extreme men, who were identified with the policy of Cobden and Bright, had little confidence in either of these statesmen; and it was still uncertain whether the able group who had been the friends of Sir Robert Peel would finally gravitate to the Conservative or to the Liberal camp. The question, on the advice of Lord Derby,
endeavoured to solve the first of these difficulties by sending for Lord Granville, who led the Liberal party in the Lords, and authorizing him to form a government which should combine, as far as possible, all the more prominent Liberals. The attempt, however, failed, and the queen thereupon fell back upon Lord Palmerston. Lord John Russell agreed to accept office as foreign minister; Gladstone consented to take the chancellorship of the exchequer. Cobden was offered, but declined, the presidency of the Board of Trade; and the post which he refused was conferred on a prominent free trader, who had associated himself with Cobden's fortunes, but who, in the meantime, Palmerston had succeeded in combining in one ministry the various representatives of political progress. He had secured the support of the Peelites, who had left him after the fall of Lord Aberdeen in 1835, and of the free traders, who had done so much to defeat him in 1857 and 1858. His new administration was accordingly based on a broader bottom, and contained greater elements of strength than his former cabinet. And the country was requiring more stable government. The first three ministries of the queen had endured from the spring of 1835 to the spring of 1852, or for very nearly seventeen years; but the next seven years had seen the formation and dissolution of no less than four cabinets. It was felt that these frequent changes were unfortunate for the country, and every one was glad to welcome the advent of a government which seemed to promise greater permanence. That promise was fulfilled. The administration which Lord Palmerston succeeded in forming in 1859 endured for nearly a decade. It was characteristic of the early 1860s, and with slight modifications it continued into the early 1870s. It was, under its second chief Lord John (afterwards Earl) Russell, till the summer of 1866. It had thus a longer life than any cabinet which had governed England since the first Reform Act. But it owed its lasting character to the benevolence of its opponents rather than to the enthusiasm of its supporters. The Conservatives learned to regard the veteran statesman, who had combined all sections of Liberals under his banner, as the most powerful champion of Conservative principles; a virtual truce of parties was established during his continuance in office; and, for the most part of his ministry, a tacit understanding existed that the minister, on his side, should pursue a Conservative policy, and that the Conservatives, on theirs, should abstain from any real attempt to oust him from power. Lord John Russell, indeed, was too earnest in his desire for reform to abstain from one serious effort to accomplish it. Early in 1856 he proposed, with the sanction of the cabinet, a measure providing for the extension of the county franchise to 150,000 householders, of the borough franchise to 65 householders, and for a moderate redistribution of seats. But the country, being in enjoyment of considerable prosperity, paid only a languid attention to the scheme; its indifference was reflected in the House; the Conservatives were encouraged in their opposition by the lack of interest which the new bill excited, and the almost unconcealed dislike of the prime minister to its provisions. The bill, thus steadfastly opposed and half-heartedly supported, made only slow progress; and at last it was withdrawn by its author. He did not again attempt during Lord Palmerston's life to reintroduce the subject. Absorbed in the work of the foreign office, which at this time was abnormally active, he refrained from pressing home the arguments for internal reform.

In one important department, however, the ministry departed from the Conservative policy it pursued in other matters. Gladstone signalized his return to the exchequer by introducing a fortnightly budget, which he increased by also increased by all the year round, and by the introduction of the full amount of duties on manufactured goods, and largely to reduce those on French wines. But Gladstone was not content with these great alterations, which involved a loss of nearly £2,000,000 to the exchequer; he voluntarily undertook to sacrifice another million on what he called a supplemental measure of customs reform. He proposed to repeal the duties on paper, by which means he hoped to increase the opportunities of providing cheap literature for the people. The budget of 1860 produced a protracted controversy. The French treaty excited more criticism than enthusiasm on both sides of the Channel. In France the manufacturers complained that they would be unable to stand against the competition of English manufactures; in England the whole country, though in many instances it was wasting her resources and risking her supremacy by giving the French increased facilities for taking her iron, coal and machinery, and that no adequate advantage could result from the greater consumption of cheap claret. But the criticism which the French treaty aroused was drowned in the clamour which was created by the proposed repeal of the paper duties. The manufacture of paper was declared to be a struggling industry, which would be destroyed by the withdrawal of protection. The dissemination of cheap literature and the multiplication of cheap newspapers could not compensate the nation for the ruin of an important trade. If money could be spared, moreover, for the remission of taxation, the paper duties were much more oppressive than on some other articles. The tax on tea, for example, which had been raised during the late war to no less than 1s. 5d. a lb, was much more onerous; and it would be far wiser—so it was contended—to reduce the duties on tea than to repeal the duties on paper. Notwithstanding the opposition which the Paper Duties Bill undoubtedly excited, the proposal was carried in the Commons; it was, however, thrown out in the Lords, and its rejection led to a crisis which seemed at one time to threaten the good relations between the two houses of parliament. It was argued that if the Lords had the right to reject a measure remitting existing duties, they had in effect the right of imposing taxation, since there was no practical difference between the adoption of a new tax and the continuance of an old one which the Commons had determined to repeal. Lord Palmerston, however, with some tact postponed the controversy for the time by obtaining the appointment of a committee to search for precedents; and, after the report of the committee, he moved a series of resolutions affirming the right of the Commons to grant aids and supplies as their exclusive privilege, stating that the occasional rejection of financial measures by the Lords had always been regarded by the House of Commons as a warning, but declaring that the Commons had the remedy in their own hands by so framing bills of supply as to secure their acceptance. In accordance with this suggestion the Commons in the following year again resolved to repeal the paper duties; but, instead of embodying their decision in a separate bill, they included it in the same measure which dealt with all the financial arrangements of the year, and thus threw on the Lords the responsibility of either accepting the proposal, or of paralysing the whole machinery of administration by depriving the crown of the supplies which were required for the public services. The Lords were not prepared to risk this result, and they accordingly accepted a reform which they could no longer resist, and the bill became law. In order to enable him to accomplish these great changes, Gladstone temporarily raised the income tax, which he found at 9d. in the £, to 10d. But the result of his reforms was so marked that he was speedily able to reduce it. The revenue increased by happy and unforseen, and the excise tax was gradually reduced till it stood at 4d. in the closing years of the administration. During the same period the duty on tea was reduced from 1s. 5d. to 6d. a lb; and the national debt was diminished from rather more than £800,000,000 to rather less than £780,000,000, the charge for the debt declining, mainly through the falling in of the long annuities, by some £5,500,000 a year. With the possible exception of Sir Robert Peel's term of office, no previous period of British history has seen so many of the most remarkable financial reforms. Their success redeemed the character of the administration. The
Liberals, who complained that their leaders were pursuing a Conservative policy, could at least console themselves by the reflection that the chancellor of the exchequer was introducing satisfactory budgets. The language, moreover, which Gladstone was holding on other subjects encouraged the more advanced Liberals to expect that he would ultimately place himself at the head of the party of progress. This expectation was the more remarkable because Gladstone was the representative in the cabinet of the old Conservative party which Sir Robert Peel had led to victory. As lately as 1858 Peel had refused to resign in order to avoid a contest for Lord Derby; he was still a member of the Carlton Club; he sat for the university of Oxford; and on many questions he displayed a constant sympathy with Conservative traditions. Yet, on all the chief domestic questions which came before parliament in Lord Palmerston's second administration, Gladstone almost invariably took a more Liberal view than his chief. It was understood, indeed, that the relations between the two men were not always harmonious; that Lord Palmerston disapproved the resolute conduct of Gladstone, and that Gladstone deplored the Conservative tendencies of Lord Palmerston. It was believed that Gladstone on more than one occasion desired to escape from a position which he disliked by resigning office, and that the resignation was only averted through a consciousness that the ministry could not afford to lose its most eloquent member.

While on domestic matters, other than those affecting finance, the work of the ministry was pursuing a Conservative policy, its members were actively engaged on, and the attention of the public was keenly directed to, affairs abroad. For the period was one of foreign unrest, and the wars which were then waged have left an enduring mark on the map of the world, and have affected the position of the Anglo-Saxon race for all time. In the far East, the operations which it had been decided to undertake in China were necessarily postponed on account of the diversion of the forces, intended to exact revenge at Peking, to the suppression of mutiny in India. It was only late in 1858 that Lord Elgin and Baron Gros, the French plenipotentiary (for France joined England in securing simultaneous redress of grievances of her own), were enabled to obtain suitable rapprochement. It was arranged that the treaty, which was then provisionally concluded at Tientsin, should be ratified at Peking in the following year; and in June 1859 Mr (afterwards Sir Frederick) Bruce, Lord Elgin's brother, who had been plenipotentiary in India, proceeded to the Peiho with the object of securing its ratification. The allied squadron, however, was stopped by the forts at the mouth of the Peiho, which fired on the vessels; a landing party, which was disembarked to storm the forts, met with a disastrous check, and the squadron had to retire with an acknowledged loss of three gunboats and 400 men. This reverse necessitated fresh operations, and in 1860 Lord Elgin and Baron Gros were directed to return to China, and, at the head of an adequate force, were instructed to exact an apology for the attack on the allied fleets, the ratification and execution of the treaty of Tientsin, and the payment of an indemnity for the expenses of the war. The weakness of the Chinese empire was not appreciated at that time; the unfortunate incident on the Peiho in the previous summer had created an exaggerated impression of the strength of the Chinese arms, and some natural anxiety was felt for the success of the expedition. But the allied armies met with no serious resistance. The Chinese, indeed, endeavoured to delay their progress by negotiation rather than by force; and they succeeded in treacherously arresting some distinguished persons who had been sent into the Chinese lines to negotiate. But by the middle of October the Chinese army was decisively defeated; Peking was occupied; those British and French prisoners who had not succumbed to the hardships of their confinement were liberated. Lord Elgin determined on teaching the rulers of China a lesson by the destruction of the summer palace at Pekin. The plan was approved and the prince was compelled to submit to the terms of the Allies, and to ratify the treaty of Tientsin. There is no doubt that these operations helped to open the Chinese markets to British trade; but incidentally, by regulating the emigration of Chinese coolies, they had the unforeseen effect of exposing the industrial markets of the world to the serious competition of "cheap yellow" labour. A distinguished foreign statesman observed that Lord Palmerston had made a mistake. He thought that he had opened China to Europe; instead, he had let out the Chinese. It was perhaps a happier result of the war that it tended to the continuance of the Anglo-French alliance. French and British troops had again co-operated in a joint enterprise, and had shared the dangers and successes of a campaign. The war was not confined to China. In the beginning of 1859 diplomats were alarmed at the language addressed by the emperor of the French to the Austrian ambassador at Paris, which seemed to breathe the menace of a rupture. Notwithstanding the exertions which Great Britain made to avert hostilities, the provocation of Count Cavour induced Austria to declare war against Piedmont, and Napoleon thereupon moved to the support of his ally, promising to free Italy from the Alps to the Adriatic. As a matter of fact, the attitude of northern Germany, which was massing troops on the Rhine, and the defenceless condition of France, which was drained of soldiers for the Italian campaign, induced the emperor to halt before he had carried out his purpose, and terms of peace were hastily concerted at Villafranca, and were afterwards confirmed at Zurich, by which Lombardy was given to Piedmont, while Austria was left in possession of parts of the Quadrilater of Italy. The Austrian empire was restored to its former rulers. The refusal of the Italians to take back the Austrian grand dukes made the execution of these arrangements impracticable. Napoleon, indeed, used his influence to carry them into effect; but Lord John Russell, who was now in charge of the British foreign office, and who had Lord Palmerston and Gladstone on his side in the cabinet, gave a vigorous support to the claim of the Italians that their country should be able to regulate her own affairs. The French emperor had ultimately to yield to the determination of the inhabitants of central Italy, when it was backed by the arguments of the British foreign office, and Tuscany, Modena, Parma, as well as a portion of the states of the Church, were united to Piedmont. There was no doubt that through the whole of the negotiations the Italians were largely indebted to the labours of Lord John Russell. They recognized that they owed more to the moral support of England than to the armed assistance of France. The French emperor, moreover, took a step which lost him the sympathy of many Italians. Before the war he had arranged with Count Cavour that France should receive, as the price of her aid, the duchy of Savoy and the county of Nice. After Villafranca, the emperor, frankly recognizing that he had only half kept his promise, consented to waive his claim to these provinces. But, when he found himself unable to resist the annexation of central Italy to Piedmont, he reverted to the old arrangement. The formation of a strong Piedmontese kingdom, with the spoliation of the papal dominion, was unpopular in France; and he thought—perhaps naturally—that he must have something to show his people in return for sacrifices which had cost him the lives of 50,000 French soldiers, and concessions which the whole Catholic party in France resented. Count Cavour consented to pay the price which Napoleon thus exacted, and the frontier of France was accordingly extended to the Alps. But it is very doubtful whether Napoleon did not lose more than he gained by this addition to his territory. It certainly cost him the active friendship of Great Britain. The Anglo-French alliance had been already strained by the language of the French colonels in 1858 and the Franco-Austrian War of 1859; it never fully recovered from the shock which it received by the evidence, which the annexation of Savoy and Nice gave, of the ambition of the French emperor. The British people gave way to what Cobden called the last of the three panic. Lord Palmerston was not averse to the Chinese expeditions as a large return of money for the fortification of the coasts; and the volunteer movement, which had its origin in 1859, received a remarkable stimulus in 1860. In this year the course of events in Italy
emphasized the differences between the policy of Great Britain and that of France. Garibaldi, with a thousand followers, made his famous descent on the coast of Sicily. After making himself master of that island, he crossed over to the mainland, drove the king of Naples out of his capital, and forced him to take refuge in Gaeta. In France these events were regarded with dismay. The emperor wished to stop Garibaldi’s passage across the strait, and stationed his fleet at Gaeta to protect the king of Naples. Lord John Russell, on the contrary, welcomed Garibaldi’s success with enthusiasm. He declined to intervene in the affairs of Italy by confining the great liberator to Sicily; he protested against the presence of the French fleet at Gaeta; and when other foreign nations denounced the conduct of Piedmont, he defended it by quoting Vattel and citing the example of William III. When, finally, Italian troops entered the dominions of the pope, France withdrew her ambassador from the court of Turin, and England under Lord John Russell’s advice at once recognized the new kingdom of Italy.

In these great events—for the union of Italy was the greatest fact which had been accomplished in Europe since the fall of the first Napoleon—the British ministry had undoubtedly acquired credit. It was everywhere felt that the new kingdom owed much to the moral support which had been steadily and consistently given to it by Great Britain. Soon afterwards, however, in the autumn of 1863, the death of the king of Denmark led to a revolution in the north of Europe, in which Palmerston’s government displayed less resolution, and lost much of the prestige which it had acquired by its Italian policy. The duchies of Schleswig and Holstein had been for centuries united to the kingdom of Denmark by the golden link of the crown; in other respects they had been organically kept distinct, while one of them—Holstein—was a member of the German confederation. The succession to the crown of Denmark, however, was different from that in the duchies. In Denmark the crown could descend, as it descends in Great Britain, through females. In the duchies the descent was confined to the male line; and, as Frederick VII., who ascended the Danish throne in 1848, had no direct issue, the next heir to the crown of Denmark under this rule was Prince Christian of Glücksburg, afterwards king; the next heir to the duchies being the duke of Augustenburg. In 1850 an arrangement had been made to prevent the separation of the duchies from the crown. As a result of a conference held in London, the duke of Augustenburg was induced to renounce his claim on the receipt of a large sum of money. Most of the great powers of Europe were parties to this plan. But the German confederation was not represented at the conference, and was not therefore committed to its conclusions. During the reign of Frederick VII. the Danish government endeavoured to cement the alliance between the duchies and the kingdom, and especially to separate the interests of Schleswig, which was largely Danish in its sympathies, from those of Holstein, which was almost exclusively German. With this object, in the last year of his life, Frederick VII. granted Holstein autonomous institutions, and bound Schleswig more closely to the Danish monarchy. The new king Christian IX. confirmed this arrangement. The German diet at Frankfort at once protested against it. Following up words with acts, it decided on occupying Holstein, and it delegated the duty of carrying out its order to Hanover and Saxony. While this federal execution was taking place, the duke of Augustenburg—regardless of the arrangements to which he had consented—delegated his rights in the duchies to his son, who formally claimed the succession. So far the situation, which was serious enough, had been largely dependent on the action of Germany. In the closing days of 1863 it passed mainly into the control of the two chief German powers. In Prussia Bismarck had lately become prime minister, and was animated by ambitious projects for his country’s aggrandizement. Austria, afraid of losing her influence in Germany, followed the lead of Prussia, and the two powers required Denmark to cancel the arrangements which Frederick VII. had made, and which Christian IX. had confirmed, threatening in case of refusal to follow up the occupa-

tion of Holstein by that of Schleswig. As the Danes gave only a provisional assent to the demand, Prussian and Austrian troops entered Schleswig. These events created much excitement in England. The great majority of the British people, who imperfectly understood the merits of the case, were unanimous in their desire to support Denmark by arms. Their wish had been accentuated by the circumstance that the marriage in the previous spring of the prince of Wales to the daughter of the new king of Denmark had given them an almost personal interest in the struggle. Lord Palmerston had publicly expressed the views of the people by declaring that, if Denmark were attacked, her assailants would not have to deal with Denmark alone. The language of the public press and of Englishmen visiting Denmark confirmed the impression which the words of the prime minister had produced; and there is unfortunately no doubt that Denmark was encouraged to resist her powerful opponents by the belief, which she was thus almost authorized in entertaining, that she could reckon in the hour of her danger on the active assistance of the United Kingdom. If Lord Palmerston had been supported by his cabinet, or if he had been a younger man, he might possibly, in 1864, have made good the words which he had rashly uttered in 1863. But the queen, who, it is fair to add, understood the movement which was tending to German unity much better than most of her advisers, was averse from war. A large section of the cabinet shared the queen’s hesitation, and Lord Palmerston—with the weight of nearly eighty summers upon him—was not strong enough to enforce his will against both his sovereign and his colleagues. He made some attempt to ascertain whether the emperor of the French would support him if he went to war. But he found that the emperor had not much fancy for a struggle which would have restored Holstein to Denmark; and that, if he went to war at all, his chief object would be the liberation of Venice and the rectification of his own frontier. Even Lord Palmerston shrank from entering on a campaign which would have involved all Europe in confiscation and would have unsettled the boundaries of most continental nations; and the British government endeavoured thenceforward to stop hostilities by referring the question immediately in dispute to a conference in London. The labours of the conference proved abortive. Its members were unable to agree upon any methods of settlements, and the war went on. Denmark, naturally unable to grapple with her powerful antagonists, was forced to yield, and the two duchies which were the subject of dispute were taken from her.

The full consequences of this struggle were not visible at the time. It was impossible to foresee that it was the first step which was to carry Prussia forward, under her ambitious minister, to a position of acknowledged supremacy on the continent. But the results to Great Britain were plain enough. She had been mighty in words and weak in deeds. It was no doubt open to her to contend, as perhaps more wise people consider, that the cause of Denmark was not of sufficient importance to justify her in going to war. But it was not open to her to encourage a weak power to resist and then desert her in the hour of her necessity. Lord Palmerston should not have used the language which he employed in 1864 if he had not decided that his brave words would be followed by brave action. His conduct lowered the prestige of Great Britain at least as much as his Italian policy had raised it. Continental statesmen thenceforward assumed that Great Britain, however much she might protest, would not resort to arms, and the influence of England suffered, as it was bound to suffer, in consequence.

Meanwhile, in this period of warfare, another struggle was being fought out on a still greater scale in North America. The election of Abraham Lincoln to the presidency of the United States emphasized the fact that the majority of the inhabitants of the Northern States were opposed to the further spread of slavery in the states. In the beginning of 1861, several of the Southern States formally seceded from the union. A steamer sent by the Federal government with reinforcements to Fort Sumter was fired upon, and both parties made preparations for the civil war which was apparently inevitable. On
the one side the Confederate States—as the seceding states were called—were animed by a resolution to protect their property. On the other side the "conscience" of the North was excited by a passionate desire to wipe out the blot of slavery. Thus both parties were affected by some of the most powerful considerations which can influence mankind, while the North were further actuated by the natural and just sentiments of the South, which was threatened with disruption. The progress of the great struggle was watched with painful attention in England. The most important manufacturing interest in England was paralysed by the loss of the raw cotton, which was obtained almost exclusively from the United States, and tens of thousands of workpeople were thrown out of employment. The distress which resulted naturally created a strong feeling in favour of intervention, which might terminate the war and open the Southern ports to British commerce; and the initial successes which the Confederates secured seemed to afford some justification for such a proceeding. In the course of 1862 indeed, when the Confederate armies had secured many victories, Gladstone, speaking at Newcastle, used the famous expression that President Jefferson Davis had "made a nation"; and Lord Palmerston's language in the House of Commons—while opposing a motion for the recognition of the South—implied the impression that his Government thought as Mr Gladstone did.

The emperor Napoleon, in July of the same year, confidentially asked the British minister whether the moment had not come for recognizing the South; and in the following September Lord Palmerston was himself disposed in concert with France to offer to mediate on the basis of separation. Soon afterwards, however, the growing exhaustion of the South improved the prospects of the Northern States: an increasing number of persons in Great Britain objected to interfere in the interests of slavery; and the combatants were allowed to fight out their quarrel without the interference of Europe.

At the beginning of the war, Lord John Russell (who was made a peer as Earl Russell in 1861) acknowledged the Southern States as belligerents. His decision caused some ill-feeling at Washington; but it was inevitable. For the North had proclaimed a blockade of the Southern ports; and it would have been both inconvenient and unfair if Lord Russell had decided to recognize the blockade and had refused to acknowledge the belligerent rights of the Southern States. Lord Russell's decision, however, seemed to indicate some latent sympathy for the Southern cause; and the irritation which was felt in the North was increased by the news that the Southern States were accrediting two gentlemen to represent them at Paris and at London. These emissaries, Messrs Mason and Slidell, succeeded in running the blockade and in reaching Charleston, where they embarked on the "Alabama," a British mail steamer sailing for England. On her passage home the "Trent" was stopped by the Federal steamer "San Jacinto"; she was boarded, and Messrs Mason and Slidell were arrested. There was no doubt that the captain of the "San Jacinto" had acted irregularly. While he had the right to stop the "Trent," examine the mails, and, if he found despatches for the enemy among them, carry the vessel into an American port for adjudication, he had no authority to board the vessel and take two of her passengers. "The British government," to use its own language, "could not allow such an affront to the national honour to pass without due reparation." They decided on sending what practically amounted to an ultimatum to the Federal government, calling upon it to liberate the prisoners and to make a suitable apology. The presentation of this ultimatum, which was accompanied by the despatch of troops to Canada, was very nearly provoking war with the United States. The British thought it was done in the same direction as the Gladstone's policy.

by the prince consort before his fatal illness. He died before the answer to the despatch was received; and his death deprived the queen of an adviser who had stood by her side since the earlier days of her reign, and who, by his prudence and conduct, had done much to raise the tone of the court and the influence of the crown. Happily for the future of the world, the governor of the United States of North America felt himself able to accept the proposals which had been thus addressed to it, and to give the reparation which was demanded; and the danger of war between the two great branches of the Anglo-Saxon race was averted. But, in the following summer, a new event excited fresh animosities, and aroused a controversy which endured for the best part of ten years.

The Confederates, naturally anxious to harass the commerce of their enemies, endeavoured from the commencement of the war to purchase armed cruisers from builders of neutral nations. In June 1862 the American minister in London drew Lord Russell's attention to the fact that a vessel, lately launched at Messrs Laird's yard at Birkenhead, was obviously intended to be employed as a Confederate cruiser. The solicitor to the commissioners of customs, however, considered that no facts had been revealed to authorize the detention of the vessel, and this opinion was reported in July to the American minister, Charles Francis Adams. He therefore suggested that the vessel should be detained for additional facts, and at the same time furnished them with the opinion of an eminent English lawyer, R. P. Collier (afterwards Lord Monkswell), to the effect that "it would be difficult to make out a stronger case of infringement of the Foreign Enlistment Act, which if not enforced on this occasion is little better than a dead letter."

These facts and this opinion were at once sent to the law officers. They reached the queen's advocate on Saturday the 26th of July; but, by an unfortunate mischance, the queen's advocate had just been wholly incapacitated by a distressing illness; and the papers, in consequence, did not reach the attorney- and solicitor-general till the evening of the following Monday, when they at once advised the government to detain the vessel. Lord Russell thereupon sent orders to Liverpool for her detention. In the meanwhile the vessel—probably aware of the necessity for haste—had put to sea, and had commenced the career which made her famous as the "Alabama." Ministers might even then have taken steps to stop the vessel by directing her detention in any British port to which she resorted for supplies. The cabinet, however, shrank from this course. The "Alabama" was allowed to prey on Federal commerce, and undoubtedly inflicted a vast amount of injury on the trade of the United States. In the autumn of 1865 Adams demanded reparation for the injuries which had thus been sustained, and this demand was repeated for many years. At length, after Lord Palmerston's death and Lord Russell's retirement, a joint commission was appointed to examine into the many cases of dispute which had arisen between the United States and Great Britain. The commissioners agreed upon three rules by which they thought neutrals should in future be bound, and recommended that they should be given a retrospective effect. They decided also that the claims which had arisen out of the depredations of the "Alabama" should be referred to arbitration. In the course of 1872 the arbitrators met at Geneva. Their finding was adverse to Great Britain, which was condemned to pay a large sum of money—more than £3,000,000—as compensation. A period of exceptional prosperity, which largely increased the revenue, enabled a chancellor of the exchequer to boast that the country had drunk itself out of the "Alabama" difficulty.

In October 1865 Lord Palmerston's rule, which had been characterized by six years of political inaction at home and by constant disturbance abroad, was terminated by his death. The ministry, which had suffered many losses from death during its duration, was temporarily reconstructed under Lord Russell; and the new minister at once decided to put an end to the period of internal stagnation, which had lasted so long, by the introduction of a
new Reform Bill. Accordingly, in March 1868 Gladstone, who now led the House of Commons, introduced a measure which proposed to extend the county franchise to £4 and the borough franchise to £2 householders. The bill did not create much enthusiasm among Liberals, and it was naturally opposed by the Conservatives, who were reinforced by a large section of moderate Liberals, nicknamed in consequence of a phrase in one of his speeches, Adulterers of Reform. After an unsuccessful resolution in which the Commons showed little disposition to give the ministry any effective support, an amendment was carried by Lord Dunkellis, the eldest son of Lord Clancarlide, basing the borough franchise on rating instead of rental. The cabinet, recognizing from the division that the control of the House had passed out of its hands, resigned office, and the queen was compelled to entrust Lord Derby with the task of forming a new administration.

For the third time in his career Lord Derby undertook the formidable task of conducting the government of the country with only a minority of the House of Commons to support him. The moment at which he made this third attempt was one of unusual anxiety. Abroad, the almost simultaneous outbreak of war between Prussia and Austria was destined to affect the whole aspect of continental politics. At home, a terrible murrain had fallen on the cattle, inflicting ruin on the agriculture of the country; a grave commercial depression was creating alarm in the city of London, and, in its consequences, injuring the interests of labour; while the working classes, at last roused from their long indolence, and angry at the rejection of Lord Russell's bill, were assembling in their tens of thousands to demand reform. The cabinet determined to prohibit a meeting which the Reform League decided to hold in Hyde Park on the 23rd of July, and closed the gates of the park on the people. But the mob, converging on the park in thousands, surged round the railings, which, in a little inquiry might have shown were too weak to resist any real pressure. Either accidentally or intentionally, the railings were overturned in one place, and the people, perceiving their opportunity, at once threw them down round the whole circuit of the park. Few acts in Queen Victoria's reign were attended with greater consequences. For the riot in Hyde Park led almost directly to a new Reform Act, and to the transfer of power from the middle classes to the masses of the people.

Yet though the new government found it necessary to introduce a Reform Bill, a wide difference of opinion existed in the cabinet as to the form which the measure should take. Several of its members were in favour of assimilating the borough franchise to that in force in municipal elections, and practically conferring a vote on every householder who had three years' residence in the constituency. General Peel, however—Sir Robert Peel's brother—who held the seals of the war office, objected to this extension; and the cabinet ultimately decided on evading the difficulty by bringing forward a series of resolutions on which a scheme of reform might ultimately be based. Their success in 1858, in dealing with the question of the government of India in this way, commended the decision to the acceptance of the cabinet. But it was soon apparent that the House of Commons required a definite scheme, and that it would not seriously consider a set of abstract resolutions which committed no one to any distinct plan. Hence on the 23rd of February the cabinet decided on withdrawing its resolutions and reverting to its original bill. On the following day Lord Cranborne—better known afterwards as Lord Salisbury—discovered that the bill had more democratic tendencies than he had originally supposed, and refused to be a party to it. On Monday, the 25th, the cabinet again met to consider the new difficulty which had thus arisen; and it decided (as was said afterwards by Sir John Pakington) in ten minutes to substitute for the scheme a mild measure extending the borough franchise to houses rated at £6 a year, and conferring the county franchise on £20 householders. The bill, it was soon obvious, would be acceptable to no one; and the government again fell back on its original proposal. Three members of the cabinet, however, Lord Cranborne, Lord Carnarvon and General Peel, refused to be parties to the measure, and resigned office, the government being necessarily weakened by these defections. In the large scheme which the cabinet had now adopted, the borough franchise was conferred on all householders rated to the relief of the poor, who had for two years occupied the houses which gave them the qualification; the county franchise was given to the occupiers of houses rated at £6 a year. After a debate, it was proposed that these extensions should be accompanied by an extension of the electoral franchise, and a franchise conferred on persons who had paid twenty shillings in assessed taxes or income tax; the tax-payers who had gained a vote in this way being given a second vote in respect of the property which they occupied. In the course of the discussion on the bill in the House of Commons, the securities on which its authors had relied to enable them to stem the tide of democracy were, chiefly through Gladstone's exertions, swept away. The dual vote was abolished, direct payment of rates was surrendered, the county franchise was extended to £2 householders, and the redistribution of seats was largely increased. The bill, in the shape in which it had been introduced, had been surrounded with safeguards to property. With their loss it involved a great radical change, which placed the working classes of the country in the position of predominance which the middle classes had occupied since 1832.

The passage of the bill created a crisis of the constitution of parliament; but had to be postponed to enable parliament to supplement the English Reform Act of 1867 with measures applicable to Scotland and Ireland, and to give time for settling the boundaries of the new constituencies which had been created. This delay gave the Conservatives another year of office. But the first place in the cabinet passed in 1868 from Lord Derby to his lieutenant, Disraeli. The change added interest to political life. Thenceforward, for the next thirteen years, the chief places in the two great parties in the state were filled by the two men, Gladstone and Disraeli, who were unquestionably the ablest representatives of their respective followers. But the situation was also remarkable because power thus definitely passed from men who, without exception, had been born in the 18th century, and had held cabinet offices before 1832, to men who had been born in the 19th century, and had only risen to cabinet rank in the forties and the fifties. It was also interesting to reflect that Gladstone had begun life as a Conservative, and had only gradually moved to the ranks of the Liberal party; while Disraeli had fought his first election under the auspices of O'Connell and Hume, had won his spurs by his attacks on Sir Robert Peel, and had been only reluctantly adopted by the Conservatives as their leader in the House of Commons. The struggle commenced in 1868 on an Irish question. During the previous years considerable attention had been paid to a secret conspiracy in Ireland and among the Irish in America. The Fenians, as they were called, actually attempted insurrection in Ireland, and an invasion of Canada from the United States. At the beginning of 1866 Lord Russell's government thought itself compelled to suspend the Habeas Corpus Act in Ireland; and in 1867 Lord Derby's government was confronted in the spring by a plot to seize Chester Castle, and in the autumn by an attack on a prison van at Manchester containing Fenian prisoners, and by an atrocity attempt to blow up Clerkenwell gaol. The administration, in other words, faced the necessity of applying firm government to Ireland. Liberal statesmen, on the contrary, desired to extirpate rebellion by remedying the grievances of which Ireland still complained. Chief among these was the fact that the Established Church in Ireland was the church of only a minority of the people. In March 1868 John Francis Maguire, an Irish Catholic, asked the House of Commons to resolve itself into a committee to take into immediate consideration the affairs of Ireland. Gladstone, in the course of the debate, declared that in his opinion the time had come when the Irish Church, as a political institution, should cease; and he followed up his declaration by a series of resolutions, which
were accepted by considerable majorities, pledges the House to its disestablishment. Disraeli, recognizing the full significance of this decision, announced that, as soon as the necessary preparations could be made, the government would appeal from the House to the country. Parliament was dissolved at the end of July, but the general election did not take place till the end of the following November. The future of the Irish Church naturally formed one of the chief subjects which occupied the attention of the electors, but the issue was largely determined by wider considerations. The country, after the long political truce which had been maintained by Lord Palmerston, was again ranged in two hostile camps, animated by opposing views. It was virtually asked to decide in 1868 whether it would put its trust in Liberal or Conservative, in Gladstone or Disraeli. By an overwhelming majority it threw its lot in favour of Gladstone; and Disraeli, without even venturing to meet parliament, took the unusual course of at once placing his resignation in the queen's hands.

The Conservative government, which thus fell, will be chiefly recollected for its remarkable concession to democratic principles by the passage of the Reform Act of 1867; but it deserves perhaps a word of praise for its conduct of a distant and unusual war. The emperor of Abyssinia had, for some time, detained some Englishmen prisoners in his country; and the government, unable to obtain redress in other ways, decided on sending an army to release them. The expedition, entrusted to Sir Robert Napier, afterwards Lord Napier of Magdala, was fitted out at great expense, and was rewarded with complete success. The prisoners were released, and the Abyssinian monarch committed suicide. Disraeli—whose oriental imagination was excited by the triumph—incurred some ridicule by his bombastic declaration that "the standard of St George was hoisted upon the mountains of Rasselas." But the ministry could at least claim that the war had been waged to rescue Englishmen from captivity, that it had been conducted with skill, and that it had accomplished its object. The events of the Abyssinian war, however, were forgotten in the great political revolution which had swept the Conservatives from office and placed Gladstone in power. His government was destined to endure for more than five years. During that period it experienced the alternate prosperity and decline which nearly forty years before had been the lot of the Whigs after the passage of the first Reform Act. During its first two sessions it accomplished greater changes in legislation than had been attempted by any ministry since that of Lord Grey. In its third last sessions it was destined to sink into gradual disrepute; and it was ultimately swept away by a wave of popular reaction, as remarkable as that which had borne it into office.

It was generally understood that Gladstone intended to deal with three great Irish grievances—the three branches of the upas tree—the religious, agricultural and educational grievances. The session of 1869 was devoted to the first of these subjects. Gladstone introduced a bill disconnecting the Irish Church from the state, establishing a synod for its government, and—after leaving it in possession of its churches and its parsonages—giving a provision for the life-interest of its existing clergy—devoting the bulk of its property to the relief of distress in Ireland. The bill was carried by large majorities through the House of Commons; and the feeling of the country was so strong that the Lords did not venture on its rejection. They satisfied themselves with engrafting on it a series of amendments which, on the whole, secured rather more liberal terms of compensation for existing interests. Some of these amendments were perhaps adopted by Gladstone reluctantly, and made amends in respect of the others; and the bill, which had practically occupied the whole session, and had perhaps involved higher constructive skill than any measure passed in the previous half-century, became law. Having dealt with the Irish Church in 1869, Gladstone turned to the more complicated question of Irish land. So far back as the forties Sir R. Peel had appointed a commission, known from its chairman as the Devon commission, which had recommended that the Irish tenant, in the event of disturbance, should receive some compensation for certain specified improvements which he had made in his holding. Parliament neglected to give effect to these recommendations; in a country where agriculture was the chief or almost only occupation, the tenant remained at his landlord's mercy. In 1870 Gladstone proposed to give the tenant a personal interest in improvements, suitable to the holding which he had made either before or after the passing of the act. He proposed also that, in cases of eviction, the smaller tenancy should receive compensation for disturbance. The larger tenantry, who were supposed to be able to look after their own interests, were entirely debarrd, and tenants enjoying leases were excluded from claiming compensation, except for tillages, buildings and reclamation of lands. A special court, it was further provided, should be instituted to carry out the provisions of the bill. Large and radical as the measure was, reversing many of the accepted principles of legislation by giving the tenant a quasi-partnership with the landlord in his holding, no serious opposition was made to it in either House of Parliament. Its details, indeed, were abundantly criticized, but its principles were hardly disputed, and it became law without any substantial alteration of its original provisions. In two sessions two branches of the bill were passed. The measure was not completed in 1870 was not solely occupied with the wrongs of Irish tenantry. In the same year Forster, as vice-president of the council, succeeded in carrying the great measure which for the first time made education compulsory. In devising his scheme, Forster endeavoured to utilize, as far as possible, the educational machinery which had been voluntarily provided by various religious organizations. He gave the institutions, which had been thus established, the full benefit of the assistance which the government was prepared to afford to board schools, on their adopting a conscience clause under which the religious susceptibilities of the parents of children were protected. This provision led to many debates, and produced the first symptoms of disruption in the Liberal party. The Nonconformists contended that no such aid should be given to any school which was not conducted on undenominational principles. Supported by the bulk of the Conservative party, Forster was enabled to defeat the dissenters. But the victory which he secured was, in one sense, dearly purchased. The first breach in the Liberal ranks had been made; and the government, after 1870, never again commanded the same united support which had enabled it to pursue its victorious career in the first two sessions of its existence.

Towards the close of the session of 1870 other events, for which the government had direct responsibility, introduced new difficulties. War unexpectedly broke out between France and Prussia. The French empire fell; the Black Sea neutrality.

Elementary education.
ENGLISH HISTORY

appreciate the wisdom of a concession which has gained for them the friendship of the United States. But in 1871 the country resented the manner in which Lord Granville had acted. Whatever credit the government might have derived from its domestic measures, it was discredited, or it was thought to be, by its foreign policy. In these circumstances legislation in 1871 was not marked with the success which had attended the government in previous sessions. The government succeeded in terminating a long controversy by abolishing ecclesiastical tests at universities. But the Lords ventured to reject a measure for the introduction of the ballot at elections, and refused to proceed with a bill for the abolition of purchase in the army. The result of these decisions was indeed remarkable. In the one case, the Lords in 1872 found it necessary to give way, and to pass the Ballot Bill, which they had rejected in 1871. In the other, Gladstone decided on abolishing, by the direct authority of the crown, the system which the Lords refused to do away with by legislation. But his high-handed proceeding, though it forced the Lords to reconsider their decision, strained the allegiance of many of his supporters, and still further impaired the popularity of his administration. Most men felt that it would have been permissible for him, at the commencement of the session, to have used the queen's authority to terminate the purchase system; but they considered that, as he had not taken this course, it was not open to him to reverse the decision of the legislature by resorting to the prerogative. Two appointments, one to a judicial office, the other to an ecclesiastical preferment, in which Gladstone, about the same time, showed more disposition to obey the letter than the spirit of the law, confirmed the impression which the abolition of purchase had made. Great reformatory ministers would do well to recollect that the success of even liberal measures may be dearly purchased by the resort to what are regarded as unconstitutional expedients.

In the following years the embarrassments of the government were further increased. In 1872 Bruce, the home secretary, succeeded in passing a measure of licensing reform. But the abstainers condemned the bill as inadequate; the publicans denounced it as oppressive; and the whole strength of the licensed victuallers was thenceforward arrayed against the ministry. In 1873 Gladstone attempted to complete his great Irish measures by conferring on Ireland the advantage of a university which would be equally available to Protestants and Roman Catholics. But his proposal again failed to satisfy those in whose interests it was proposed. The second reading of the bill was rejected by a small majority, and Gladstone resigned; but, as Disraeli could not form a government, he resumed office. The power of the great minister was, however, spent; his ministry was hopelessly discredited. History, in fact, was repeating itself. The ministry was suffering, as Lord Grey's government had suffered nearly forty years before, from the effect of its own successes. It had accomplished more than any of its supporters had expected, but in doing so it had harassed many interests and excited much opposition. Gladstone endeavoured to meet the storm by a rearrangement of his crew. Bruce, who had offended the licensed victuallers, was removed from the home office, and made a peer and president of the council. Lowe, who had incurred unpopularity by his fiscal measures, and especially by an abortive suggestion for the taxation of matches, was transferred from the exchequer to the home office, and Gladstone himself assumed the duties of chancellor of the exchequer. He thereby created a difficulty for himself which he had not foreseen. Up to 1867 a minister leaving one office and accepting another vacated his seat; after 1867 a transfer from one post to another did not necessitate a fresh election. But Gladstone in 1873 had taken a course which had not been contemplated in 1867. He had not been transferred from one office to another. He had accepted a new in addition to his old office. It was, to say the least, uncertain whether his action in this respect had, or had not, vacated his seat. It would be unfair to suggest that the inconvenient difficulty with which he was thus confronted determined his policy, though he was probably insensibly influenced by it. However this may be, on the eve of the session of 1874 he suddenly decided to dissolve parliament and to appeal to the country. He announced his decision in an address to his constituents, in which, among other financial reforms, he promised to repeal the income tax. The course which Gladstone took, and the bait which he held out to the electors, were generally condemned. The country, weary of the ministry and of its measures, almost everywhere supported the Conservative candidates. Disraeli found himself restored to power at the head of an overwhelming majority, and the great minister who, five years before, had achieved so marked a triumph temporarily withdrew from the leadership of the party with whose aid he had accomplished such important results. His ministry had been essentially one of peace, yet its closing days were memorable for one little war in which a great soldier increased a reputation already high. Sir Garnet Wolseley triumphed over the difficulties which the climate of the west coast of Africa imposes on Europeans, and brought a troublesome contest with the Ashantis to a successful conclusion.

The history of Disraeli's second administration affords an exact reverse to that of Gladstone's first cabinet. In legislation the ministry attempted little and accomplished less. They did something to meet the wishes of the publicans, whose discontent had contributed largely to Gladstone's defeat, by amending some of the provisions of Bruce's licensing bill; they supported and succeeded in passing a measure, brought in by the prime minister, to restrain some of the irregularities which the Ritualists were introducing into public worship; and they were compelled by the violent insistence of Plimsoll to pass an act to protect the lives of merchant seamen. Disraeli's government, however, will be chiefly remembered for its foreign policy. Years before he had propounded in Pancreed the theory that England should aim at eastern empire. Circumstances in India and Egypt enabled him to translate his theory into practice. In 1875 the country was suddenly startled by the news that it had acquired a new position and assumed new responsibilities in Egypt by the purchase of the shares which the khedive of Egypt held in the Suez Canal. In the following spring a new surprise was afforded by the introduction of a measure authorizing the king to assume the title of emperor of India. But these significant actions were almost forgotten in the presence of a new crisis; for in 1876 misgovernment in Turkey had provoked a natural result, for Europe was more than a state of armed insurrection. In the presence of a grave danger, Count Andrassy, the Austrian minister, drew up a note which was afterwards known by his name, declaring that the Porte had failed to carry into effect the promises of reform which she had made, and that some combined action on the part of Europe was necessary to compel her to do so. The note was accepted by the three continental empires, but Great Britain refused in the first instance to assent to it, and only ultimately consented at the desire of the Porte, whose statesmen seem to have imagined that the nominal co-operation of England would have the effect of restraining the action of other powers. Turkey accepted the note and renewed the promises of reform, which she had so often made, and which meant so little. The three northern powers thereupon agreed upon what was known as the Berlin Memorandum, in which they demanded an armistice, and proposed to watch over the completion of the reforms which the Porte had promised. The British government refused to be a party to this memorandum, which in consequence became abortive. The insurrection increased in intensity. The sultan Abdul Aziz, thought unequal to the crisis, was hastily deposed; he was either murdered or led to commit suicide; and insurrection in Bulgaria was stamped out by massacre. The story of the "Bulgarian atrocities " was published in Great Britain in the summer of 1876. Disraeli characteristically dismissed it as "coffee-house babble," but official investigation proved the substantial accuracy of the reports which had reached England. The people regarded these events with horror. Gladstone, emerging from his retirement, denounced the conduct of the Bulgarians as "atrocious."
Turks. In a phrase which became famous he declared that the only remedy for the European provinces of the Porte was to turn out the Ottoman government "bag and baggage." All England was at once arrayed into two camps. One party was led by Disraeli, who was supposed to represent the traditional policy of England of maintaining the rule of the Turk at all hazards; the other, inspired by the example of Gladstone, was resolved at all costs to terminate oppression, but was at the same time distressed as indirectly assisting the ambitious views by which the Eastern policy of Russia had always been animadverted. The crisis soon became intense. In June, 1876, Servia and Montenegro declared war against Turkey. In a few months Servia was hopelessly beaten. Through the insistence of Russia an armistice was agreed upon; and Lord Beaconsfield—for Disraeli had now been raised to the peerage—endeavoured to utilize the breathing space by organizing a conference of the great powers at Constantinople, which was attended on behalf of Great Britain by Lord Salisbury. The Constantinople conference proved abortive, and in the beginning of 1877 Russia declared war. For some time, however, her success was hardly equal to her expectations. The Turks, entrenched at Plevna, delayed the Russian advance; and it was only towards the close of 1877 that Plevna at last fell and Turkish resistance collapsed. With its downfall the war party in England, which was led by the prime minister, increased in violence. From the refrain of a song, sung night after night at a London music hall, it was known as Jingoism. It had taken office to force the British fleet to pass the Dardanelles and go up to Constantinople; and though the order was subsequently withdrawn, it asked for and obtained a grant of £5,000,000 for naval and military purposes. When news came that the Russian armies had reached Adrianople, that they had concluded some arrangement with the Turks, and that they were pressing forward towards Constantinople, the fleet was again directed to pass the Dardanelles. Soon afterwards the government decided to call out the reserves and to bring a contingent of Indian troops to the Mediterranean. Lord Derby, who was at the foreign office, thereupon retired from the ministry, and was succeeded by Lord Salisbury. Lord Derby's resignation was everywhere regarded as a proof that Great Britain was on the verge of war. Happily this did not occur. At Prince Bismarck's suggestion Russia consented to refer the treaty which she had concluded at San Stefano to a congress of the great powers; and the congress, at which Great Britain was represented by Lord Beaconsfield and Lord Salisbury, succeeded in substituting for the treaty of San Stefano the treaty of Berlin. The one great advantage derived from it was the tacit acknowledgment by Russia that Europe could alone alter arrangements which Europe had made. In every other sense it is doubtful whether the provisions of the treaty of Berlin were more favourable than those of the treaty of San Stefano. On Lord Beaconsfield's return, however, he claimed for Lord Salisbury and himself that they had brought back "peace with honour," and the country accepted with wild delight the phrase, without taking much trouble to analyse its justice.

If Lord Beaconsfield had dissolved parliament immediately after his return from Berlin, it is possible that the wave of popularity which had been raised by his success would have borne him forward to a fresh victory in the constituencies. His omission to do so gave the country time to meditate on the consequences of his policy. One result soon became perceptible. Differences with Russia produced their inevitable consequences in fresh complications on the Indian frontier. The Russian government, confronted with a quarrel with Great Britain in eastern Europe, endeavoured to create difficulties in Afghanistan. A Russian envoy was sent to Kabul, where Shere Ali, who had succeeded his father Dost Mahommed in 1863, was in power; and the British government, alarmed at the approach of events on the Afghan frontier, took steps to send a mission to the Afghan capital. The mission was stopped on the frontier by an agent of Shere Ali, who declined to allow it to proceed. The British government refused to put up with an affront of this kind, and their envoy, supported by an armistice, continued his advance. Afghanistan was again invaded. Kabul and Kandahar were occupied; and Shere Ali was forced to fly, and soon afterwards died. His successor, Yakub Khan, came to the British camp and signed, in May 1879, the treaty of Gandamak. Under the terms of this treaty the Indian government undertook to pay the new amir a subsidy of £60,000 a year; and Yakub Khan consented to receive a British mission at Kabul, and to cede some territory in the Hindukush which the military advisers of Lord Beaconsfield considered necessary to make the frontier more "scientific." This apparent success was soon followed by disastrous news. The deplorable events of 1841 were re-enacted in 1879. The new envoy reached Kabul, but was soon afterwards murdered. A British army was again sent into Afghanistan, and Kabul was again occupied. Yakub Khan, who had been made amir in 1879, was deposed, and Abdur Rahman Khan was selected as his successor. The British did not assert their superiority without much fighting and some serious reverses. Their victory was at last assured by the excellent strategy of Sir Donald Stewart and Sir Frederick (afterwards Lord) Roberts. But before the final victory was gained Lord Beaconsfield had fallen. His policy had brought Great Britain to the verge of disaster in Afghanistan: the credit of reasserting the superiority of British arms was deferred till his successor had shown himself equal to the task.

It was not only in Afghanistan that the new imperial policy which Lord Beaconsfield had done so much to encourage was straining the resources of the empire. In South Africa a still more serious difficulty was already commencing. At the time at which Lord Beaconsfield's administration began, British territory in South Africa was practically confined to Cape Colony and Natal. Years before, in 1852 and 1854 respectively, the Boers, who were the inhabitants of the responsibilities of colonial rule, had recognized the independence of the two Dutch republics, the Transvaal and the Orange Free State. Powerful native tribes occupied the territory to the north of Natal and the east of the Transvaal. War broke out between the Transvaal Republic and one of the most powerful of these native chieftains, Sikuku; and the Transvaal was worsted in the struggle. Weary of the condition of anarchy which existed in the republic, most of the inhabitants of the Transvaal were ready to welcome its annexation to Great Britain, provided it was favoured by the colonial secretary, Lord Carnarvon, who wished to federate the South African states, after the manner in which the North American colonies had become by federations the Dominion of Canada. Sir Theophilus Shepstone, who was sent to inquire into the proposal, mistook the opinion of a party for the verdict of the republic, and declared (April 1877) the Transvaal a part of the British Empire. His policy entailed far more serious consequences than the mission to Afghanistan. The first was a war with the Zulus, the most powerful and warlike of the South African natives, who under their ruler, Cetewayo, had organized a formidable army. A dispute had gone on for some time about the possession of a strip of territory which some British arbitrators had awarded to the Zulu king. Sir Bartle Frere, who had won distinction in India, and was sent out by Lord Beaconsfield's government to the Cape, kept back the award; and, though he ultimately communicated it to Cetewayo, thought it desirable to demand the disbandment of the Zulu army. In the war which ensued, the British troops who invaded Zulu territory met with a severe reverse; and, though the disaster was ultimately retrieved by Lord Chelmsford, the war involved heavy expenditure and brought little credit to the British army, while one unfortunate incident, the death of Prince Napoleon, who had obtained leave to serve with the British troops, and was surprised by the Zulus while reconnoitring, created a deep and lasting irritation in Imperialism, which had been excited by Lord Beaconsfield's policy in 1878, and by the prospect of a war with a great European power, fell into discredit when it degenerated into a fresh expedition into
Afghanistan, and an inglorious war with a savage African tribe. A period of distress at home increased the discontent which Lord Beaconsfield's external policy was exciting; and, when parliament was at last dissolved in 1886, it seemed no longer certain that the country would endorse the policy of which he had been the chief exponent. As early as 1882, only a short time before he had acquired such popularity. Gladstone, emerging from his retirement, practically placed himself again at the head of the Liberal party. In a series of speeches in Midlothian, where he offered himself for election, he denounced the whole policy which Lord Beaconsfield had pursued. His impassioned eloquence did much more than influence his own election. His speeches decided the contest throughout the kingdom. The Liberals secured an even more surprising success than that which had rewarded the Conservatives six years before. For the first time in the queen's reign, a solid Liberal majority, independent of all extraneous Irish support, was returned, and Gladstone resumed in triumph his old position as prime minister.

The new minister had been swept into power on a wave of popular favour, but he inherited from his predecessors difficulties in almost every quarter of the world; and his own language had perhaps tended to increase them. He was committed to a reversal of Lord Beaconsfield's policy; and, in politics, it is never easy, and perhaps rarely wise, suddenly and violently to change a system. In one quarter of the world the new minister achieved much success. The war in Afghanistan, which had begun with disaster, was creditably concluded. A better understanding was gradually established with Russia; and, before the ministry went out, steps had been taken which led to the delimitation of the Russian and Afghan frontier. In South Africa, however, a very different result ensued. Gladstone, before he accepted office, had denounced the policy of annexing the Transvaal; his language was so strong that he was charged with encouraging the Boers to maintain their independence by force; his example had naturally been imitated by some of his followers at the general election; and, when he resumed power, he found himself in the difficult dilemma of either maintaining an arrangement which he had declared to be unwise, or of yielding to a demand which the Boers were already threatening to support in arms. Events of the first year of his administration added to his difficulty. Before its close the Boers seized Heidelberg and established a republic; they destroyed a detachment of British troops at Bronkhorst Spruit; and they surrounded and attacked the British garrison in the Transvaal. Troops were of course sent from England to maintain the British cause; and Sir George Colley, who enjoyed a high reputation and had experience in South Africa, was now called upon to command the forces trusted with the military command. The events which immediately followed will not be easily forgotten. Wholly mis-calculating the strength of the Boers, Sir George Colley, at the end of January 1881, attacked them at Laing's Nek, in the north of Natal, and was repulsed with heavy loss. Some ten days afterwards he fought another action on the Ingogo, and was again forced to retire. On the 26th February, with some 600 men, he occupied a hill known as Majuba, which, he thought, dominated the Boer position. The following day the Boers attacked the hill, overwhelmed its defenders, and Sir George Colley was himself killed in the disastrous contest on the summit. News of these occurrences was received with dismay in England. It was, no doubt, possible to say a good deal for Gladstone's indignant denunciation of his predecessor's policy in annexing the Transvaal; it would have been equally possible to advance many reasons for reversing the measures of Lord Beaconsfield, who thought his cabinet, and for conceding independence to the Transvaal in 1880. But the great majority of persons considered that, whatever arguments might have been urged for concession in 1880, when British troops had suffered no reverses, nothing could be said for concession in 1881, when their arms had been tarnished by a humiliating disaster. Great countries can afford to be generous in the hour of victory; but they cannot yield, without loss of credit, in the hour of defeat. Unfortunately this reasoning was not suited to Gladstone's temperament. The justice or injustice of the British cause seemed to him a much more important matter than the vindication of military honour; and he could not bring himself to acknowledge that Majuba had altered the situation, and that the terms which he had made up his mind to concede before the battle could not be safely granted till military reputation was restored. The retrocession of the Transvaal was decided upon, though it was provided that the country should remain under the suzerainty of the queen. Even this great concession did not satisfy the ambition of the Boers, who were naturally elated by their victories. Three years later some Transvaal deputies, with their president, Kruger, came to London and saw Lord Derby, the secretary of state for the colonies. Lord Derby consented to a new convention, from which any verbal reference to suzerainty was excluded; and the South African republic was made independent, subject only to the condition that it should conclude no treaties with foreign powers without the approval of the crown. (For the details and disputes concerning the terms of this convention the reader is referred to the articles Transvaal and Suzerainty.)

Gladstone's government declined in popularity from the date of the earliest of these concessions. Gladstone, in fact, had succeeded in doing what Lord Beaconsfield had failed to accomplish. Annoyance at his foreign policy had rekindled the imperialism which the embarrassments created by Lord Beaconsfield had done so much to damp down. And, if things were going badly with the new government abroad, matters were not progressing smoothly at home. At the general election of 1880, the borough of Northampton, which of late years has shown an unwavering preference for Liberals of an advanced type, returned as its members Henry Labouchere and Charles Bradlaugh. Bradlaugh, who had attained some notoriety for his aggressive atheism, claimed the right to make an affirmation of allegiance instead of taking the customary oath, which he declared was, in his eyes, a meaningless form. The speaker, instead of deciding the question, submitted it to the judgment of the House, and it was ultimately referred to a select committee, which reported against Bradlaugh's claim. Bradlaugh, on hearing the decision of the committee, presented himself at the bar and offered to take the oath. It was objected that, as he had publicly declared that the words of the oath had no clear meaning for him, he could not be permitted to take it; and after some wrangling the matter was referred to a fresh committee, which supported the view that Bradlaugh could not be allowed to be sworn, but recommended that he should be permitted to make the affirmation at his own risk. The House of Commons confirmed the decision of the select committee, and a bill was introduced to give effect to it. This decision naturally enlarged the question before it. For, while hitherto the debate had turned on the technical points whether an affirmation could be substituted for an oath, or whether a person who had declared that an oath had no meaning for him could properly be sworn, the end at which Bradlaugh's opponents were theretofore aiming was the imposition of a new religious test—the belief in a God—on members of the House of Commons. The controversy, which thus began, continued through the parliament of 1886, and led to many violent scenes, which lowered the dignity of the House. It was quietly terminated, in the parliament of 1886, by the firm action of a new speaker. Mr Peel, who had been elected to the chair in 1884, decided that neither the speaker nor any other member had the right to intervene to prevent a member from taking the oath if he was willing to take it. Parliament subsequently, by a new act, permitted affirmations to be used, and thenceforward religion, the absence of religion, was no disqualification for a seat in the House of Commons. The atheist, like the Roman Catholic and the Jew, could sit and vote.

The Bradlaugh question was not the only difficulty with which the new government was confronted. Ireland was again attracting the attention of politicians. The Fenian movement had practically expired; some annual motions for the introduction of Home Rule, made with all the decorum of
parliamentary usage, had been regularly defeated. But the Irish were placing themselves under new leaders and adopting new methods. During the Conservative government of 1874, the Irish members had endeavoured to arrest attention by organized obstruction. Their efforts had increased the difficulties of government and taxed the endurance of parliament.

These tactics were destined to be raised to a fine art by Parnell, who succeeded to the head of the Irish party about the time of the formation of Gladstone’s government. It was Parnell’s determination to make legislation impracticable, and parliament unendurable, till Irish grievances were redressed. It was his evident belief that by pursuing such tactics he could force the House of Commons to concede the legislation which he desired. The Irish members were not satisfied with the legislation which parliament had passed in 1869–70. The land act of 1870 had given the tenant no security in the case of eviction for non-payment of rent; and the tenant whose rent was too high or had been raised was at the mercy of his landlord. It so happened that some bad harvests had temporarily increased the difficulties of the tenantry, and there was no doubt that large numbers of evictions were taking place in Ireland. In these circumstances, the Irish contended that the relief which the act of 1870 had afforded should be extended, and that, till such legislation could be devised, a temporary measure should be passed giving the tenant compensation for disturbance. Gladstone admitted the force of this reasoning, and a bill was introduced to meet it. But Parnell threw out the bill; it was thrown out towards the end of the session by the Lords; and the government acquiesced—perhaps could do nothing but acquiesce—in this decision. In Ireland, however, the rejection of the measure was attended with disastrous results. Outrages increased, obnoxious landlords and agents were "boycotted"—the name of the first gentleman exposed to this treatment adding a new word to the language; and Forster, who had accepted the office of chief secretary, thought it necessary, in the interest of security and intimidation, to adopt stringent measures for enforcing order. A measure was passed on his initiative, in 1881, authorizing him to arrest and detain suspected persons; and many well-known Irishmen, including Parnell himself and other members of parliament, were thrown into prison. It was an odd commentary on parliamentary government that a Liberal ministry should be in power, and that Irish members should be in prison; and early in 1882 Gladstone determined to liberate these prisoners on condition of their accepting the new measures on coercion. The new policy—represented by what was known as the Kilmarnock Treaty—led to the resignation of the viceroy, Lord Cowper, and of Forster, and the appointment of Lord Spencer and Lord Frederick Cavendish as their successors. On the 6th of May 1882 Lord Spencer made his entry into Dublin, and on the evening of the same day Lord Frederick, unwisely allowed to walk home alone with Burke, the under-secretary to the Irish government, was murdered with his companion in Phoenix Park. This gross outrage led to fresh measures of coercion. The disclosure, soon afterwards, of a conspiracy to resort to dynamite still further alienated the sympathies of the Liberal party from the Irish nation. Gladstone might fairly plead that he had done much, that he had risked much, for Ireland, and that Ireland was making him a poor return for his services.

In the meanwhile another difficulty was further embarrassing a harassed government. The necessities of the khedive of Egypt had been only temporarily relieved by the sale to Lord Beaconsfield’s government of the Suez Canal shares. Egyptian finance, in the interests of the bondholders, had been placed under the dual control of England and France. The new arrangement naturally produced some native resentment, and Arabi Pasha placed himself at the head of a movement which was intended to rid Egypt of foreign interference. His preparations eventually led to the bombardment of Alexandria by the French fleet still holding the invasion lane of Egypt by a British arm under Sir Garnet, afterwards Lord Wolseley, and to the battle of Tell-el-Kebir, after which Arabi was defeated and taken prisoner. The bombardment of Alexandria led to the immediate resignation of Bright, whose presence in the cabinet had been of importance to the government; the occupation of Egypt broke up the dual control, and made Great Britain responsible for Egyptian administration. The effects of British rule were, in one sense, remarkable. The introduction of good government increased the prosperity of the people, and restored confidence in Egyptian finance. At the same time it provoked the animosity of the French, who were naturally jealous of the increase of British influence on the Nile, and it also threw new responsibilities on the British nation. For south of Egypt lay the great territory of the Sudan, which to some extent commands the Nile, and which had been added to the Egyptian dominions at various periods between 1820 and 1875. In 1881 a fanatic sheikh—known as the mahdi—had headed an insurrection against the khedive’s authority; and towards the close of 1883 an Egyptian army under an Englishman, Colonel Hicks, was annihilated by the mahdi’s followers. The insurrection increased the responsibilities which intervention had imposed on England, and an expedition was sent to Suakin to guard the littoral of the Red Sea; while, at the beginning of 1884, General Gordon—whose services in China had gained him a high reputation, and who had had previous experience in the Sudan—was sent to Khartoum to report on the condition of affairs. These decisions led to momentous results. The British expedition to Suakin was engaged in a series of battles with Osman Digna, the mahdi’s lieutenant; while General Gordon, after altercations which reversed and almost annihilated the Conservative forces under Lord Kharthum. Anxious as Gladstone’s ministry was to restrict the sphere of its responsibilities, it was compelled to send an expedition to relieve General Gordon; and Lord Wolseley, who was appointed to the command, decided on moving up the Nile to his relief. The expedition proved much more difficult than Lord Wolseley had anticipated. And before it reached its goal, Khartoum was forced to surrender, and General Gordon and his few followers were murdered (January 1885). The news of General Gordon’s death inflicted a fatal blow on the Liberal government. It was thought that the general, whose singular devotion to duty made him a popular hero, had been allowed to assume an impossible task; had been feebly supported; and that the measures for his relief had been unduly postponed and at last only reluctantly undertaken. The ministry ultimately experienced defeat on a side issue. The budget, which Childers brought in February, was defeated by 290 against 220, and the chancellor of the Exchequer was sacked by his Conservative party; and an amendment proposed by Sir Michael Hicks-Beach, condemning an increase in the duties on spirits and beer, was adopted by a small majority. Gladstone resigned office, and Lord Salisbury, who, after Lord Beaconsfield’s death, had succeeded to the lead of the Conservative party, was instructed to form a new administration.

It was obvious that the new government, as its first duty, would be compelled to dissolve the parliament that had been elected when Gladstone was enjoying the popularity which he had lost so rapidly in office. But it so happened that it was no longer possible to appeal to the old constituencies. For, in 1884, Gladstone had introduced a new Reform Bill; and, though its passage had been arrested by the Lords, unofficial communications between the leaders of both parties had resulted in a compromise which had led to the adoption of a large and comprehensive Reform Act. By this measure, household franchise was extended to the counties. But counties and boroughs were broken up into a number of small constituencies, for the most part returning only one member each; while the necessity of increasing the relative weight of Great Britain, and the reluctance to inflict disfranchisement on Ireland, led to an increase in the numbers of the House of Commons from 658 to 670 members. This radical reconstruction of the electorate necessarily made the result of the elections doubtful. As a matter of fact, the new parliament comprised 334 Liberals, 250 Conservatives and 86 Irish Nationalists. It was plain beyond the possibility of doubt that the future depended on the course which the Irish Nationalists might adopt. They threw in their lot with Gladstone, Lord Salisbury’s
government was evidently doomed. If, on the contrary, they joined the Conservatives, they could make a Liberal administration impracticable.

In the autumn of 1885 it was doubtful what course the Irish Nationalists would take. It was generally understood that Lord Carnarvon, who had been made viceroy of Ireland, had been in communication with Parnell, that Lord Salisbury was aware of the interviews which had taken place; and it was whispered that Lord Carnarvon was in favour of granting some sort of administrative autonomy to Ireland. Whatever opinion Lord Carnarvon may have formed—and his precise view is uncertain—a greater man than he had suddenly arrived at a similar conclusion. In his election speeches Gladstone had insisted on the necessity of the country returning a Liberal majority which could act independently of the Irish vote; and the result of the general election had left the Irish the virtual arbiters of the political situation. In these circumstances Gladstone arrived at a momentous decision. He recognized that the system under which Ireland had been governed in the past had failed to win the allegiance of her people; and he decided that it was wise and safe to entrust her with a large measure of self-government. It was perhaps characteristic of Gladstone, though it was unquestionably characteristic of the man, in determining on this radical change of policy, he consulted few, if any, of his previous colleagues.

On the meeting of the new parliament Lord Salisbury's government was defeated on an amendment to the address, demanding facilities for agricultural labourers to obtain small holdings for gardens and pasture—the policy, in short, which was described as "three acres and a cow." Lord Salisbury resigned, and Gladstone resumed power. The attitude, however, which Gladstone was understood to be taking on the subject of Home Rule threw many difficulties in his way. Lord Hartington, and others of his former colleagues, declined to join his administration; Mr Chamberlain, who, in the first instance, accepted office, retired almost at once from the ministry; and Bright, whose eloquence and past services gave him a unique position in the House, threw in his lot in opposition to Home Rule. A split in the Liberal party thus began, which was destined to endure; and Gladstone found his difficulties increased by the defection of the men on whom he had hitherto largely relied. He persevered, however, in the task which he had set himself, and introduced a measure endowing Ireland with a parliament, and excluding the Irish members from Westminster. He was defeated, and appealed from the House which had refused to support him to the country. For the first time in the queen's reign two general elections occurred within twelve months. The country showed no more disposition than the House of Commons to approve of a system which the Irishman—for whom the solution of the Irish question was the object of every other thought in the House—had taken on trust. By a large majority of the members of the new parliament were pledged to resist Home Rule. Gladstone, bowing at once to the verdict of the people, resigned office, and Lord Salisbury returned to power.

The new cabinet, which was formed to resist Home Rule, did not succeed in combining all the opponents to this measure. The secessionists from the Liberal party—the Liberal Unionists, as they were called—were defeated in the resounding elections, and Lord Salisbury was forced to form his cabinet out of his immediate followers. The most picturesque appointment was that of Lord Randolph Churchill, who was made chancellor of the exchequer and leader of the House of Commons. But before many months were over, Lord Randolph—unable to secure acceptance of a policy of financial retrenchment—resigned office, and Lord Salisbury was forced to reconstrue his ministry. Though he again failed to obtain the co-operation of the Unionists, one of the more prominent of them—Goschen—accepted the seals of the Exchequer. W. H. Smith moved from the war office to the treasury, and became leader of the House of Commons; while Lord Salisbury himself returned to the foreign office, which the dramatically sudden death of Lord Iddesleigh, better known as Sir Stafford Northcote, vacated. These arrangements lasted till 1891, when, on Smith's death, the treasury and the lead of the Commons were entrusted to Lord Salisbury's nephew, Mr Arthur Balfour, who had made a great reputation as chief secretary for Ireland.

The ministry of 1886, which endured till 1892, gave to London a county council; introduced representative government into every English county; and made elementary education free through-out England. The nature of the Liberal Unionism was, in fact, compelling the Conservative government to promote measures which were not wholly consistent with the stricter Conservative traditions, or wishes. In other respects, the legislative achievements of the government were not great; and the time of parliament was largely occupied in devising rules for the conduct of its business, which the obstructive attitude of the Irish members made necessary, and in discussing the charges brought against the Home Ruler by The Times, of complicity in the Phoenix Park murders. Under the new rules, the sittings of the House on ordinary days were made to commence at 3 p.m., and opposed business was automatically interrupted at midnight, while for the first time a power was given to the majority in a House of a certain size to conclude debate by what was known as the closure. Notwithstanding these new rules obstructive tactics continued to prevail; and, in the course of the parliament, many members were suspended for ten days. Resentment of the hostility of the majority members was perhaps increased by some natural indignation at the charges brought against Parnell. The Times, in April 1887, printed the facsimile of a letter purporting to be signed by Parnell, in which he declared that he had no other course open to him but to denounce the Phoenix Park murders, but that, while he regretted the "accident" of Lord Frederick Cavendish's death, he could not "refuse to admit that Burke got no more than his deserts." The publication of this letter, and later of other similar documents, naturally created a great sensation; and the government ultimately appointed a special commission of three judges to inquire into the charges and allegations that were made. In the course of the inquiry it was proved that the letters had emanated from a man named Pigott, who had at one time been associated with the Irish Nationalist movement, but who for some time past had earned a precarious living by writing begging and threatening letters. Pigott, subjected to severe cross-examination by Sir Charles Russell (afterwards Lord Russell of Killowen), broke down, fled from justice and committed suicide. His flight practically settled the question; and an inquiry, which many people had thought at its inception would brand Parnell as a criminal, raised him to an influence which he had never enjoyed before. But in the same year which witnessed his triumph, he was doomed to fall. He was made co-resident in a divorce suit brought by Captain O'Shea—much to the disgust of the Irish nation—for which Gladstone was taken as a solution of the disclosures made at the trial induced Gladstone, who was supported by the Nonconformists generally throughout the United Kingdom, to request Parnell to withdraw from the leadership of the Irish party. Parnell refused to comply with this request, and the Irish party was shattered into fragments by his decision. Parnell himself did not long survive the disruption of the party which he had done so much to create. The exertions which he made to retrieve his waning influence proved too much for his strength, and in the autumn of 1891 he died suddenly at Brighton. Parnell's death radically altered the political situation. At the general elections of 1885 and 1886 the existence of a strong, united Irish party had exercised a dominating influence. As the parliament of 1886 was drawing to a close, the disensions among the Irish members, and the loss of their great leader, were visibly sapping the strength of the Nationalists. At the general election of 1892 Home Rule was still supported by two-thirds of the electors before the elections. But the English Liberals were already a little weary of allies who were quarrelling among themselves, and whose disputes were introducing a new factor into politics. The political struggle virtually turned not on measures, but on men. Gladstone's great age, and the marvellous powers which he displayed at a time when most men seek the repose of
retirement, were the chief causes which affected the results. His influence enabled him to secure a small Liberal majority. But it was noticed that the majority depended on Scottish, Irish and Welsh votes, and that England—the "predominant partner," as Gladstone contemptuously called it—supported a majority of members pledged to resist any attempt to dissolve the union between the three kingdoms.

On the meeting of the new parliament Lord Salisbury's government was defeated on a vote of want of confidence, and for a fourth time Gladstone became prime minister.

In the session of 1893 he again introduced a Home Rule Bill. But the measure of 1893 differed in many respects from that of 1886. In particular, the Irish were no longer to be excluded from the imperial parliament at Westminster. The bill which was thus brought forward was actually passed by the Commons. It was, however, rejected by the Lords. The dissensions among the Irish themselves, and the hostility which English constituencies were displaying to the proposal, emboldened the Peers to arrive at this decision. Some doubt was felt as to the course which Gladstone would take in this crisis. Many persons thought that he should at once have appealed to the country, and have endeavoured to obtain a distinct mandate from the constituencies to introduce a new Home Rule Bill. Other persons imagined that he should have followed the precedent which had been set by Lord Grey in 1831, and, after a short prorogation, have reintroduced his measure in a new session. As a matter of fact, Gladstone adopted neither of these courses. The government decided not to take up the gauntlet thrown down by the Peers, but to proceed with the rest of their political programme. With this object an autumn session was held, and the Parish Councils Act, introduced by Mr Fowler (afterwards Lord Wolverhampton), was passed, after important amendments, which had been introduced into it in the House of Lords, had been reluctantly accepted by Gladstone. On the other hand, an Employers' Liability Bill, introduced by Mr Asquith, the home secretary, was ultimately dropped by Gladstone after passing all stages in the House of Commons, rather than that an amendment of the Peers, allowing "contracting out," should be accepted.

Before, however, the session had quite run out (3rd March 1894), Gladstone, who had now completed his eighty-fourth year, laid down a load which his increasing years made it impossible for him to sustain (see the article GLADSTONE). He was succeeded by Lord Rosebery, whose abilities and attainments had raised him to a high place in the Liberal councils. Lord Rosebery did not succeed in popularizing the Home Rule proposal which Gladstone had fall. He declared, indeed, that success was not attainable till England was converted to its expediency. He hinted that success would not even then be assured until something was done to reform the constitution of the House of Lords. But if, on the one hand, he refused to introduce a new Home Rule Bill, he hesitated, on the other, to court defeat by any attempt to reform the Lords. His government, in these circumstances, while it failed to conciliate its opponents, excited no enthusiasm among its supporters. It was generally understood, moreover, that a large section of the Liberal party resented Lord Rosebery's appointment to the first place in the ministry, and thought that the lead should have been conferred on Sir W. Harcourt. It was an open secret that these differences in the party were reflected in the cabinet, and that the relations between Lord Rosebery and Sir W. Harcourt were too strained to ensure either the harmonious working of the stability of the administration. In these circumstances the fall of the ministry was only a question of time. It occurred—as often happens in parliament—on a minor issue which no one had foreseen. Attention was drawn in the House of Commons to the insufficient supply of cordite provided by the war office, and the House—notwithstanding the assurance of the war minister (Sir Henry Campbell-Bannerman) that the supply was adequate—placed the government in a minority. Lord Rosebery resigned office, and Lord Salisbury for the third time became prime minister, the duke of Devonshire, Mr Chamberlain and other Liberal Unionists joining the government. Parliament was dissolved, and a new parliament, in which the Unionists obtained an overwhelming majority, was returned.

The government of 1892–1895, which was successively led by Gladstone and Lord Rosebery, will, on the whole, be remembered for its failures. Yet it passed two measures which have had a wide influence. The Parish Councils Act introduced electoral institutions into the government of every parish, and in 1894 Sir W. Harcourt, as chancellor of the exchequer, availed himself of the opportunity, which a large addition to the navy invited, to reconstruct the death duties. He swept away in doing so many of the advantages which the owner of real estate and the life tenant of settled property had previously enjoyed, and drove home a principle which Gladstone had tentatively introduced a few years before by increasing the rate of the duty with the amount of the estate. Rich men, out of their superfluities, were thenceforward to pay more than poor men out of their necessities.

The Unionist government which came into power in 1895 lasted, with certain changes of personnel, till 1905, with a break caused by the dissolution of 1900. History may hereafter conclude that the most significant circumstance of the earlier period is to be found in the demonstration of loyalty and affection to which the sixtieth anniversary of Queen Victoria's accession led in 1897. Ten years before, her jubilee had been the occasion of enthusiastic rejoicings, and the Queen's progress through London to a service of thanksgiving at Westminster had impressed the imagination of her subjects and proved the affection of her people. But the rejoicings of 1887 were forgotten amid the more striking demonstrations ten years later. It was seen then that the Queen, by her conduct and character, had gained a popularity which has had no parallel in history, and had won a place in the hearts of her subjects which perhaps no other monarch had ever previously enjoyed. There was no doubt that, if the opinion of the English-speaking races throughout the world could have been tested by a plebiscite, an overwhelming majority would have declared that the fittest person for the rule of the British empire was the gracious and kindly lady who for sixty years, in sorrow and in joy, had so worthily discharged the duties of her high position. The remarkable demonstration was not confined to the British empire alone. In every portion of the globe the sixty-sixth anniversary of the queen's reign excited interest; in every country the queen's name was mentioned with affection and respect; while the people of the United States vied with the subjects of the British empire in praise of the queen's character and in expressions of regard for her person. Only a year or two before, an obscure dispute on the boundary of the British and American possessions between the United States and Great Britain within sight of a quarrel. The jubilee showed conclusively that, whatever politicians might say, the ties of blood and kinship, which united the two peoples, were too close to be severed by either for some trifling cause; that the wisest heads in both nations were aware of the advantages which must arise from the closer union of the Anglo-Saxon races; and that the true interests of both countries lay in their mutual friendship. A war in which the United States was subsequently engaged with Spain cemented this feeling. The government and the people of the United States recognized the advantage which they derived from the goodwill of Great Britain in the hour of their necessity, and the two nations drew together as no other two nations had perhaps ever been drawn together before.

If the jubilee was a proof of the closer union of the many sections of the British empire, and of their warm attachment to their sovereign, it also gave expression to the "imperialism" which was becoming a dominant factor in British politics. Few people realized the mighty change which in this respect had been effected in thought and feeling. Forty years before, the most prominent English statesmen had regarded with anxiety the huge responsibilities of a world-wide empire. In 1897 the whole tendency of thought and opinion was to enlarge the burden of which the preceding generation had been weary. The extension of British influence, the protection of British interests, were almost universally advocated; and the few statesmen who
repeated in the 'nineties the sentiments which would have been generally accepted in the 'sixties, were regarded as Little Englanders. It is important to note the consequences which might follow the new ideals set up in Africa in the north and in the south of this great and imperfectly explored continent, memories still clutch which were ungrateful to imperialism. In the north, the murder of Gordon was still unavenged; and the vast territory known as the Sudan had escaped from the control of Egypt. In the south, war with the Transvaal had been concluded by a British defeat; and the Dutch were elated, the English irritated, at the recollection of Majuba. In 1886 Lord Salisbury's government extended its influence in South Africa. Lord Chelmsford took the Sudan, and an expedition was sent from Egypt under the command of Sir Herbert (afterwards Lord) Kitchener to Khartoum. Few military expeditions have been more elaborately organized, or have achieved a more brilliant success. The conquest of the country was achieved in three separate campaigns in successive years. In September 1898 the Sudanese forces were decisively beaten, with great slaughter, in the immediate neighbourhood of Omdurman; and Khartoum became the foremost city in the capital of the new province, which was placed under Lord Kitchener's rule. Soon after this decisive success, it was found that a French expedition under Major Marchand had reached the upper Nile and had hoisted the French flag at Fahsoda. It was obvious that the French could not be allowed to remain at a spot which the khedive of Egypt claimed as Egyptian territory; and after some negotiation, and some irritation, the French were withdrawn. In South Africa still more important events were in the meanwhile progressing. Ever since the independence of the South African Republic had been virtually conceded by the convention of 1884, unhappy differences had prevailed between the Dutch and British residents in the Transvaal. The discovery of gold at Johannesburg and elsewhere in 1885-1886 had led to a large immigration of British and other colonists. Johannesburg had grown into a great and prosperous city. The foreign population of the Transvaal, which was chiefly English, became in a few years more numerous than the Boers themselves, and they complained that they were deprived of all political rights, that they were subjected to unfair taxation, and that they were hampered in their industry and unjustly treated by the Dutch courts and Dutch officials. Failing to obtain redress, at the end of 1895 certain persons among them made preparations for a revolution. Dr Jameson, the administrator of Rhodesia, accompanied by some British officers, actually invaded the Transvaal. The purpose of the invasion was inadequate for the purpose, was stopped by the Boers, and he and his fellow-officers were taken prisoners.

Jameson Raid.

There was no doubt that this raid on the territory of a friendly state was totally unjustifiable. Unfortunately, Dr Jameson's original plans had been framed at the instance of Cecil Rhodes, the prime minister at the Cape, and many persons thought that they ought to have been suspected by the colonial office in London. England at any rate would have had no valid ground of complaint if the leaders of a buccaneering force had been summarily dealt with by the Transvaal authorities. The president of the republic, Kruger, however, handed over his prisoners to the British authorities, and parliament instituted an inquiry by a select committee into the circumstances of the raid. The inquiry was terminated somewhat abruptly. The committee acquiesced the colonial office of any knowledge of the plot; but a good many suspicions remained unanswered. The chief actors in the raid were tried under the Foreign Enlistment Act, found guilty, and subsequently released after short terms of imprisonment. Rhodes himself was not removed from the privy council, as his more extreme accusers demanded; but he had to abandon his career in Cape politics for a time, and confine his energies to the development of Rhodesia, which had been added to the empire through his instrumentality in 1888-1889.

In consequence of these proceedings, the Transvaal authorities at once commenced preparations of the British forces in the Transvaal in procuring vast quantities of artillery and military stores. The British government would undoubtedly have been entitled to insist that these armaments should cease. It was obvious that they could only be directed against Great Britain; and no nation is bound to allow another people to prepare great armaments to be employed against itself. The criminal folly of the raid prevented the British government from making this demand. It could not say that the Transvaal government had no cause for alarm when British officers had attempted an invasion of its territory, and had been treated rather as heroes than as criminals at home. Ignorant of the strength of Great Britain, and elated by the recollection of their previous successes, the Boers themselves believed that a new struggle might give them triumphs similar to those of the 'eighties. They were not aware that a large portion of the population of Cape Colony was of Dutch extraction, and that public men at the Cape sympathized with them in their aspirations, increased their confidence. In the meantime, while the Boers were silently and steadily continuing their military preparations, the British settlers at Johannesburg—the Uitlanders, as they were called—continued to demand consideration for their grievances. In the spring of 1899, Sir Alfred Milner, governor of the Cape, met President Kruger at Bloemfontein, the capital of the Orange Free State, and endeavoured to accomplish that result by negotiation. He thought, at the time, that if the Uitlanders were given the franchise and a fair proportion of influence in the legislature, other difficulties might be left to settle themselves. The negotiations thus commenced unfavourably failed. The discussion, which had originally turned on the franchise, was enlarged by the introduction of the question of suzerainty or supremacy; and at last, in the beginning of October, Lord Roberts arrived. The rains of an African spring were causing the grass to grow on which the Boer armies were largely dependent for forage, the Boers declared war and invaded Natal. The British government had not been altogether happy in its conduct of the preceding negotiations. It was certainly unhappy in its preparations for the struggle. It made the great mistake of underestimating the strength of its enemy; it suffered its agents to commit the strategic blunder of locking up the few troops it had in an untenable position in the north of Natal. It was not surprising, in such circumstances, that the earlier months of the war should have been memorable for a series of exasperating reverses. These reverses, however, were redeemed by the valour of the British troops, the spirit of the British nation, and the enthusiasm which induced the great autonomous colonies of the empire to send men to support the cause of the mother country. The gradual arrival of reinforcements, and the assumption of a soldier's mettle by Lord Roberts, to whom was given the supreme command, changed the military situation; and, before the summer of 1900 was concluded, the places which had been besieged by the Boers—Kimberley, Ladysmith and Mafeking—had been successively relieved; the capitals of the Orange Free State and of the Transvaal had been occupied; and the two republics, which had rashly declared war against the British empire, had been formally annexed.

The defeat and dispersal of the Boer armies, and the apparent collapse of Boer resistance, induced a hope that the war was over; and the government seized the opportunity in 1900 to terminate the parliament, which had already endured for more than five years. The election was conducted with unusual bitterness; but the constituencies practically affirmed the policy of the government by maintaining, almost unimpaired, the large majority which the Unionists had secured in 1895. Unfortunately, the expectations which had been formed at the time of the dissolution were disappointed. The same circumstances which had emboldened the Boers to declare war in the autumn of 1899, induced them to renew a guerrilla warfare in the autumn of 1900—the approach of an African summer supplying the Boers with the grass on which they were dependent for feeding their hardy horses. Guerrilla bands suddenly appeared in different parts of the Orange River Colony and of the Transvaal. They interrupted the communication of the British forces; they destroyed the railroads; they captured the British detachments; they invaded Cape Colony. Thus the last year of the century closed in disappointment.
and gloom. The serious losses which the war entailed, the heavy expenses which it involved, and the large force which it absorbed, filled thoughtful men with anxiety.

No one felt more for the sufferings of her soldiers, and no one regretted more truly the useless prolongation of the struggle, than the venerable lady who occupied the throne. She had herself lost a grandson (Prince Christian Victor) in South Africa; and sorrow and anxiety perhaps told even on a constitution so unusually strong as hers. About the middle of January 1901 it was known that she was seriously ill; on the 22nd she died. The death of the queen thus occurred immediately after the close of a century over so long a period of which her reign had extended.

The queen's own life is dealt with elsewhere (see Victoria, Queen), but the Victorian era is deeply marked in English history. During her reign the people of Great Britain doubled their number; but the accumulated wealth of the country increased at least threefold, and its trade sixfold. All classes shared the prevalent prosperity. Notwithstanding the increase of population, the roll of paupers at the end of the reign, compared with the same roll at the beginning, stood as 2 stands to 3; the criminals as 1 to 2. The expansion abroad was still more remarkable. There were not 200,000 white persons in Australasia when the queen came to the throne; there were nearly 5,000,000 when she died. The great Australian colonies were almost created in her reign; two of them—Victoria and Queensland—owe their name to her; they all received those autonomous institutions, under which their prosperity has been built up, during its continuance. Expansion and progress were not confined to Australasia. The opening months of the queen's reign were marked by rebellion in Canada. The close of it saw Canada one of the most loyal portions of the Empire. In Africa, the advance of the red line which marks the bounds of British dominion was even more rapid; while in India the Punjab, Sind, Oudh and Burmah were some of the acquisitions added to the British empire while the queen was on the throne. When she died one square mile in four of the land in the world was under the British flag, and at least one person out of every five persons alive was a subject of the queen.

Material progress was largely facilitated by industry and invention. The first railways had been made, the first steamship had been built, before the queen came to the throne. But, so far as railways are concerned, none of the great trunk lines had been constructed in 1837; the whole capital authorized to be spent on railway construction did not exceed £55,000,000; and, five years after the reign had begun, there were only 18,000 passengers. The paid-up capital of British railways in 1901 exceeded £1,100,000,000; the passengers, not including season-ticket-holders, also numbered 1,100,000,000; and the sum annually spent in working the lines considerably exceeded the whole capital authorized to be spent on their construction in 1837. The progress of the commercial marine was still more noteworthy. In 1837 the entire commercial navy comprised 2,800,000 tons, of which less than 100,000 tons were moved by steam. At the end of the reign the tonnage of British merchant vessels had reached 13,700,000 tons, of which more than 11,000,000 tons were moved by steam. At the beginning of the reign it was supposed to be impossible to build a steamer which could either cross the Atlantic, or face the monsoon in the Red Sea. The development of steam navigation since then had made Australia much more accessible than America was in 1837, and had brought New York, for all practical purposes, nearer to London than Aberdeen was at the commencement of the reign. Electricity had even a greater effect on communication than steam on locomotion; and electricity, as a practical invention, had its origin in the reign. The first experimental telegraph line was only erected in the year in which Queen Victoria came to the throne. Submarine telegraphy, which had done so much to knit the empire together, was not perfected for another 10 years; and long ocean cables were almost entirely constructed in the last half of the reign.

(S. W.)

On the death of Queen Victoria, the prince of Wales succeeded to the throne, with the title of Edward VII. (q.v.). The coronation fixed for June in the following year was at the last moment stopped by the king's illness and by his determined wish to avoid the pageantry of the court. He retired to his hold at Osborne in Hampshire, but recovered marvellously from the operation and the ceremony took place in August. His excellent health and activity in succeeding years struck every one with astonishment. The Boer War had at last been brought to an end in May 1902 (see TRANSVAAL), and the king had the satisfaction of seeing South Africa settle down and eventually receive self-government. The political history of his reign, which ended with his death in January 1910, is dealt with in detail in separate biographical and other articles in this work (see especially those on Lord Salisbury, Mr. A. J. Balfour, Mr. Chamberlain, Lord Rosebery, Sir H. Campbell-Bannerman, Mr. H. H. Asquith, Mr. D. Lloyd George, and on the history of the various portions of the British Empire); and in this place only a summary need be given. The king himself (see Edward VII), who nobly earned the title of Edward the Peacemaker, played no small part in the domestic and international politics of these years; and contemporary publicists, who had become accustomed to Victorian traditions, gradually realized that, within the limits of the constitutional monarchy, there was much more scope for the initiative of a masculine sovereign in public life than had been supposed by the generation which grew up after the death of his father in 1862. Edward VII made the Crown throughout all classes of society a popular power which it had not been in England for long ages. And while the growing rivalry between England and Germany, in international relations, was continually threatening danger, his influence in cementing British friendship on all other sides was of the most marked description. His sudden death was felt, not only throughout the empire but throughout the world, with even more poignant emotion than that of Queen Victoria herself, for his personality had been much more in the forefront.

The end of his reign coincided with a domestic constitutional crisis, to which party politics had been working up more and more acutely for several years. The Tariff Reform propaganda of Mr Chamberlain (q.v.) in 1903 convulsed the Conservative party, and the long period of Unionist domination came to an end in November 1905. Mr Balfour (q.v.), who became prime minister in 1902 on Lord Salisbury's retirement, resigned, and was succeeded by Sir H. Campbell-Bannerman (q.v.), as head of the Liberal party; and the general election of January 1906 resulted in an overwhelming victory for the Liberals and their allies, the Labour party (now a powerful force in politics) and the Irish Nationalists. Just before Sir H. Campbell-Bannerman's death in April 1908 he was succeeded as prime minister by Mr Asquith, a leader of far higher personal ability though with less hold on the affections of his party. The Liberals had long arrears to make up in their political programme, and their supremacy in the House of Commons was an encouragement to assert their views in legislation. In several directions, and notably in administration, they carried their policy into effect; but the House of Lords (see PARLIAMENT) was an obvious stumbling-block to some of their more important Bills, and the Unionist control of that House speedily made itself felt, first in wrecking the Education Bill of 1906, then in throwing out the Licensing Bill of 1908, and finally (see LLOYD GEORGE, D.) in forcing a dissolution by the rejection of the budget of 1909, with its novel proposals for the increased taxation of land and licensed houses. The Unionist party in the country had, meanwhile, been recovering from the Tariff Reform divisions of 1903, and was once more solid under Mr Balfour in favour of its new and imperial policy; but the campaign against the House of Lords started by Mr Lloyd George and the Liberal leaders, who put in the forefront the necessity of obtaining statutory guarantees for the passing into law of measures deliberately adopted by the elected Chamber, resulted in the return of Mr Asquith's government to office at the election of November 1910. The Unionists came back equal in numbers, but the latter could also count on the Labour party and the Irish Nationalists; and the battle was fully arrayed for
a frontal attack on the powers of the Second Chamber when the king’s death in May upset all calculations. This unthought-of complication seemed to act like the letting of blood in an apoplectic patient.

The prince of Wales became king as George V. (q.v.), and a temporary truce was sealed; and then began a dubious, yet unfruitful, attempt between the leaders of the two great parties, by private conference, to see whether compromise was not possible (see PARLIAMENT). Apart from the parliamentary crisis, really hanging on the difficulty of discovering a means by which the real will of the people should be carried out without actually making the House of Commons autocratically omnipotent, but also without allowing the House of Lords to obstruct a Liberal government merely as the organ of the Tory party, the new king succeeded to a noble heritage. The monarchy itself was popular, the country was prosperous and in good relations with the world, except for the increasing naval rivalry with Germany, and the consciousness of imperial solidarity had made extraordinary progress among all the dominions. However the domestic problems in the United Kingdom might be solved, the future of the greatness of the English throne lay with its headship of an empire, loyal to the core, over which the sun never sets.

(H. C.)

XII.—SOURCES AND WRITERS OF ENGLISH HISTORY

The attempt here made to compile a bibliography of English history with some account of the progress of English historical writing is beset with some difficulty. The evidential value of what a writer says is quite distinct from the literary art with which he says it; the real sources of history are not the works of historians, but records and documents written with no desire to further any literary purpose. Domesday Book is unique as a source of medieval history, but it does not count in the development of English historical writing. That is quite a secondary consideration; for there was much English history before any Englishman could write; and even after he could write, his compositions constitute a minor part of the evidence.

Our earliest information about the land and its people is derived from geological, ethnological and archaeological studies, from the remains in British barrows and caves, Roman roads, walls and villas, coins, place-names and inscriptions. The writings of Caesar and Tacitus, and a few scattered notices in other Roman authors, supplement this evidence. But the scientific accuracy of Tacitus’ Germania is not beyond dispute, and that light falls centuries before the Anglo-Saxon conquest of Great Britain. The history of that conquest itself is mainly inferential; there is no complete fabric of Cogent, moral, rather than historical in motive, and written more than a century after the conquest had begun, and the narrative of the Welsh Nennius, who wrote two and a half centuries after Gildas, and makes no critical distinction between the deeds of dragons and those of Anglo-Saxons. The Anglo-Saxons themselves could not write until Christian missionaries had reintroduced the art at the end of the 6th century, and history was not by any means the first purpose to which they applied it. It was first used to compile written statements of customs and dooms which were their nearest approach to law, and these codes and charters are the earliest written materials for Anglo-Saxon history. The remarkable outburst of literary culture in Northumbria during the 7th and 8th centuries produced a real historian in Bede; Bede, however, knows little or nothing of English history between 450 and 596, and he is valuable only for the 7th century onwards of the 8th century reigned (see ANNEEAL ABBEY II). The most useful is the Vita Wulfstati by Eddius, but more valuable are the letters we possess of Boniface and Alcuin. The famous Anglo-Saxon Chronicle was probably started under the influence of Alfred the Great towards the end of the 9th century. Its chronology is often one, two or three years wrong even when it seems to be a contemporary authority, and the value of its evidence on the conquest and the first two centuries after it is very uncertain. But from Egbert’s reign onwards it supplies a good deal of apparently trustworthy information. For Alfred himself we have also Asser’s biography and the Annales of St W白酒t’s, a very imaginative compilation, while most of the stories which have made Alfred’s name a household word are fabulous. Even the Chronicle becomes meagre a few years after Alfred’s death, and its value depends largely upon the ballads which it incorporates; nor is it really supplemented by the lives of St Dunstan, St Dunstan, and the church historians have never treated historical accuracy as a matter of moment; and our knowledge of the last century of Anglo-Saxon history is derived mainly from Anglo-Norman writers who wrote after the Norman Conquest. Some collateral light on the Danish conquest of England is thrown by the Hiimskiringa and other materials collected in Vigiusson and Powell’s Corpus Tostiucum Boraxe, and for the reign of Canute and his sons there is the contemporary Encomium Emmae, which is a dishonest panegyric on the widow of Æthelred and Canute. For Edward the Confessor there is an almost equally biased biography.

For the Norman Conquest itself strictly contemporary evidence is extremely scanty, and historians have exhausted their own and their readers’ patience in disputing the precise significance of some phrases about the battle of Hastings used by Wace, a Norman poet who wrote a century after the battle. The first English version of the Anglo-Saxon Chronicle goes down to 1079 and another to 1154, but their notices of current events are brief and meagre. The Bayeux tapestry affords, however, valuable contemporary evidence, and there are some facts related by eye-witnesses in the works of William of Poitiers and William of Jumièges. A generation of copious chroniclers was, moreover, springing up, and among them were Florence of Worcester, Henry of Huntingdon, Simeon of Durham and William of Malmesbury. Their ambition was almost invariably to write the history of the world, and they generally begin with the Creation. They only become original and contemporary authorities towards the end of their appointed tasks, and the bulk of their work is borrowed from their predecessors. Frequently they embody materials which would otherwise have perished, but their transcription is marred by an amount of conscious or unconscious falsification which seriously impairs their value. All the above-mentioned writers lived in the half-century immediately following the Norman Conquest, but their critical acumen and their literary art vary considerably. William of Malmesbury, Eadmer and Ordericus Vitalis attain a higher historical standard than had yet been reached in England by any one, with the possible exception of Bede. They are not mere annalists; they practise an art and cultivate a style; history has become to them a form of literature. They have this in common with the early thirteenth-century history of the theology, blind to economic influences, and attaching excessive importance to the effects of the individual action of emperors and popes, kings and cardinals. Even their characters are painted in different colours according to their action on quite irrelevant questions, as, for instance, their benefactions to the monastery, to which the historian happens to belong, or to rival houses; and the character once determined by such considerations, history is made to point the morals of their fortunes, or their fate. It is regarded as the record of moral judgments and the proof of orthodox doctrine, and it is long before ecclesiastical historians expel the sermon from their text.

The line of monastic historians stretches out to the close of the middle ages. Most of the great monasteries had their official annalists, who produced such works as the Annals of Tewkesbury, Gloucester, Burton, Waverley, Dunstable, Bermondsey, Osney, by subsequent historians (see ANNEAL ABBEY II). Almost complete volumes in the Rolls series. Some of them are mainly local chronicles; others are almost national histories. In particular, St Albans developed a remarkable school of historians extending over nearly three centuries to the death of Whethamsted in 1465 (see Chronic Monastiri S. Alban, Rolls series, 7 vols., ed. Riley). Only a few of the 235 volumes published under the direction of the master of the Rolls, and called the Rolls series, can here be mentioned. Other medieval writers have been
ENGLISH HISTORY

[AUTHORITIES]

edited for the earlier English Historical Society; some of them have been re-edited without being superseded in the Rolls series. For the reign of Stephen we have the anonymous Gesta Stephani in addition to the writers already mentioned, several of whom continue into Stephen's reign. For Henry II. we have William of Newburgh, who reaches the highest point attainable in recognizing the political composition of the 12th century; the so-called Benedict of Peterborough's Gesta Henrici, which Stubbs tentatively and without sufficient authority ascribed to Richard Fitznigel, Robert of Torigni; and seven volumes of "Materials for the History of Thomas Becket," which contain some of the best and worst samples of hagiological history. For Richard and John the chronicles of Roger of Hoveden, Ralph de Diceto (Dias), Gervase of Canterbury, Ralph of Coggeshall, and a later continuation of Hoveden, known under the name of Walter of Coventry, are the best narrative authorities.

With the accession of Henry III., Roger of Wendover, the first of the St Albans school whose writings are extant, becomes our chief authority. He was re-edited and continued after 1236 by Matthew Paris, the greatest of medieval historians. His work, which goes down to 1259, is picturesque, vivid, and marked by considerable breadth of view and independence of judgment. The most famous part by a series of jejune compilations known as the Flores historiarum (ed. Luard). Besides authorities for Edward I. are Rishanger, Trokelowe and Blaneforde, Wykes, Walter of Hemingburgh, Nicholas Tretvet, Oxnead and Bartholomew Cotton, and others contained in Stubbs's Chronicles of Edward I. and Edward II. In the 14th century there is a significant deterioration in the monastic chronicles, and their place is taken by the works of secular clergy like Adam Murimuth, Geoffrey the Baker, Robert of Avesbury, Henry Knighton and the anonymous author of the Eulogium historiarum. Monastic history is represented by Higden's voluminous Polychronicon, which succeeds the Flores historiarum. A brief revival of the St Albans school towards the end of the century is seen in the Chronicon Angliae and the works of T. Walsingham, which continue into the reign of Henry V. For Richard II. we have also Malverne and the Monk of Eveham; for the early Lancastrians, Capgrave, Elmham, Otterbourne, Adam of Usk; and for Henry VI., Amundesham, Whethamstede, William of Worcester and John Hardeng, as well as a number of anonymous brief chroniclers, edited, though not in the Rolls series, by J. Gairdner, C. L. Kingsford, N. H. Nicolas and J. S. Davies.

These are the principal English historical writers for the middle ages; but as the connexion between England and the continent grew closer, and international relations developed, an increasing amount of light is thrown on English history by foreign writers. Of those authorities one of the earliest is the Histoire des ducs de Normandie et des rois d'Angleterre (ed. Michel); briefer are the Chronique de l'Anonyme de Bithune and the Histoire de Guillaume le Martel. A large number of French and Flemish chronicles illustrate the history of the Hundred Years' War, by far the most important being Froissart (best edition by Luce, though Lettenhove's is bigger). Next come Jehan le Bel, Waurin's Recueil, Monstrelet, Chastellain, Juvenal des Ursins, and more limited works such as Créton's Chronique de la traison et mort de Richard II.

Chronicles, however, grow less important as sources of history as time goes on. Their value is always dependent upon the absence of the more satisfactory materials known as records, and these records gradually become more copious and complete. They develop with the government, of whose activity and policy they are the real test and evidence. Perhaps the most important thing in history is the evolution of government, the development of consciousness; a will on the part of the state. This will is expressed in records; and, as the state progresses from infancy through the stage of tutelage under the church to its modern "omnicompetence," so its will is expressed in an ever widening and differentiating series of records. The first need of a government is finance; the earliest organized machinery for exerting its will is the exchequer; and the earliest great record in English history is Domesday Book. It is followed by a series of exchequer records, called the Pipe Rolls, which begin in the reign of Henry I., and dating from that of Henry II. is the Dialogus de scaccario, which explains in none too lucid language the intricate working of the exchequer system. It was Henry II. who gave the greatest impetus to the development of the machinery for expressing the will of the state. He began with finance and went on to military and judicial administration. The first collection of charters, the administration of justice was a great source of revenue. So national courts of law are added to the national exchequer, and by the end of the 12th century legal records become an even more important source of history than financial documents. The judicial system is described by Glanvill at the end of the 12th, and by Bracton and Fleta in the 13th century (for the exchequer see the Testa de Nevill and the Red Book of the Exchequer). During that period the Curia Rotulorum, three offshoots—the courts of exchequer, king's bench and common pleas; and records of their judicial proceedings survive in the Plea Rolls and Year Books, some of which have been edited for the Rolls series, the Selden and other societies. Numerous other classes of legal and administrative records gradually develop, the Patent and Close Rolls (first calendared by the Record Commission, and subsequently treated more adequately under the direction of the deputy keeper of the Records), Charters (here we have first grants, then to individual holders, then to collective groups, monasteries or boroughs, then to classes, and finally expanded—as in Magna Carta—into grants to the whole nation), Escheats, Feet of Fines, Inquisitions post mortem, Inquisitions ad quod damnum, Placita de quo Warranto, and others for which the reader is referred to S. R. Scargill-Bird's Guide to the Principal Classes of Documents preserved in the Record Office (3rd ed., 1906).

Every branch of administration comes to be represented in records almost as soon as it is developed. The evolution of the army which won Crecy and Poitiers is accompanied by the accumulation of a mass of indentures and other military documents, the value of which has been illustrated in Dr Morris's Welsh Wars of Edward I. and George Wrottesley's Cre cy and Calais from the Public Records. The growth of naval organization is reflected in the Black Book of the Admiralty; the growth of taxation in the Liber custumarium and Subsidy Rolls; the rise of parliament in the Parliamentary Writs (ed. Palgrave), in the Rotuli parliamentarii, in the Official Return of Members of Parliament, and in the Statutes of the Realm; that of Convocation in David Wilkin's Concilia. The register of the privy council does not begin until later in the 14th century, and then is broken off between the middle of the 15th and 1350.

Local as well as central government begets records as it grows. From the Extentia manorii of the 12th century we get to the Houblon Rolls of the 13th, when also we have the Hundred Rolls, records of forest courts, of courts leet and of coroners' courts, and a variety of municipal documents, for which the reader is referred to Dr C. Gross's Bibliography of British Municipal History and to Mrs J. R. Green's more popular Town Life in the Fifteenth Century. The municipal records of London, its husting court and city companies, are too multifarious to describe; some classes of these documents have been exemplified in the works of Dr R. R. Sharpe. Ecclesiastical records are represented by the episcopal registers (for the most part still unpublished), monastic cartularies, and other documents rendered comparatively scarce by the spoliation of the monasteries, and scattered proceedings of ecclesiastical courts. (See also the article RECORD.)

Documents, other than records strictly so called, begin to grow with the habit of correspondence and the necessity of communication. A few letters survive from the time of the Norman kings, but the earliest collection of letters of the state is the Letters of Henry III. (Rolls series). Contemporary are the Letters of Grosseteste, and a little later come the Letters of Archbishop Peckham and Rainis's Letters from Northern Registrars (all in the Rolls series). Private correspondence appeared earlier in the voluminous epistles of Peter of Blois, archdeacon of Bath (ed. Giles). This is a somewhat intermittent source of history until we come to the 15th century, when the well-known Paston
ENGLISH HISTORY

Letters (ed. Gairdner) begin a stream which never fails thereafter and soon becomes a torrent. The most important series of official correspondence is the Papal Letters, calendared from 1198 to 1404 in 4 vols. (ed. Bliss, Johnson and Twemlow). Subsidiary sources are the Political Songs (ed. Wright), treatises like those of John of Salisbury, Gerald of Wales, and, later, Wycliffe's works, Netter's Fasciculi Zizaniorum, Gascogne's Lois et libres verticaux, and an autobiography, and literary writings of Chaucer, Langland, Gower, Richard Rolle and others.

During the 15th century the transition, which marks the change from medieval to modern history, affects also the character of historical sources and historical writing. In the first place, history ceases to be the exclusive province of the church; monastic chronicles shrink to a trickle and then dry up; the last of their kind in England is the Grevyns Chronicle (Camden Society), which ends in 1554. Their place is taken by the city chronicle compiled by middle-class laymen, just as the Renaissance was not a revival of clerical learning, but the expression of new intellectual demands on the part of the laity. Secondly, the definite disappearance of the medieval ideas of a cosmopolitan world and the emergence of national states begat diplomacy, and with it an ever swelling mass of diplomatic material. Diplomacy had hitherto been occasional and intermittent, and embassies rare; now we get resident ambassadors carrying on a regular correspondence (see Diplomacy). Hence, when Venice and later Venice made it the pioneer in this direction, though its representatives abroad were at first commercial rather than diplomatic agents. The Calendar of Venetian State Papers goes back to the 14th century, but does not become copious till the reign of Henry VII, when also the Spanish Calendar begins. Resident French ambassadors in England only begin in the 16th century, and later still those from the emperor, the German and Italian states other than Venice. In the third place, the development of the new monarchy involved an enormous extension of the activity of the central government, and therefore a corresponding expansion in the records of its energy.

The political records of this energy are the State Papers, a class of document which soon dwarfs all others, and renders chroniclers, historians and the like almost negligible quantities as sources of history; but in another way their value is enhanced, for these hundreds of thousands of documents provide a test of the accuracy of modern historians which is imperfect in the case of medieval chroniclers and almost non-existent in that of ancient writers. These state papers are either "foreign" or "domestic," that is to say, the correspondence of the English government with its agents abroad, or at home. There is also the correspondence of foreign ambassadors resident in England with their governments. This last class of documents exists in England mainly in the form of transcripts from the originals in foreign archives, which have been made for the purpose of the Venetian and Spanish Calendar of state papers. The Venetian Calendar had by 1900 been carried well into the 17th century; the Spanish (which includes transcripts from the Habsburg archives at Vienna, Brussels and Simancas) covered only the reigns of Henry VII and VIII. and Queen Elizabeth. No attempt had yet been made to calendar the French correspondence in a similar way, though the French Foreign Office published some fragmentary collections, such as the Correspondance de M.M. de Castillon et de Marillac and that of Odet de Sevel. There are other collections too numerous to enumerate, such as Lettenhove's edition of Philip II's correspondence relating to the Netherlands, Diegerick and Müller's, Teulet's and Alberi's collections, the French Documents intitulés et the Spanish Documentos ineditos, all containing state papers relating to England's foreign policy in the 17th century. The Scottish and Irish state papers are calendared in separate series and without much correspondence (see Scottish Administration, and the Border Papers, the Dalinton Papers, Thorp's Calendar, and more recent and complete, Bain's Calendar. For Ireland, besides the regular Irish state papers, there are the Carew Papers, almost as important. Anarchy, indeed, pervades the whole method of publication. For the reign of Henry VII. we have, besides the Venetian and Spanish Calendars, only three volumes—Gairdner's Letters and Papers of Richard III. and Henry VIII. and Campbell's Materials (2 vols., Rolls series). Then with the reign of Henry VIII. begins the magnificent and monumental Letters and Papers of Henry VIII., the one modern series for which the Record Office deserves unstinted praise. This is not limited to state papers, domestic and foreign, nor to documents in the official hands of the Record Office; it includes private letters and literary writings of Chaucer, Langland, Gower, Richard Rolle and others.

After 1547 a different plan is adopted, though not consistently followed. Only state papers are calendared, and as a rule only those in the Record Office; and the domestic are separated from the foreign. The great fault is the neglect of the vast quantities of state papers in the British Museum. The Domestic Calendar (the first volume of which is very inadequate) extended in 1900 in a series of more than seventy volumes nearly to the end of the 17th century; the mass of MSS. calendared therein may be gathered from the fact that for the reign of Elizabeth the Domestic state papers fill over three hundred and forty volumes. The Venetian Calendar had only got to 1583, but it occupied sixteen printed volumes against one of the Domestic Calendar. For the masses of MSS. uncalendared in the British Museum there is no guide except the imperfect indexes to the Cotton, Harleian, Lansdowne, Additional and other collections. Hardly less important than the calendars are the reports of the Historical Manuscripts Commission and the appendices thereto, which extend to over a hundred volumes; twelve are occupied by Lord Salisbury's 19th-century MSS. at Hatfield House. The dispersed state papers is due to the fact that they were in those days treated not as the property of the state, but as the private property of individual secretaries.

State papers represent only one side of the activity of the central government. The register of the privy council, extending with some lacunae from 1539 to 1604, has been printed in thirty-two volumes. The Rotuli parliamentorum end with Henry VII, but in 1590 begin the journals of the House of Lords, and in 1547 the journals of the House of Commons. These are supplemented by private diaries of members of parliament, several of which were used in D'Ewes's Journals. Legal history can now be followed in a continuous series of law reports, beginning with Kellway, Staunford and Dyer, and going on with Coke and many others; documentary records of various courts are exemplified in the Select Cases from the star chamber, the court of requests and admiralty courts, published by the Selden Society; and there are voluminous records of the courts of augmentations, first-fruits, wards and liveries in the Record Office. For Ireland, besides the state papers, there are the Calendars of Patents and of Fiants, and for Scotland the Exchequer Rolls and Registers of the Privy Council and of the Great Seal, both extending to many volumes. Unofficial sources multiply with equal rapidity, but it is impossible to enumerate the collections of private letters, &c., only a few of which have been published. The chronicles, which in the 15th century are usually meagre productions like Warkworth's (Camden Society), get fuller, especially those emanating from London. Fabian is succeeded by Hall, an indispensable authority for Henry VIII., and Hall by Grafton. Other useful books are Wriothesley's Chronicle and Machyn's Diary, and they have numerous successors; some of their works have been edited for the Camden Society, which now takes the place of the Rolls series. The most important are Holinshed, Raw and Camden; and gradually, with Speed and Bacon, the chronicle develops into the history, and early in the 17th century we get such works as Lord Herbert's Reign of Henry VIII., Hayward's Edward VI., and, on the ecclesiastical side, Heylyn, Fuller, Burnet and Collier's histories of the church and...
Reformation. Foxe, who died in 1587, included a vast and generally accurate collection of documents in his Acts and Monuments, popularized as the Book of Martyrs, though his own contributions have to be discounted as much as those of Sanders, Parsons and other Roman Catholic controversialists. Two other great collections are the Parker Society's publications (56 vols.), which contain besides the works of the reformers a considerable number of letters, and Sutcliffe's works (16 vols.). The naval epic of the period is Hakluyt's Voyages, re-edited in 12 vols. in 1902, and continued in Purchas's Pilgrims.

In the 17th century the domestic and foreign state papers eclipse other sources almost more completely than in the 16th. The colonial state papers now become important and extensive, those relating to America and the West Indies being most numerous (18 vols. to 1700). Parliamentary records naturally expand, and the journals of both houses become more detailed. Parliamentary diarists like D'Ewes, Burton and Walter Yonge, only a fragment of whose shorthand notes in the British Museum has been published (Camer Society), elucidate the bare official statements; and from 1660 the series of parliamentary debates is fairly complete, though not so full or authoritative as it becomes with Hansard in the 19th century. Social diaries of great value appear after the Restoration in Pepys, Evelyn, Reynolds, Luttrell and Swift (Journal to Stella), and political writing grows more important, whether it takes the form of Bacon's (ed. Speeding) or Milton's treatises, or of satires like Dryden's and political pamphlets like Halifax's and then Swift's, Defoe's and Steele's. Clarendon's Great Rebellion and Burnet's History of My Own Time are the first modern attempts at contemporary history, as distinct from chronicles and annals, in England, although it is difficult to exclude the work of Matthew Paris from the category. The innumerable tracts and newsletters are a valuable source for the Civil Wars and Commonwealth period (see J. B. Williams, A History of English Journalism, 1909), while Thurloe's, Clarendon's and Nelson's collections of state papers deserve a mention apart from the Domestic Calendar. There is a still more monumental collection—the Carte Papers—on Irish affairs in the Bodleian Library, where also the Tanner MSS. and other collections have only been very partially worked. The volumes of the Historical MSS. Commission are of great value for the later Stuart period, notably the House of Lords MSS.

For the 18th century the only calendars are the Home Office Papers and the Treasury Books and Papers, the further specialization of government having made it necessary to differentiate domestic state papers into several classes. But it need hardly be said that the bulk of correspondence in the Record Office does not diminish. Outside its walls the most important single collection is perhaps the duke of Newcastle's papers among the Additional MSS. of the History of the House of Lords, and the Court of Session, and the Duke of Buckingham's Court and Cabinets of George III. The correspondence in The Memoirs of Rockingham, and the duke of Buckingham's Court and Cabinets of George III. and Lord North's (ed. in Lord Acton), and Rose's Correspondence and Lord Colchester's Correspondence. Of special interest is the series of naval records, despatches to and from naval commanders, proceedings of courts-martial, and logs in the Record Office which have never been properly utilized.

Among unofficial sources the most characteristic of the 18th century are letters, memoirs and periodical literature. Harloe Walpole's Letters (Clarendon Press, 16 vols.) are the best comment on the history of the period; his Memoirs are not so good, though they are superior to Wraezall, who succeeds him. Periodical literature becomes regular in the reign of Queen Anne, chiefly in the form of journals like the Spectator; but several daily newspapers, including The Times, were founded during the century. The Craftsman provided a vehicle for Bolingbroke's attacks on Walpole, while the Gentleman's Magazine and Annual Register begin a more serious and prolonged career. Both contain occasional state papers, and not very trustworthy reports of parliamentary proceedings. The publication of debates was not authorized till the last quarter of the century; parliamentary papers begin earlier, but only slowly attain their present proportions.

Political writing is at its best from Halifax to Cobbett, and its three greatest names are perhaps Swift, "Junius" and Burke, though Steele, Defoe, Bolingbroke and Dr Johnson are not far behind, while Canning's contributions to the Anti-Jacobin and Gillray's caricatures require mention.

The sources for 19th-century history are somewhat similar to those for the 18th. Diaries continue in the Creevy Papers, Greville's Diary, and lesser but not less voluminous writers like Sir M. E. Grant-Duff. The most important series of letters is Queen Victoria's (ed. Lord Esher and A. C. Benson, 1908), and the correspondence of most of her prime ministers and many of her other advisers has been partially published. Of political biographies there is no end. The great bulk of material, however, consists of blue-books, Hansard's Parliamentary Debates, and newspapers—which are better as indirect than direct evidence. The real truth is not of course revealed at once, and many episodes in recent political history serve as a source of information in this respect English governments are more cautious or reactionary than many of those on the continent of Europe, and access to official documents is denied when it is granted elsewhere; even the lapse of a century is not considered a sufficient salve for susceptibilities which might be wounded by the whole truth.

Meanwhile the 19th century witnessed a great development in historical writing. In the middle ages the stimulus to write was mainly of a moral or ecclesiastical nature, though the patriotic impulse which had suggested the Anglo-Saxon Chronicle was perhaps never entirely absent, and the ecclesiastical motive often degenerated into a desire to glorify, sometimes even by forgery, not merely the church as a whole, but the particular monastery to which the writer belonged. As nationalism developed, the patriotic motive supplanted the ecclesiastical, and stress is laid on the "famous" history of England. Insular self-glorification was, however, modified to some extent by the Renaissance, which developed an interest in other lands, and the Reformation, which gave to much historical writing a partisan theological bias. This still colours most of the "histories" of the Reformation period, because the issues of that time are living issues, and the writers of these histories are committed beforehand by their profession and their position to a particular interpretation. In the 17th century political partisanship coloured historical writing, and that, too, remained a potent influence as long as history was treated as the "History of the Great Men of the Past". Insular Historians were often elaborate party pamphlets, and this race of historians is hardly yet extinct. Macaulay is not greatly superior in impartiality to Hume; Gibbon and Robertson were less open to temptation because they avoided English subjects. Hallam deliberately aimed at impartiality, but he could not escape his Whig atmosphere. Nevertheless, the effort to be impartial marks a new conception of history, which is well brought out in the British and French Historical Works of the 18th and 19th centuries; the "Cambridge Modern History" series is a further development. Historians are to serve no cause but that of truth; in so far even as they desire a line of investigation to lead to a particular result, they are not, maintains Professor Bury, real historians. S. R. Gardiner perhaps attained most nearly this severe ideal among English historians, and Ranke among Germans. But, even when all conscious bias is eliminated, the unconscious bias remains, and Ranke's history of the Reformation is essentially a middle-class, even bourgeois, presentation. Stubbs's medievalist sympathies colour his history throughout, and still more strongly does Froude's anti-clericalism. Freeman's bias was peculiar; he is really a West Saxon of Godwine's time reincarnated, and his Somerset hatred of French, Scots and Mercian foreigners sets off his robust loyalty to the house of Wessex. Lecky and Creighton are almost
as dispassionate as Gardiner, but are more definitely committed to particular points of view, while democratic fervour pervades the fascinating pages of J. R. Green, and an intellectual secularism, which is almost religious in its intensity and idealism, inspired the genius of Maitland.

The latest controversy about history is whether it is a science or an art. It is, of course, both, simply because there must be science in every art and art in every science. The antithesis is largely false; science lays stress on analysis, art on synthesis. The most serious criticism of Green is that he has not mastered the methods to his art results; he must test his documents and then turn them into literature. The relative importance of the two methods is a matter of dispute. There are some who still maintain that history is merely an art, that the best history is the story that is best told, and that what is said is less important than the way in which it is said. This school generally ignores records. Others attach little importance to the form in which truth is presented; they are concerned mainly with the principles and methods of scientific criticism, and specialize in palaeography, diplomatic and sources. The works of this school are little read, but in time its results penetrate the teaching in schools and universities, and then the pages of literary historians; it is represented in England by a fairly good organization, the Royal Historical Society (with which the Cambridge Society has been amalgamated), and by an excellent periodical, The English Historical Review (founded in 1884), while some sort of propaganda has been attempted by the Historical Association (founded in 1906). Its standards have also been upheld with varying success in great co-operative undertakings, such as the Dictionary of National Biography, the Cambridge Modern History, and Messrs. Longmans' Political History of England.

These 19th-century products require some sort of classification for their place in historical science, and the classification is the most convenient. Lingard's J. R. Green's and Messrs. Longmans' histories are the only notable attempts to tell the history of England as a whole, and in a comprehensive manner (3 vols. complete). In the middle ages and embodies a political survey as well (for corrections and modifications see Petit-Dutaillis, Supplementaries Studies, 1908), while Hallam's Constitutional History (3 vols.) extends from 1485 to 1760 and Enskine May's (3 vols.) from 1760 to 1860. Sir James Ramsay's six volumes also cover the greater part of medieval English history. There is no work on a larger scale than Lappenburg and Kemble, dealing with England before the Norman Conquest, though J. R. Green's Making of England and Conquest of England deal with certain periods in some detail, and Freeman gives a preliminary survey in his Norman Conquest (6 vols.). For the succeeding period see Freeman's William Rufus, J. H. Round's Feudal England and Geoffrey de Mandeville, and Miss Norgate's England under the Anglos and John Lackland. From 1216 we have nothing of the same interest, Stubbs, Longmans' Political History in monographs (some of them good), until we come to Wylie's Henry IV (4 vols.) and again from 1413 the same is true (Gairdner's Lollardy and the English State monograph) and it is only at the evidence of the Breve's Reign of Henry VIII (2 vols.; to 1530 only), Froude's History (12 vols., 1529-1588) and R. W. Dixon's Church History (6 vols.; 1596-1790). From 1660 to 1696 we have Gardiner's History (England, 10 vols.; Civil War, 4 vols.; Commonwealth and Protectorate, 3 vols.), and to 1714 Ranke's History of England (6 vols.; see also Firth's Cromwell and Cromwell's Army, and various editions of texts and monographs). For Charles II. the principal history; then come Macaulay, and Stanhope and Wyon's Queen Anne, and for the 18th century Stanhope and Lecky (England, 7 vols.; Ireland, 5 vols.). From 1763 to 1815 is another period, with partially filled. Spencer Walpole deals with the period from 1815 to 1880, and Herbert Paul with the years 1846-1895.

A few books on special subjects deserve mention. For legal history, Liddell's A History of English Law (2 vols.; to Edward I.), Maitland's Domestacy and Beyond, and Anson's Law and Custum of the Constitution; for economic history, Cunning- hall's, Lowndes and Grieve, and Ashley and Ashley's History; for ecclesiastical history, Stephens and Hunt's series (7 vols.); for foreign and colonial, Sibree's English Foreign Policy and Europe, and J. G. Williamson's books on the American colonies; for military history, Fortescue's History of the British Army, Napier's and Omen's works on the Spanish War, and Kinglake's Isinulon of the Crises; and for naval history, Corbett's Drums and Guns, Success in the Siam, and South African War, and Mahan's Influence of Sea Power on History and Influence of Sea-Power upon the French Revolu- tion. (See Bibliography of Bibliographies.)—The sources for the middle ages have been enumerated in C. Gough's Sources and Literature of English History to about 1485 (London, 1900), but there is nothing similar for modern history. G. C. Lee's Source Book of English History is not very satisfactory. More information can be found in the bibliographies edited by G. C. Lee, Frederic W. M. Longmans' Political History, or the chapters in the Cambridge Modern History, or to the bibliographical articles in the D.N.B. and Enyc. Brit. A series of bibliobographical leaflets for the use of teachers is furnished by the Historical Association, through its Editor, J. A. Scargill-Bird's Guide to the Record Office, and the class catalogues in the MSS. Department of the British Museum. Lists of the state papers and other documents are appended in the direction of the master of the Rolls and deputy keeper of the Records are supplied at the end of many of their volumes.

ENGLISH LANGUAGE

In its historical sense, the name English is now conveniently used to comprehend the language of the English people from their settlement in Britain to the present day; the various stages through which it has passed being distinguished as Old, Middle, and New or Modern English. In works yet recent, and even in some still current, the term is confined to the third, or at most extended to the second and third of these stages, since the language assumed in the main the vocabulary and grammatical forms which it now presents, the oldest or inflected stage being treated as a separate language, under the title of Anglo-Saxon, while the transition period which connects the two has been called Semi-Saxon. This view had the justification that, looked upon by themselves, either as products of thought or as objects of study and analysis, Old English or Anglo-Saxon language and dialects were understood in their local ends, distinct languages,—as much so, for example, as Latin and Spanish. No amount of familiarity with Modern English, including its local dialects, would enable the student to read Anglo-Saxon, three-fourths of the vocabulary of which have perished and been reconstructed within 900 years; nor would a knowledge even of these lost words give him the power, since the grammatical system, alike in accidence and syntax, would be entirely strange to him. Indeed, it is probable that a modern Englishman would acquire the power of reading and writing French in less time than it would cost him to attain to the same proficiency in Old English; so that if the test of distinct languages be their degree of practical difference from each other, it cannot be denied that "Anglo-Saxon" is a distinct language from Modern English. But when we view the subject historically, recognizing the fact that living speech is subject to continuous change in certain definite directions, determined by the constitution and circumstances of mankind, and the development of which we can trace the steps, and that, owing to the abundance of written materials, this evolution appears so gradual in English that we can nowhere draw distinct lines separating its successive stages, we recognize these stages as merely temporary phases of an individual whole, and speak of the English language as used alike by Cyanwulf, by Chaucer, by Shakespeare and by Tennyson. It must not be forgotten, however, that in this wide sense the English language includes not only the literary or courtly forms of speech used at successive periods, but also the popular and, it may be, altogether unwritten dialects that exist by their side. Only on this basis, indeed, can we speak of Old, Middle and Modern English as the same language, since in actual fact the precise dialect which is now the cultivated language, or "Standard English," is not the descendant of that dialect which was the cultivated language or "English" of Alfred, but of a sister dialect then sunk in comparative obscurity,—even as the direct descendant of Alfred's English is now to be found in the non-literary rustic speech of Wiltshire and Somersetshire. Causes which, linguistically

1 A careful examination of several letters of Bosworth's Anglo-Saxon dictionary gives in 2000 words (including derivatives and compounds, but excluding orthographic variants) 553 which still stand.

2 The practical convenience of having one name for what was the same thing in various stages of development is not affected by the probability that (E. A. Freeman notwithstanding) all those stages were, at an early period, not applied to the whole of the inhabitants of Teutonic Britain, but only to a part of them. The dialects of English which were alike in terms of which was afterwards English speech, and so, viewed in relation to it, Old English, whatever their contemporary names might be.
ENGLISH LANGUAGE

considered, are external and accidental, have shifted the political and intellectual centre of England, and along with it transferred literary and official patronage from one form of English to another; if the centre of influence had happened to be fixed at York or on the banks of the Forth, both would probably have been neglected for a third.

The English language, thus defined, is not "native" to Britain, that is, it was not found there at the dawn of history, but was introduced by foreign immigrants at a date many centuries later. At the Roman Conquest of the island the language spoken by the natives belonged all (so far as is known) to the Celtic branch of the Indo-European or Indo-Germanic family, modern forms of which still survive in Wales, Ireland, the Scottish Highlands, Isle of Man and Brittany, while one has at no distant date become extinct in Cornwall (see Celt: Language). Brythonic dialects, allied to Welsh and Cornish, were apparently spoken over the greater part of Britain, as far north as the firths of Firth and Clyde; beyond these estuaries and in the isles to the west, including Ireland and Man, Goidelic dialects, akin to Irish and Scottish Gaeic, prevailed. The long occupation of south Britain by the Romans (A.D. 43-409)—a period, it must not be forgotten, equal to that from the Reformation to the present day, or nearly as long as the whole duration of modern English—familiarized the provincial inhabitants with Latin, which was probably the ordinary speech of the towns. Gildas, writing nearly a century and a half after the renunciation of the Roman power, addressed his epistles to the British princes in that language; and the linguistic history of Britain might have been not different from that of Gaul, Spain and the other provinces of the Western Empire, in which a local type of Latin, giving birth to a neo-Latinic language, finally superseded the native tongue except in remote and mountainous districts, had not the course of events been entirely changed by the Teutonic conquests of the 5th and 6th centuries.

The Angles, Saxons, and their allies came of the Teutonic stock, and spoke a tongue belonging to the Teutonic or Germanic branch of the Indo-Germanic (Indo-European) family, the same race and form of speech being represented in modern times by the people and languages of Holland, Germany, Denmark, the Scandinavian peninsula and Iceland, as well as by those of England and her colonies. Of the original home of the so-called primitive Aryan race (q.v.), whose language was the parent Indo-European, nothing is certainly known, though the subject has given birth to many conjectures: the present tendency is to seek it in Europe itself. The tribe can hardly have occupied an extensive area at first, but its language came by degrees to be diffused over the greater part of Europe and some portion of Asia. Among those whose Aryan descent is generally recognized as beyond dispute are the Teutons, to whom the Angles and Saxons belonged.

The Teutonic or Germanic people, after dwelling together in a body, appear to have scattered in various directions, their language gradually breaking up into three main groups, which can be already clearly distinguished in the 4th century A.D., North Germanic or Scandinavian, West Germanic or Low and High German, and East Germanic, of which the only important representative is Gothic. Gothic, often called Moeso-Gothic, was the language of a people of the Teutonic stock, who, passing down the Danube, invaded the borders of the Empire, and obtained settlements in the province of Moesia, where their language was committed to writing in the 4th century; its literary remains are of peculiar value as the oldest specimens, by several centuries, of Germanic speech. The dialects of the invaders of Britain belonged to the West Germanic branch, and within this to the Low German group, represented at the present day by Dutch, Frisian, and the various "Platt-Deutsch" dialects of North Germany. At the dawn of history the forefathers of the English appear to have been dwelling between and about the estuaries and lower courses of the Rhine and the Weser, and the adjacent coasts and isles; at the present day the most English or Angli-form dialects of the European continent are held to be those of the North Frisian islands of Amrum and Sylt, on the west coast of Schleswig. It is well known that the greater part of the ancient Friesland has been swept away by the encroachments of the North Sea, and the district called the Frisian race, pressed by the sea in front and various powerful nationalities behind, are found only in isolated fragments from the Zuider Zee to the coasts of Denmark. Many Frisians accompanied the Angles and Saxons to Britain, and Old English was in many respects more closely connected with Old Frisian than with any other Low German dialect. Of the Geatas, Eotras or "Jutes," who, according to Bede, occupied Kent and the Isle of Wight, and formed a third tribe along with the Angles and Saxons, it is difficult to speak linguistically. The speech of Kent certainly formed a distinct dialect in both the Old English and the Middle English periods, but it has tended to assimilate more and more to neighbouring southern dialects, and is at the present day identical with that of Sussex, one of the old Saxon kingdoms. Whether the speech of the Isle of Wight ever showed the same characteristic differences as that of Kent cannot now be ascertained, but its modern dialect differs in no respect from that of the southern English counties of Hampshire and Sussex. It is at least entirely doubtful whether Bede's Geatas came from Jutland; on linguistic grounds we should expect that they occupied a district lying not to the north of the Angles, but between these and the old Saxons.

The earliest specimens of the language of the Germanic invaders of Britain that exist point to three well-marked dialect groups: the Anglian (in which a further distinction may be made between the Northumbrian and the Mercian, or Southumbrian); the Saxen, generally called West-Saxon from the almost total lack of sources outside the West-Saxon domain; and the Kentish. The Kentish and West-Saxon are sometimes, especially in later times, grouped together as southern dialects as opposed to midland and northern. These three groups were distinguished from each other by characteristic points of phonology and inflection. Speaking generally, the Anglian dialects may be distinguished by the absence of certain normal West-Saxon changes, and the presence of others not found in West-Saxon, and also by a strong tendency to confuse and simplify inflections, in all which points, moreover, Northumbrian tended to deviate more widely than Mercian. Kentish, on the other hand, occupied a position intermediate between Anglian and West-Saxon, early Kentish approaching more nearly to Mercian, owing perhaps to early historical connexion between the two, and late Kentish tending to conform to West-Saxon characteristics, while retaining several points in common with Anglian. Though we cannot be certain that these dialectal divergences date from a period previous to the occupation of Britain, such evidence as can be deduced points to the existence of differences already on the continent, the three dialects corresponding in all likelihood to Bede's three tribes, the Angles, Saxons and Geatas.

As it was amongst the Angli or Angles of Northumbria that literary culture first appeared, and as an Anglo-English dialect was the first to be used for vernacular literature, English came eventually to be a general name for all forms of the vernacular as opposed to Latin, &c.; and even when the West-Saxon of Alfred became in its turn the literary or classical form of speech, it was still called English or English. The origin of the name Anglo-Saxon (Anglo-Saxons) has been disputed, some maintaining that it means a union of Angles and Saxons, others (with better foundation) that it meant English Saxons, or Saxons of England of the Angel-cynn as distinguished from Saxons of the Continent (see New English Dictionary, i.e.). Its modern use is mainly due to the little band of scholars who in the 16th and 17th centuries turned their attention to the long-forgotten language of Alfred and Ælfric, which, as it differed so greatly from

1 The works of Gildas in the original Latin were edited by Mr. Stevenson for the English Historical Society. There is an English translation in Six Old English Chronicles in Bohn's Antiquarian Library.

2 As to the continued existence of Latin in Britain, see further in Rhy's Lectures on Welsh Philology, pp. 226-227; also Dogatschar, Lganzkunde d. gr., lat. u. roman. Lehnworte im Allengli. (Strasburg, 1888).
the English of their own day, they found it convenient to distin-
guish by a name which was applied to themselves by those who
spoke it. To these scholars "Anglo-Saxon" and "English" were
separated by a gulf which it was reserved for later scholar-
ship to bridge across, and show the historical continuity of the
English of others.

As already hinted, the English language, in the wide sense,
presents three main stages of development—Old, Middle and
Modern—distinguished by their inflectional characteristics.
The latter can be best summarized in the words of Dr Henry
Sweet in his History of English Sounds: "Old English is the peri-
fold of full inflections (náma, géfan, cæn), Middle English of
lenèled inflections (námen, gêven, cæere), and Modern English of
lost inflections (náme, gêve, cæn = námen, gîve, cîð). We have besides
two periods of transition, one in which námen and náme exist side
by side, and another in which final e [with other endings] is
beginning to drop." By lost inflections it is meant that only very
few remain, and those mostly non-syllabic, as the ñ in stones and
loves, the ñ in loved, the r in their, as contrasted with the Old
English stân-as, lufñ, luf-ér-ð and luf-ð-on, þa-rs. Each of these
periods may also be divided into two or three; but from the
material of these it is difficult to make any such division all
the more so in the first.

As to the chronology of the successive stages, it is of course
impossible to lay down any exclusive series of dates, since the
linguistic changes were inevitably gradual, and also made them-
selves felt in some parts of the country much earlier than in others,
the north being always in advance of the midland, and the south
much later in its changes. It is easy to point to periods at which
Old, Middle and Modern English were fully developed, but much
less easy to draw lines separating these stages, and even if we recog-
ize between each part a "transition" period or stage, the
determination of the beginning and end of this will to a certain
extent be a matter of opinion. But bearing these considerations
in mind, and having special reference to the midland dialect
from which literary English is mainly descended, the following
may be given as approximate dates, which if they do not
demarcate the successive stages, at least include them:

<table>

Dr Sweet has reckoned Transition Old English (Old Transition)
from 1050 to 1150, Middle English thence to 1450, and Late or
Transition Middle English (Middle Transition) 1450 to 1500.
As his division see further below.

The Old English or Anglo-Saxon tongue, as introduced
into Britain, was highly inflectional, though its inflections at the date
when it became known to us were not so full as those of the
earlier Gothic, and considerably less so than those of Greek
and Latin during their classical periods. They corresponded more
closely to those of modern literary German, though both in
nouns and verbs the forms were more numerous and distinct;
for example, the German guotes answers to three Old English
forms—gððne, gððnum, gððam; guoter to two—gððne, gððra;
liðten to two—lufðen and lufðen. Nouns had four cases,
Nominaive, Accusative (only sometimes distinct), Genitive,

1 Athelstan in 934 calls himself in a charter "Ongol-Saxna cyning
and Bryantenwaldall carne theyes ielandes"; Eadred in 955 is
"Angul-seaxna cyning and cæsere totius Britanniae," and the name
is of frequent occurrence in documents written in Latin. These facts
ought to be remembered in the interest of the scholars of the 17th
century, who have been blamed for the use of the term Anglo-Saxon,
if the other hand, when we are treating it historically or in com-
nexion with English as a whole.

2 Transactions of the Philological Society (1873-1874), p. 650;

Dative, the latter used also with prepositions to express locative,
instrumental, and most ablative relations; of a distinct instru-
mental case only vestiges occur. There were several declensions
of nouns, the main division being that known in Germanic languages
generally as strong and weak,—a distinction also extending to
adjectives in such wise that every adjective assumed either the
strong or the weak influence as determined by associated gram-
matical forms. The first and second personal pronouns possessed
a dual number—we two, ye two; the third person had a complete
decletion of the stem he, instead of being made up as now of the three
stems seen in he, she, they. The verb distinguished the
subjective from the indicative mood, but had only two inflected
tenses, present and past (more accurately, that of incomplete
and that of completed or perfect action)—the former also used
for the future, the latter for the whole series of past time. The order
of the sentence corresponded generally to that of German.

Thus from King Alfred's additions to his translation of Orosius:
"Donne þy ylcian dege he hinge þæm deber wylía þonne
todeal þi his feo þæter to lafe biñ after þæm gedrynce and
þæm plegen, on þif 9660 syx, hwitum on ma, swa swæ þæs feos
andef biñ ("Then on the same day [that they] him to the
pale bear will, then divide thy property that there to return, and he shall be after the chase and the sports, into five or
six, at times into more, according as the property's value is.

The poetry was distinguished by alliteration, and the abundant
use of figurative and metaphorical expressions, of bold compo-
ses and archaic words never found in prose. Thus in the following
lines from Beowulf (ed. Thorpe, l. 645, Zuippita 330):

> Stræt weas stan-fih, stig wisse
> Gumum egcgeu, nacn þæm scane
> Heard hond-locen, kringle-ern-scur
> Song in searum, þa he to see fulfurum
> In hyra gyre geawum gangan eowmon.

> The street was stone-variegated, the path guided
> (The) men together; the war-mailcoat shone
> Hard hand-locked, bright-ringed pail
> Sang in their cunning-trappings, as they to hall forth
> In their horror-accoutrements going came.

The Old English was a homogeneous language, having very
few foreign elements in it, and forming its compounds and
derivatives entirely from its own resources. A few Latin
appellatives learned from the Romans in the German wars had
been adopted into the common West Germanic tongue, and are
found in English as in the allied dialects. Such were striate
street, via striata, camp (battle), cæsere (Cesar), milt (miles), pin
(punishment), myner (money), pund (pound), wîn (wine); probably
also cyricle (church), bishop (bishop), ladan (Latin language), cæże
(chese), byðor (butter), ðeþor (pepper), ðelfand (camel), eleþan,
ynce (ince, uncia), and a few others. The relations of the first
invaders to the Britons were to a great extent those of destroyers;
and with the exception of the proper names of places and promi-
nent natural features, which as is usual were retained by the
new population, few British words found their way into the Old
English. Among these are named broc (a badger), bríc (breeches),
clād (cloth), þæl (pool), and a few words relating to the employ-
ment of field or household menials. Still fewer words seem to
have been adopted from the provincial Latin, almost the only
certain ones being castræ, applied to the Roman towns, which
appeared in English as castræ, ceaster, now found in composition as
-caster, -chester, -caster, and culina (kitchen), which gave clyne
(kiln).

The introduction and gradual adoption of Christianity, brought
a new series of Latin words connected with the offices of the
church, the accompaniments of higher civilization, the foreign
productions either actually made known, or mentioned in the
Scriptures and devotional books. Such were myster (momas-
terium), manuc (monk), nunne (nun), naessa (mass), schol
(school), almesse (eleemosyna), candela (candle), turtle (turtur),
līc (licus), cedor (cedrus). These words, whose number increased
from the 7th to the 10th century, are commonly called Latin
of the second period, the Latin of the first period including the
Latin words brought by the English from the continent, as well
as those picked up in Britain either from the Roman provincials
or the Welsh. The Danish invasions of the 8th and 10th centuries
resulted in the establishment of extensive Danish and Norwegian populations, about the basin of the Humber and its tributaries, and above Morecambe Bay. Although the consonants w and v, being represented as w or v in Old English, had in Old Norse a corresponding form and a pronunciation somewhat different from the Welsh y by f. The Runes called "thorn" and "wunr," having the consonantal values now expressed by th and w, for which the Roman alphabet had no character, were at first expressed by th, w (a contraction for bθ or bhw), and v or u; but at a later period the characters þ and þ were revived from the old Runic alphabet. Contrary to Continental usage, the letters c and g (g) had originally only their hard or guttural powers, as in the neighbouring Celtic languages; so that words which in the Continental Runic alphabet came to be used for Germanic languages had to be written with k, were in Old English written with c, as cæn = keen, cynd = kind.4 The key to the values of the letters, and thus to the pronunciation of Old English, is also to be found in the Celtic tongues whereas the letters were taken.

The Old English period is usually considered as terminating 1150, with the death of the generation who saw the Norman Conquest. The Conquest established in England a foreign court, a foreign aristocracy and a foreign hierarchy.5 The French language, in its Norman dialect, became the only polite medium of intercourse. The native tongue, despised not only as unknown but as the language of a subject race, was left to the use of boors and serfs, and except in a few stray cases ceased to be written at all. The natural results followed.6 When the educated generation that saw the arrival of the Norman died out, the language, ceasing to be read and written, lost all its literary values. The worst of ordinary life which was not independent of books lived on as vigorously as ever, but the literary terms, those that related to science, art and higher culture, the bold artistic compounds, the figurative terms of poetry, were speedily forgotten. The practical vocabulary shrank to a fraction of its former extent. And when, generations later, English began to be used for general literature, the only terms at hand to express ideas above those of every-day life were to be found in the French of the privileged classes, of whom alone art, science, law and theology had been for generations the inheritance. Hence each successive literary effort of the reviving English tongue showed a larger adoption of French words to supply the place of the forgotten native ones, till by the days of Chaucer they constituted a notable part of the vocabulary. Nor was it for the time being only that the French words affected the English vocabulary. The Norman French words were introduced by the Normans, as well as by the Central or Parisian French words which followed under the early Plantagenets, were mainly Latin words which had lived on among the people of Gaul, and, modified in the mouths of succeeding generations, had reached forms more or less remote from their originals. In being now adopted as English, they supplied precedents in accordance with which other Latin words might be converted into English ones, whenever required; and long before the Renascence of classical learning, though in much greater numbers after that epoch, these precedents were freely followed.

While the eventual though distant result of the Norman Conquest was thus a large reconstruction of the English vocabulary,

1. During the Old English period both c and g appear to have acquired a palatal value in conjunction with front or palatal vowels, except in the north where c, and in some cases g, tended to remain guttural in such positions. This value was not distinguished in Old English writing, but may be deduced from certain phonetic changes depending upon it, and from the use of c, ce, as an alternative for i (as in the old, eor, eord = order, fæstan = fetch), as well as from the normal occurrence of ch and y in these positions in later stages of the language, e.g. cild = child, laccean = leek, Gislen = yell, e. g.Þ

2. A discriminating view of the effects of the Norman Conquest on the English Language, see Freeman, Norman Conquest, ch. xxv.4

There is no reason to suppose that any attempt was made to preserve or suppress the native tongue, which was indeed used in some official documents addressed to Englishmen by the Conqueror himself. Its social degradation seemed even on the point of coming over when it was considered a mark of long association more by the accession of the Angevin dynasty, under whom everything French received a fresh impetus.

See this Rhya, Lectures on Welsh Philology, v.

@d e f r s t. The letters q and w were not used, q being represented by cm, and w was a rare alternative to c; w or v was only a very rare occurrence of w being represented as w by th, w, for which the Roman alphabet had no character, were at first expressed by th, w (a contraction for bθ or bhw), and v or u; but at a later period the characters þ and þ were revived from the old Runic alphabet. Contrary to Continental usage, the letters c and g (g) had originally only their hard or guttural powers, as in the neighbouring Celtic languages; so that words which in the Continental Runic alphabet came to be used for Germanic languages had to be written with k, were in Old English written with c, as cæn = keen, cynd = kind. The key to the values of the letters, and thus to the pronunciation of Old English, is also to be found in the Celtic tongues whereas the letters were taken.

The Old English period is usually considered as terminating 1150, with the death of the generation who saw the Norman Conquest. The Conquest established in England a foreign court, a foreign aristocracy and a foreign hierarchy.6 The French language, in its Norman dialect, became the only polite medium of intercourse. The native tongue, despised not only as unknown but as the language of a subject race, was left to the use of boors and serfs, and except in a few stray cases ceased to be written at all. The natural results followed.7 When the educated generation that saw the arrival of the Norman died out, the language, ceasing to be read and written, lost all its literary values. The worst of ordinary life which was not independent of books lived on as vigorously as ever, but the literary terms, those that related to science, art and higher culture, the bold artistic compounds, the figurative terms of poetry, were speedily forgotten. The practical vocabulary shrank to a fraction of its former extent. And when, generations later, English began to be used for general literature, the only terms at hand to express ideas above those of every-day life were to be found in the French of the privileged classes, of whom alone art, science, law and theology had been for generations the inheritance. Hence each successive literary effort of the reviving English tongue showed a larger adoption of French words to supply the place of the forgotten native ones, till by the days of Chaucer they constituted a notable part of the vocabulary. Nor was it for the time being only that the French words affected the English vocabulary. The Norman French words were introduced by the Normans, as well as by the Central or Parisian French words which followed under the early Plantagenets, were mainly Latin words which had lived on among the people of Gaul, and, modified in the mouths of succeeding generations, had reached forms more or less remote from their originals. In being now adopted as English, they supplied precedents in accordance with which other Latin words might be converted into English ones, whenever required; and long before the Renascence of classical learning, though in much greater numbers after that epoch, these precedents were freely followed.

While the eventual though distant result of the Norman Conquest was thus a large reconstruction of the English vocabulary,
the grammar of the language was not directly affected by it. There was no reason why it should—we might almost add, no way by which it could. While the English used their own words, they could not forget their own way of using them, the inflections and constructions by which alone the words expressed ideas— in other words, their grammar; when one by one French words were introduced into the sentence they became English by the very act of admission, and were at once subjected to all the duties and liabilities of English words in the same position. This is of course precisely what happens at the present day: telegraph and telegram make participle telegraphing and plural telegrams, and notice the adverb notlessly, precisely as if they had been in the language for ages.

Indirectly the grammar was affected very quickly. In languages in the inflected or synthetic stage the terminations must be pronounced with marked distinctness, as these contain the correlation of ideas; it is all-important to hear whether a word is bonus or bonis or bonus or bonos. This implies a measured and distinct pronunciation, against which the effort for ease and rapidity of utterance is continually struggling, while idleness and carelessness continually compromise it. In the Germanic languages, as a whole, the main stress-accent falls on the radical syllable, or on the prefix of a compound; in Middle English the accent fell on the second syllable of the compound, and thus at or near the beginning of the word; and the result of this in English has been a growing tendency to suffer the concluding syllables to fall into obscurity. We are familiar with the cockney winder, sofer, hollow, sailor, Sunderland, would yer, for window, solo, holla, Sarah, Sunday, would you, the various final vowels sinking into an obscure neutral one now conventionally spelt er, but formerly represented by final e. Already before the Conquest, forms originally hola, sola, tanga, appeared as hale, sole, tawne, with the terminations levelled to obscure it; but during the illiterate period of the language after the Conquest this careless obscuring of terminal vowels became universal, all unaccented vowels in the final syllable (except i) sinking into e. During the 12th century, while this change was going on, we see a great confusion of grammatical forms, the full inflections of Old English standing side by side in the same sentence with the levelled ones of Middle English. It is to this state of the language that the names Transition and Period of Confusion (Dr Abbott's appellation) point; its appearance, as that of Anglo-Saxon broken down in its endings, had previously given to it the suggestive if not logical appellation of Semi-Saxon.

Although the written remains of the transition stage are few, sufficient exist to enable us to trace the course of linguistic change in some of the dialects. Within three generations after the Conquest, faithful pens were at work transliterating the old homilies of Ælfric, and other lights of the Anglo-Saxon Church, in other words, of the language of the English church, in the reigns of Stephen and Henry II. Ælfric's gospels were similarly modernized so as to be "understood of the people." Homilies and other religious works of the end of the 12th century ¹ show us the change still further advanced, and the language passing into Early Middle English in its southern form. While these southern remains carry on in unbroken sequence the history of the Old English of Alfred and Ælfric, the history of the northern English is an entire blank from the 11th to the 14th century. Of the transition stage, and the terrible retaliation inflicted by William, effectively effaced northern English culture for centuries. If anything was written in the vernacular in the kingdom of Scotland during the same period, it probably perished during the calamities to which that country was subjected during the half-century of struggle for independence. In reality, however, the northern English had entered upon its transition stage two centuries earlier: the glosses of the 10th century show that the Danish invades had there anticipated the results hastened by the Norman Conquest in the south.

Meanwhile a dialect was making its appearance in another quarter of England, destined to overshadow the old literary dialects of north and south alike, and become the English of the future. The Mercian kingdom, which, as its name imports, lay along the marches of the earlier states, and was really a congeries of the petty members of the northern compound, was more isolated from the beginning a linguistic mixture and transition; and it is evident that more than one intermediate form of speech arose within its confines, between Lancashire and the Thames. The specimens of early Mercian now in existence consist mainly of glosses, in a mixed Mercian and southern dialect, dating from the 8th century; but, in a 9th-century gloss, the so-called Vespasian Psalter, representing what is generally held to be pure Mercian. Towards the close of the Old English period we find some portions of a gloss to the Rubruch Gospels, namely in St Matthew and a few verses of St John xvii., to be in Mercian. These glosses, with a few charters and one or two small fragments, represent a form of English which in many respects stands midway between Northumbrian and Kentish, approaching the one or the other more nearly as we have to do with North Mercian or South Mercian. And soon after the Conquest we find an undoubted midland dialect in the transition stage from the old 6th-century compound to the Saxon language, a dialect bounded on the south and south-east by the Saxon Middlesex and Essex, and on the east and north by the East Anglian Norfolk and Suffolk and the Danish settlements on the Trent and Humber. In this district, and in the monastery of Peterborough, one of the copies of the Anglo-Saxon Chronicle, transcribed about 1120, was continued by two succeeding hands to the death of Stephen in 1154. The section from 1122 to 1131, probably written in the latter year, shows a notable confusion between Old English forms and those of a Middle English, impatient to rid itself of the inflectional trammels which were still, though in weakened forms, so faithfully retained south of the Thames. And in the concluding section, containing the annals from 1132 to 1154, and written somewhere about the latter year, we find Middle English fairly started on its career. A specimen of this new tongue will best show the change that had taken place:

1140 A.D.—And 4 te eorl of Angaeu weerd ded, and his sunu Henri to O Pe rice. And te cuen of France to-diefel fra Pe king, and ec in com to Pe iunge eorl Henri. and he to hire to wiuie, and al Petou mid hire. Pa ferde he mid micel ferd into England and wam castale— and te king ferde agenes him mid micel mare ferd. PoPwethere fuhten hi noht. oc ferden Pe meccebiscop and te wise men betwix heom, and makede that sahte that te king sculde be luardi and king and his sculde be luardi. Te eorl he wende Henekind, and sethe Ceser the Micel, and ferde he on meanstede, and ferde he fader, and he him for suhe, and sib and sahte sculde betwix wyom, and on al England.

With this may be contrasted a specimen of southern English, from a document of the 12th century, the Hatton Gospels, Luke i. 469:

Da cwa8 Maria: Min saual mered drihten, and min gast geblisode on gode minen helende. For Pam Pe he geseah his Finene eadmodnynce. Soffixe henen-for me cadige seggeh alle cneornesse; for Pam Pe me mychele Ping dyde se Pe mibryg yh; and his name is halig. And his midhoertynse on cneornise on cneornese hine ondraedende. He worhtne maegne on hys earme; he to-daeide Pa me, on moda heora biortan. He warp Pa rice of setelde, and Pa eadmode he up-an-hof. Hyngriende he mid gode ge-fele, and Pa oferomde ydele for-le. He afeng israel his eanh, and gemynse his midhoertynse: Swa he sprac to ure laderen, Abraham and Iosse on a woerdde.

To a still later date, apparently close upon 1200, belongs the versified chronicle of Layamon or Lawman, a priest of Ernely on the Severn, who, using as his basis the French Brut of Wace, expanded it by additions from other sources to more than twice the extent: his work of 32,50 lines is a mine of illustration for the history of his time, and of the stage of his language, that between midland and southern, and the language, though forty years later than the specimen from the Chronicle, is much more archaic in structure, and can scarcely be considered even as Early Middle English. The following is a specimen (lines 9064—9079):

¹ The article be becomes te after a preceding i or d by assimilation.
² Earle, Two of the Saxon Chronicles parallel (1865), p. 255.
³ Skene, Anglo-Saxon and Northumbrian Gospels (1874).
On Kinbelines dauie . . . Fe king was inne Bruteena, con a Pissen middel ay, was . . . babes aile burden. He is ihaten Jesu Crist . . . Purt Pene halie gost, alre worulde wunne . . . walden englente; faeder he is on heuen . . . froure moncenures; sun he is on eorfn . . . of sele Jon mandene, & Pene halie gost . . . halde9 mid him secolen.

The Middle English was pre-eminently the Dialectal period of the language. It was not till after the middle of the 14th century that English obtained official recognition. For three centuries, therefore, there was no standard form of speech which claimed any pre-eminence over the others. The writers of each district wrote in the dialect familiar to them; and between extreme forms the difference was so great as to amount to unintelligibility; works written for southern Englishmen had to be translated for the benefit of the men of the north:

"In sotherin Inglis was it drawin, And turnd ic haue it till ur awin Langage of Pe northin lede That can na nothir Inglis rede."

_Cursor Mundi_, 20.064.

Three main dialects were distinguished by contemporary writers, as in the often-quotted passage from Trevisia's translation of Higden's _Polychronicon_ completed in 1357:

"Also Englyshe men . . . halde fra . . . spygunynge pre maner speche, Souperon, Norperron and Myddel speche (in Pe myddel of Pe lond) as hy com of Pre maner people of Germania. . . Also of Pe foreseide tonge, Pat ys day der poulker. Pat ys der scouth yf ympe psyche wil lew pe uplyshode men and ys gret wondor, for men of Pe est wip men of Pe west, as hyt were under Pe same part of hyveyne, acordeP more in souynge of Speche Pan men of Pe norp wip men of Pe soufP Perfore hyt ys Pat Merrick, Pat by men of myddel Engeland, as hyt were parteners of Pe endes, undurstonedeP bete Pe syde longages Norperron and Souperon, Pan Norperrn and Sou Perrn undurstonedeP syperP ouerP.

The modern study of these Middle English dialects, initiated by the elder Richard Garnett, scientifically pursued by Dr Richard Morris, and elaborated by many later scholars, both English and German, has shown that they were readily distinguished by the conjugation of the present tense of the verb, in which typical specimens was as follows:

_Southern._
Ich singe. We singeP.
Pou singest. Je singeP.
He singeP. Hy singeP.

_Midland._
Ich, I. singe. We singen.
Pou singest. Je singen.
He singeP. Hy, the, singen.

_Northern._
Ie, I, singe(P) (I Pat singes).
Pou singes.
He singes.

Of these the southern is simply the old West-Saxon, with the vowels levelled to e. The northern second person in -es presents an older form than the southern and West-Saxon -est; but the -est of the third person and plural is derived from an older -eth, the change of -eth into -es being found in progress in the Durham glosses of the 10th century. In the plural, when accompanied by the pronoun subject, the verb had already dropped the inflections entirely as in Modern English. The origin of the -en plural in the midland dialect, unknown to Old English, is probably an instance of _form-leveling_, the inflection of the present indicative assimilated to that of the past, and the present and past subjunctive, in all of which -en was the plural termination. In the declension of nouns, adjectives and pronouns, the northern dialect had attained before the end of the 13th century to the simplicity of Modern English, while the southern dialect still retained a large number of inflections, and the midland a considerable number. The dialects differed also in phonology, for while the northern generally retained the hard or guttural values of h, g, sc, these were in the two other dialects palatalized before front vowels into ch, j and ng. Kirke, kniche or church, brag, bridge; scryke, shrick, are examples. Old English_hu_ was written in the north _hu(h)_ but elsewhere _u_, often sinking into _u_.

The original long _ā_ in _stān, mār_, preserved in the northern _stane_, more, became _ā_ elsewhere, as in _stone, more_. So that the north presented a general aspect of conservation of old sounds with the most thorough-going dissolution of old inflections; the south, a tenacious retention of the inflections, with an extensive evolution in the sounds. One important respect, however, in the Venon was far ahead in the north: the final _e_ to which all the old vowels had been levelled during the transition stage, and which is a distinguishing feature of Middle English in the midland and southern dialects, became mute, _i.e._, disappeared, in the northern dialect before that dialect emerged from its three centuries of obscurity, shortly before 1300. So thoroughly modern had its form consequently become that we might almost call it Modern English, and say that the Middle English of the northern dialect is lost. For comparison with the other dialects, however, the same nomenclature may be used, and we may class as Middle English the extensive literature which northern England produced during the 14th century. The earliest specimen is probably the Metrical Psalter in the Cotton Library,1 copied during the reign of Edward II. from an original of the previous century. The gigantic versified paraphrase of Scripture history called the _Cursor Mundi_,2 is held also to have been composed before 1300. The dates of the numerous half-romance romances in this dialect have not been determined with exactness, as all survive in later copies, but it is probable that some of them were written before 1300. In the 14th century appeared the theological and devotional works of Richard Rolle the anchorite of Hampole, Dan Jon Gaytrigg, William of Nassington, and other writers whose names are unknown; and towards the close of the century, specimens of the language also appear from Scotland both in official documents and in the poetical works of John Barbour, whose language, barring minute points of orthography, is identical with that of the contemporary northern English writers. From 1400 onward, the distinction between northern English and Lowland Scottish becomes clearly marked.

In the southern dialect one version of the work called the _Ancren Rivo_ or "Rule of Nuns,"3 adapted about 1225 for a small sisterhood at Tarrant-Kaines, in Dorsetshire, exhibits a dialectal characteristic which had probably long prevailed in the south, though concealed by the spelling, in the use of _a_ for _e_; as _mule_ fall, _nordone_ fordo, _woro_ for to, _veder_ father, _wor_ from. Not till later do we find a recognition of the parallel use of _a_ for _e_. Among the writings which succeeded, _The Owl and the Nightingale_ of Nicholas de Guildford, of Portesham in Dorsetshire, before 1250, the _Chronicle of Robert of Gloucester_, 1298, and Trevisia's translation of Higden, 1357, are of special importance in illustrating the history of southern English. The earliest form of _Langland's Piers Ploughman_ is, of the spirit of the Vernon MS., appears to be in an intermediate dialect between southern and midland.4 The Kentish form of southern English seems to have retained specially archaic features; five short verses in it of the middle of the 13th century were edited by Dr Morris (1866); but the great work illustrating it is the _Aycenile of Inwyt_ (Remorse of Conscience), 1340, a translation from the French by Dan Michel of Northgate, Kent, who tells us—

_sett Pia boc is y-write mid englies of Kent;_ _Pia boc_ is y-mad uor lewede men, _Vor uader, and uor moder, and uor oper ken, _Ham uor to berje uram alle manere zem,_ _Pia boc he inwytte ne bleue no soul we._

In its use of _u_ (_u_) and _a_ for _f_ and _s_, and its grammatical inflections, it presents an extreme type of southern speech, with peculiarities specially Kentish; and in comparison with contemporary midland English works, it looks like a fossil of two centuries earlier.

Turning from the dialectal extremes of the Middle English to the midland speech, which we left at the closing leaves of the

4. Edited by Rev. Dr Morris for Early English Text Society, in 1866.
Peterborough Chronicle of 1154, we find a rapid development of this dialect, which was before long to become the national literary language. In this, the first great work is the Ormulum, or metrical Scripture paraphrase of Orm or Ormin, written about 1200, somewhere near the northern frontier of the midland area. The dialect has a decided smack of the north, and shows for the first time in English literature a large percentage of Scandinavian words, derived from the Danish settlers, who, in adopting English, had preserved a vast number of their ancestral forms of speech, which were in time to pass into the common language, of which they now constitute some of the most familiar words. Blunt, bull, die, dwell, ill, kid, rose, some, thrive, woad, wing, are words from this source, which appear first in the work of Orm, of which the following lines may be quoted:—

"De Judewise folkesse boca
headyde, Patt heven birde
Twa bukses samenn to Pe proest
att kirke-dure bringen;
And te13 Pa idenn bifiellis,
swa summ Pe boc hemn tahhte,
And bregtethen twejenn bukses Paer
Drihtin PerwIP to lakenn.

And att14 te kirke-dure toc
Pe proest ta twejenn bukses,
And o Patt an he13de Paer
all swa swa sake and sinne.

And let15 it cornenn forwIP all
ut inntill wilde wese;
And toc and sa16 Patt of Per buce
Drihtin PerwIP to lakenn.
All Pis wasd for horhere ned,
and ec for ure nod;
For herne it halp lícenn Godd
to cleeennenn hemn of sinne;
And all swa ma17 it hellpen Pe
Sif Patt tu willt [lit] folkshe.
Sif Patt tu willt full inswa18rd11
wIP fulle trowwYe lefenn.
All Patt tatt was bicaudel tuer,
to lefenn and to trowwewn."

Ormulum, ed. White, l. 1324.

The author of the Ormulum was a phonetist, and employed a special spelling of his own to represent not only the quality but the quantities of vowels and consonants—a circumstance which gives his work a peculiar value to the investigator. He is generally assumed to have been a native of Lincolnshire or Notts, but the point is a disputed one, and there is somewhat to be said for the neighbourhood of Ormskirk in Lancashire.

It is customary to differentiate between east and west midland, and to subdivide these again into north and south. As was natural in a tract of country which stretched from Lancaster to Essex, a very considerable variety is found in the documents which agree in presenting the leading midland features, those of Lancashire and Lincolnshire approaching the northern dialect both in vocabulary, phonetic character and greater neglect of inflections. But this diversity diminishes as we advance.

Thirty years after the Ormulum, the east midland rhymed Story of Genesis and Exodus1 shows us the dialect in a more southern form, with the vowels of modern English, and from about the same date, with rather more northern characteristics, we have an east midland Bestiary.

Different tests and different dates have been proposed for subdividing the Middle English period, but the most important is that of Hannah Nicol, based on the observation that in the early 13th century, as in Ormin, the Old English short vowels in an open syllable still retained their short quantity, as nóa, ðær, méte; but by 1250 or 1260 they had been lengthened to ná-mé, ðá-ær, mó-te, a change which has also taken place at a particular period in all the Germanic, and even the Romanic languages, as in bádo for bá-num, pá-dre for pá-rem, &c. The lengthening of the penult left the final syllable by contrast shortened or weakened, and paved the way for the disappearance of final ó in the century following, through the stages ná-mé, ná-m, nám, the one long syllable in nám(o) being the quantitative equivalent of the two short syllables in ná-mé; hence the notion that mute ó makes a preceding vowel long, the truth being that the lengthening of the vowel led to the ó becoming mute.

After 1250 we have the Lay of Havlok, and about 1300 the writings of Robert of Brunne in South Lincolnshire. In the 14th century we find a number of texts belonging to the western part of the district, and north-west midland is hardly to be distinguished from southern in its south-western form, and hence texts like Piers Plowman elude any satisfactory classification, but several metrical romances exhibit what are generally considered to be west midland characteristics, and a little group of poems, Sir Gawayne and the Grene Knight, the Pearl, Cleanlast and Patience, thought to be the work of a north-west midland writer of the 14th century, bear a striking resemblance to the modern Lancashire dialect. The end of the century witnessed the prose of Wycliff and Mandeville, and the poetry of Chaucer, with whom Middle English may be said to have culminated, and in whose writings its main characteristics as distinct from Old and Modern English may be studied. Thus, we find ðe in full use representing numerous original vowels and terminations as Him thoughteth that his hertë woldë brekë, in Old English—

Him Puhte Pat his heartë woltë breken,
which may be compared with the modern German—

Ihm dachte dass sein Herze wolte brechen.

In nouns the -er of the plural and genitive case is still syllabic—

Reede as the bezeth-es of a sow-es ear-es.

Several old genitives and plural forms continued to exist, and the dative or prepositional case has usually a final -e. Adjectives retain so much of the old declension as to have -e in the definite form and in the plural—

The tend-re cropp-es and the yong-e sonne.

And smal-e fowi-es maken melodie.

Numerous old forms of comparison were in use, which have not come down to Modern English, as here, forre, lenger, hest—higher, farther, longer, highest. In the pronouns, i3k lingered alongside of I; ðe was only nominative, and you object, with the northern ðes had dispossessed the southern by, but her and hem (the modern 'em) stood their ground against their and them. The verb is I love, thou lovest, he loveth; but, in the plural, loves is interchanged with love, as rhyme or euphony requires. So in the plural of the past we love-den or love-de. The infinitive also ends in en, often e, always syllabic. The present participle, in Old English -ende, passing through -inde, has been confounded with the verbal noun in -onge, -yinge, as in Modern English. The past participle largely retained the prefix -ge-, representing the Old English ge-—as in t-osome, y-pon, Old English serwemen, zedon, run, done. Many old verb forms still continued in existence. The adoption of French words, not only those of Norman introduction, but those subsequently introduced under the Angevin kings, to supply obsolete and obsolescent English ones, which had kept pace with the growth of literature since the beginning of the Middle English period, had now reached its climax; later times added many more, but they also dropped some that were in regular use with Chaucer and his contemporaries.

Chaucer's great contemporary, William Langland, in his Vision of William concerning Piers the Ploughman, and his imitator the author of Pierce the Ploughman's Crade (about 1400) used the Old English alliterative versification for the last time in the south. Rhyme had made its appearance in the language shortly after the Conquest—if not already known before; and in the south and midlands it became decidedly more popular than alliteration; the latter retained its hold much longer in the north, where it was written even after 1500: many of the northern romances are either simply alliterative, or have both alliteration and rhyme. To these characteristics of northern and southern verse respectively Chaucer alludes in the prologue of the "Persone," who, when called upon for his tale said:—

---

1 Here, and in tatt, to, ñser, for pair, pa, baed, after t, ð, there is the same phonetic assimilation as in the last section of the Anglo-Saxon Chronicle above.

2 Edited for the Early English Text Society by Dr Morris (1865).
"But trusteth well; I am a sootherne man, I cannot geste rom, ram, ruf, by my letter. And, God wote, rime hold I but better: Alack, I say, if you list, thou not close, I wol you tell a little tale in prose."

The changes from Old to Middle English may be summed up thus: Loss of a large part of the native vocabulary, and adoption of French words to fill their place; not infrequent adoption of French words as synonyms of existing native ones; modernization of the English words preserved, by vowel change in a definite direction from back to front, and from open to close; change of initial s to sh, and of diphthongs oo, eu, and development of new diphthongs in connexion with e, a, and w; adoption of French orthographic symbols, e.g. ou for o, qu, v, ch, and gradual loss of the symbols j, h, ð, ð;/ obscuration of vowels after the accent, and especially of final a, o, u to e; consequent confusion and loss of old inflections, and their replacement by prepositions, auxiliaries, verbs and rules of position; abandonment of alliteration for rhyme; and great development of dialects, in consequence of the being no standard or recognized type of English. But the recognition came at length. Already in 1258 was issued the celebrated English proclamation of Henry III., or rather of Simon de Montfort in his name, which, as the only public recognition of the native tongue between William the Conqueror and Edward III., has sometimes been spoken of as the first specimen of English. It runs:—

Henry pur godes Vultume King on Englelodsne Lasaerd on Yslel, Normande on Aquitaine et on Iriow. Send sigretige to alle hise holde ildere and ilweade on Huntendone-shire. Jete witen we alle peet we willen and vannes peet pe vue refrigerator alle oser pe moare dieul of heum peste beeslich ichosen pur us and pur) but loandels folk on vure kureriche, habbebidion and schullen don in be wortynesse of gode and on vure trefewe. The dialect of this document is more southern than anything else, with a slight midland admixture. It is much more archaic inflectionally than the Genesis and Exodus or Officeum; but it closely resembles the Old Kentish sermons and Proverbs of Alfred in the southern dialect of 1250. It represents no doubt the London speech of the day. London being in a Saxon county, and contiguous to Kent and Surrey, had certainly at first a southern dialect; but its position as the capital, as well as its proximity to the midland district, made its dialect more and more midland. Contemporary London documents show that Chaucer's language, which is distinctly more southern than standard English eventually became, is behind the London dialect of the day in this respect, and is at once more archaic and consequently more southern.

During the next hundred years English gained ground steadily, and by the reign of Edward III. French was so little known in England, that, great, that about 1350 "John Cornwal, a mayster of grame, chaungeled pe lore (=teaching) in grame scule and construction of [i.e. from] Freynsch into Englishs;"1 and in 1363-1365 English by statute took the place of French in the pleadings in courts of law. Every reason conspired that this "English should be the midland dialect. It was the intermediate dialect, intelligible, as Trevisa has told us, to both extremes, even when these failed to be intelligible to each other; in its south-eastern form, it was the language of London, where the supreme law courts were, the centre of political and commercial life; it was the language in which the Wycliffite versions had given the Holy Scriptures to the people; the language in which Chaucer had raised English poetry to a height of excellence admired and imitated by contemporaries and followers. And accordingly after the 14th century, all Englishmen who thought they had anything to say to their countrymen generally said it in the midland speech. Trevisa's own work was almost the last literary effort of the southern dialect; henceforth it was but a rustic patois, which the dramaticist might use to give local colouring to his creations, as Shakespeare uses it to complete Edgar's peasant disguise in Lear, or which 19th century research might displace to illustrate obscure chapters in the history of language. And though the northern English proved a little more stubborn, it disappeared also from literature in England; but in Scotland, which had now become politically and socially estranged from England, it continued its course as the national language of the country, attaining in the 15th and 16th centuries a distinct development and high literary culture, for the details of which readers are referred to the article on SCOTTISH LANGUAGE. The 15th century of English history, with its bloody French wars and Wars of the Roses, is too well known to require a period in literature, and a transition one in language, witnessing the decay and disappearance of the final e, and most of the syllabic inflections of Middle English. Already by 1420, in Chaucer's disciple Hoccleve, final e was quite uncertain; in Lydgate it was practically gone. In 1450 the writings of Pecock against the Wycliffites show the verbal inflections in -es in a state of obsolescence; he has still the southern pronouns her and hes for the modern their, theirs, heres.

"And here-a-stens boll scripture wrote pa men schulden lacke pe coreyng which wommen schulden haue, & thei schulden so lacke bi pa pe heris of her heedis schulden be chorne, & schulde not growe in waene toon as wommen schulden.

"Also herewilly into pe open sit of ymagis in open chircia alle peple, men & wommen & children mowe come whanne euere pe wol wolles in ech tyme of pe day, but so mowe be not come in-to be vey of bokis to be deluyed to hem neyther to be red biforn hem; & berfore, as for to soone & ofte come into remembrance of a long mater bi ech oon persoon, and also as forto make pa pe mo persoones come into remembrance of a mater, ymagis & picturis serven in a specialier maner bokis doon, bokis in an oper maner ful substanstiali bokis seruen better into remembrance of bo same materi pe magys & picturis doon; & bo bokis seruen better into remembrance of bo seif seif ringa, jist not at pe ful; Forwi pe bokis han not pe avail of remembrance now seid whene ymagis han."
for he also could speke no frenehse, but wolde hewe hadde egges; and she vnderstode hym not. And thence at laste a nother sayth that he also could speke no frenehse. And thence a nother sayth that she vnderstode hym wel. Loo! what shold a mariage in thase dayes now wyrite, egges or eyren? certeynly, it is hard to playse every man, by cause of dyverstye & chauenge of langage. For in thase dayes, every man that is in any reputacyon in this countrye wyfte his comyng caycgon & maters & termes that Fewe men shal vnderstond them. And som honeste & grete clerkes hau wyrt syngly, & we saye that a wyte wyrite his curiosy termes that I counde fynde. And thus bytwene playes, rude & curiosy, I stonde abassd; but in my judgemente, the comyn termes that be dayli vsed ben lyghter to vnderstode than the olde and auncient englyshe."

In the productions of Caxton's press we see the passage from Middle to Early Modern English completed. The earlier of these two may have an occasional verbal plural in -es, especially in the word they bes; the southern her and hem of Middle English vary with the northern and Modern English theirs, them. In the late works, the older forms have been practically ousted, and the year 1485, which witnessed the establishment of the Tudor dynasty, may be conveniently put as that which closed the Middle English transition, and introduced Modern English. Both in the completion of this result, and in its comparative permanency, Caxton's press had an important share. His exclusive patronage of the midland speech, it raised it still higher above the sister dialects, and secured its abiding victory. As books were multiplied and found their way into every corner of the land, and the art of reading became a more common acquirement, the man of Northumberland or of Somersetshire had forced upon his attention the book-English in which alone these were printed. This became in turn the model for his own writings, and by-and-by, if he made any pretensions to education of his own speech. The written form of the language also tended to uniformity. In previous periods the scribe made his own spelling with a primary aim at expressing his own speech, according to the particular values attached by himself or his contemporaries to the letters and combinations of the alphabet, though liable to disturbance in the most common words and combinations by his ocular recollections of the spelling of others. But after the introduction of printing, this ocular recognition of words became ever more and more an aim; the book addressed the mind directly through the eye, instead of circuitously through eye and ear; and thus there was a continuous tendency for written words and parts of words to be reduced to a single form, and that the most usual, or through some accident the best known, but not necessarily that which would have been chosen had the ear been called in as umpire. Modern English spelling, with its rigid uniformity as to individual results and whimsical capriciousness as to principles, is the creation of the printing-office, the victory which, after a century and a half of struggle, mechanical convenience won over natural habits. Besides eventually creating a uniformity in writing, the introduction of printing made or at least ratified some important changes. The British and Old English form of the Roman alphabet has already been referred to. This at the Norman Conquest was superseded by an alphabet with the French forms and values of the letters. Thus t took the place of the older c before e and s; k replaced e; the Norman w took the place of the ven (p), kcs; and hence it has often been said that Middle English stands nearer to Old English in pronunciation, but to Modern English in spelling. But there were certain sounds in English for which Norman writing had no provision; and for these, in writing English, the native characters were retained. Thus the Old English g (g), beside the sound in go, had a guttural sound as in German tag, Irish magc, and in certain positions a palatalized form; and approaching y as in you (if pronounced with aspiration kyou or ghyou). These sounds continued to be written with the native form of the letter as bur, 3our, while the French form was used for the sounds in go, age,—one original letter being thus represented by two. So for the sounds of th, especially the sound in that, the Old English thorn (th) continued to be used. But as these characters were not used for French and Latin, their use even in English became disturbed towards the 13th century, and when printing was introduced, the founts, cast for continental languages, had no characters for them, so that they were dropped entirely, being replaced, 3 by gh, yh, y, and 3 by th. This was a real loss to the English alphabet. In the north it is curious that the printers tried to express the forms rather than the powers of these letters, and consequently 3 was represented by s, the black letter form of which was confounded with it, while the v was expressed by y, which in its M.S. form had come to approach on some cases simulate. So in early Scotch books we find salam, se, yet, vem=yellow, ye, that, them; and in Modern Scottish, such names as Memies, Dalies, Cockemie, and the word gobernanse, in which the x stands for y.

Modern English thus dates from Caxton. The language had at length reached the all but sectionless state which it now presents. A single older verbal form, the southern -sth of the third person singular, continued to be the literary prose form throughout the 16th century, but the northern form in -st was internized with it in poetry (where it saved a syllable), and must ere long, as we see from Shakespeare, have taken its place in familiar speech. The fuller on, none, mine, thine, in the early part of the 16th century at least, were used in positions where their shortened forms a, no, my, thy are now found (none other, mine own = no other, my own). But with such minute exceptions, the accent of the 16th century was the accent of the 19th. While, however, the older inflections had disappeared, there was as yet no general agreement as to the mode of their replacement. Hence the 16th century shows a syntactic licence and freedom which distinguishes it strikingly from that of later times. The language seems to be in a plastic, uniformed state, and its writers, as it were, experiment with it, bending it to constructions which now seem indefensible. Old distinctions of case and mood have disappeared from noun and verb, without custom having yet decided what prepositions or auxiliary verbs shall most fittingly convey their meaning. The laxity of word-order which was permitted in older states of the language by the formal expression of relations was often continued though the inflections which expressed the relations had disappeared. Partial analogy was followed in allowing forms to be identified in one case, because, in another, such identification was accidentally produced, as for instance the past participles of write and take were often made wrote and took, because the contracted participles of bind and break were bound and broke. Finally, because, in dropping inflections, the former distinctions even between parts of speech had disappeared, so that iron, e.g., was at once noun, adjective and verb, dean, adjectival, verb and adverb, it appeared as if any word whatever might be used in any grammatical relation, where it conveyed the idea of the speaker. Thus, as has been pointed out by Dr Abbott, "you can happy your friend, mailce foo your enemy, or fell an axe on his neck. You can speak and be in chains, free, executed, free, killed by fair instance of beauty (fairness), and a pale instead of a painess. A he is used for a man, and a lady is described by a gentleman as 'the fairest she he has yet beheld.' An adverb can be used as a verb, as 'they askans their eyes'; as a noun, 'the backword and abyss of time'; or as an adjective, a 'seldom pleasure.'"

For, as he also says, "clearness was preferred to grammatical correctness, and brevity both to correctness and clearness. Hence it was only a matter of place words in the line in which they could not appear most in the mind without much regard to syntax, and the result was a forcible and perfectly unambiguous but ungrammatical sentence, such as"

The prince that feeds great natures they will slay him.

Ben Jonson.

or, as instances of brevity,

Be guilty of my death since of my crime.

Shakespeare.

It cost more to get than to lose in a day.

Ben Jonson."

These characteristics, together with the presence of words now obsolete or archaic, and the use of existing words in senses

1 A Shakspearean Grammar, by Dr E. A. Abbott. To this book we are largely indebted for its admirable summary of the characters of Tudor English.
different from our own, as general for specific, literal for metaphorical, and vice versa, which are so apparent to every reader of the 16th-century literature, make it useful to separate Early Modern or Tudor English from the subsequent and still existing stage, since the consensus of usage has declared in favour of individual senses and constructions which are alone admissible in the former.

The beginning of the Tudor period was contemporaneous with the Renaissance in art and literature, and the dawn of modern discoveries in geography and science. The revival of the study of the classical writers of Greece and Rome, and the translation of their works into the vernacular, led to the introduction of an immense number of new words derived from these languages, either to express new ideas and objects or to indicate new distinctions in or grouping of old ideas. Often also it seemed as if scholars were so pervaded with the form as well as the spirit of the old, that it came more natural to them to express themselves in words borrowed from the old than in their native tongue, and thus words of Latin origin were introduced even when English already possessed perfectly good equivalents. As has already been stated, the French words of Norman and Angevin introduction, being principally Latin words in an altered form, when used as English supplied models whereby other Latin words could be converted into English ones, and it is after these models that the Latin words introduced during and since the 16th century have been fashioned. There is nothing in the form of the words procession and progress to show that the one was used in England in the 11th, the other not till the 17th century. Moreover, as the formation of new words from Latin had gone on in French as well as in English since the Renaissance, we often cannot tell whether such words, e.g. as persuade and persuasion, were borrowed from their French equivalents or formed from Latin in England independently. With some words indeed it is impossible to say whether they were formed in England directly from Latin, borrowed from contemporary late French, or had been in England since the Norman period, even photograph, geology and telephone have the form that they would have had if they had been living words in the mouths of Greeks, Latins, French and English from the beginning, instead of formations of the 19th century. While every writer was thus introducing new words according to his notion of their being needed, it naturally happened that a large number were not accepted by contemporaries or posterity; a long list might be formed of these mintoages of the 16th and 17th centuries, which either never became current coin, or circulated only as it were for a moment. The revived study of Latin and Greek also led to modifications in the spelling of some words which had entered Middle English in the French form. So Middle English doune, doubt, double to doubt, disturb to disturb, due to due; connexion with Latin dubium, debirum; the actual derivation from the French being ignored. Similarly, words containing a Latin and French t, which might be traced back to an original Greek θ, were remodelled upon the Greek, e.g. theme, throne, for Middle English tene, trone, and, by false association with Greek, anthem, Old English ansege, Latin antiphona; Anodyne, Latin Aemunia; Thames, Latin Tamesis, apparently after Thomas.

The voyages of English navigators in the latter part of the 16th century introduced a considerable number of Spanish words, and American words in Spanish forms, of which negro, potato, tobacco, cargo, armadillo, alligator, galleon may serve as examples.

The date of 1611, which nearly coincides with the end of Shakespeare's literary work, and marks the appearance of the Authorized Version of the Bible (a compilation from the various 16th-century versions), may be taken as marking the end of Latin words could be seen as the language modern in structure, style and expression, although the spelling did not settle down to present usage till about the revolution of 1688. The latter date also marks the disappearance from literature of a large number of words, chiefly of such as were derived from Latin during the 16th and 17th centuries. Of these nearly all that survived 1688 are still in use; but a long list might be made out of those that appear for the last time before that date. This sifting of the literary vocabulary and gradual fixing of the literary spelling, which went on between 1611, when the language became fixed in structure, Anglo-Saxon when it became modern also in form, suggests for this period the name of Seventeenth-Century Transition. The distinctive features of Modern English have already been anticipated by way of contrast with preceding stages of the language. It is only necessary to refer to the fact that the vocabulary is now much more composite than at any previous period. The immense development of the physical sciences has called for a corresponding extension of terminology which has been supplied from Latin and especially Greek; and although these terms are in the first instance technical, yet, with the spread of education and general diffusion of the rudiments and appliances of science, the boundary line between technical and general, indefinite at the best, tends more and more to melt away—this in addition to the fact that words still technical become general in figurative or metonymic senses. Ake, diamond, stomach, comet, organ, bone, ball, card, are none the less familiar because once technical words. Commercial, social, artistic or political contact has also led to the adoption of numerous words from modern European languages, especially French, Italian, Portuguese, Dutch (these two at a less recent period): thus from French voirre, stanche, déport, débris, programme, prestige; from Italian busto, canto, folio, cartoon, regatta, raffia; from Portuguese casse, palaver; from Dutch yacht, skipper, schooner, sleep. Commercial intercourse and colonization have extended far beyond Europe, and given us words more or fewer from Hindostani, Persian, Arabic, Turkish, Malay, Chinese, and from American, Australian, Polynesian and African languages. More important even than these, perhaps, are the dialect words that from time to time obtain literary recognition, restoring to us obsolete Old English forms, and not seldom words of Celtic or Danish origin, which have been preserved in local dialects, and thus at length find their way into the standard language.

As to the actual proportion of the various elements of the language, it is probable that original English words do not now form more than a fourth or perhaps a fifth of the total entries in a full English dictionary; and it may seem strange, therefore, that we still identify the language with that of the 9th century, and class it as a member of the Low German division. But this explains itself, when we consider that of the total words in a dictionary only a small portion are used by any one individual in speaking or even in writing; that this portion includes the majority of the words now a standard word, while a large portion of the others. The latter are in fact almost all names—the vast majority names of things (nouns), a smaller number names of attributes and actions (adjectives and verbs), and, from their very nature, names of the things, attributes and actions which come less usually or, it may be, very rarely under our notice. Thus in an ordinary book, a novel or story, the foreign elements will amount to from 10 to 15% of the whole; as the subject becomes more technical or technical their number will increase; still in a work on chemistry or abstruse mathematics the proportion may be 40%. But after all, it is not the question whence words may have been taken, but how they are used in a language that settles its character. If new words when adopted conform themselves to the manner and usage of the adopting language, it becomes absolutely no difference whether they are taken over from some other language, or invented off at the ground. In either case becomes more recourse to them; in either case, if the reasons needed, they will become as thoroughly native, i.e. familiar from childhood to those who use them, as those that possess the longest native pedigree. In this respect English is still the same language it was in the days of Alfred; and, comparing its history with that of other Low German tongues, there is no reason to believe that

1 Evangelist, astronomy, dialogue, are words that have so lived, of which their form is the result. Photograph, geology, &c., take this form as if they had the same history.

2 See extended lists of the foreign words in English in Dr Morris's Historical Outlines of English Accidence, p. 33.
its grammar or structure would have been very different, however
different its vocabulary might have been, if the Norman Conquest
had never taken place.

A general broad view of the sources of the English vocabulary
and of the dates at which the various foreign elements flowed
into the language, as well as of the great change produced in it
by the Norman Conquest, and consequent influx of French and
Latin elements, is given in the accompanying chart. The
transverse lines represent centuries, and it will be seen how
limited a period after all is occupied by modern English, how
long the language had been in the country before the Norman
Conquest, and how much of this is prehistoric and without any
literary remains. Judging by what has happened during the
historic period, great changes may and indeed must have taken
place between the first arrival of the Saxons and the days of
stones, mine, doom, day, nail, child, bridge, shoot, Anglo-Saxon stan,
men, dom, dag, nagei, cid, brycg, seto. The history of English
sounds (see Phonetics) is given on pp. 586, 587, by W. D. F. J.
Ellis and Dr Henry Sweet; and it is only necessary here to
indicate the broad facts, which are the following. (1) In an
accented closed syllable, original short vowels have remained
nearly unchanged; thus the words at, men, bill, God, dust are
pronounced now nearly as in Old English, though the last two
were more like the Scotch o and North English u respectively,
and in most words the short a had a broader sound like the
provincial a in birds; the short e of built, and diphthongs have
undergone a regular sound shift towards closer and more
advanced positions, so that the words bōn, har, seeoe or steo, stōh
(bahn or bawn, hör, stōk or stōik, stōle) are now bōne, hair, seek,
stool; while the two high vowels û (≈ou) and i (≈e) have become
diphthongs, as lōds, sēor, now house, shire, though the old sound of u remains in the north (house),
say, and the original û in the pronunciation sheer,
approved by Walker, "as in machine, shire, and
magazine." (3) Short vowels in an open
syllable have usually been lengthened, as in
nāma, co-fa, now name, cone; but to this there
are exceptions, especially in the case of û and ù.
(4) Vowels in terminal unaccented syllables have
all sunk into short obscure i, and then, if final,
disappeared; so eoa, eō, wuads became ə-e, se-e,
waad-e, and then ûe, ûe, wood; oxan, leod, now
oxen, loved; selte, sēten, seitt, selte, sēett, now sett.
(5) The back consonants, c, g, sc, in
connexion with front vowels, have often become
palatalized to ûh, j, sh, as cîrce, rycg, fisc, now
church, ridge, fish. A medial or final g has passed
through a guttural or palatal continuant to w or
y, forming a diphthong or new vocal, as in bōga,
laga, dag, hag, digg, now bowl, lane, day, hoy, dry.
W and h have disappeared before r and l, as in
write, (w)risâ, (h)ring; f final (≈gh) has become
f, k, w or nothing, but has developed the glides
u or i before itself, these combining with the pre-
ceding vowel to form a diphthong, or merging
with it into a simple vowel-sound, as rugh, hoh,
boh, deah, heah, kîah, now rough, hough, bough,
dough, high, laugh-ruff; hoh, bōw, dō, dī, dīf.
R after a vowel has practically disappeared in
standard English, or at most become valorized, or
combined with the vowel, as in hâr, bōr, more,
har. These and other changes have taken place
gradually, and in accordance with well-known
phonetic laws; the details as to time and mode
may be studied in special works. It may be
mentioned that the total loss of grammatical gender
in English, and the almost complete disappear-
ance of cases, are purely phonetic phenomena.

King Alfred, when literature practically begins. The chart also
illustrates the continuity of the main stock of the vocabulary,
the body of primary "words of common life," which, notwithstanding
numerous losses and more numerous additions, has
preserved its corporate identity through all the periods. But
the "poetic and rhetorical," as well as the "scientific" terms
of Old English have died out, and a new vocabulary of "abstract
and general terms" has arisen from French, Latin and Greek,
while a still newer "technical, commercial and scientific"
vocabulary is composed of words not only from these, but from
every civilized and many uncivilized languages.

The preceding sketch has had reference mainly to the gram-
matical changes which the language has undergone; distinct from,
though intimately connected with these (as where the confusion
or loss of inflections was a consequence of the weakening of final
sounds) are the great phonetic changes which have taken place
between the 8th and 19th centuries, and which result in making
modern English words very different from their Anglo-Saxon
originals, even where no element has been lost, as in words like
gender (whatever its remote origin) was practically the use of
adjectives and pronouns with certain distinctive terminations,
in accordance with the genus, genre, gender or kind of nouns to
which they were attached; when these distinctive terminations
were uniformly levelled to final û or other weak sounds, and thus
ceded to distinguish nouns into kinds, the distinctions into
genders or kinds having no other existence than in Greek. Thus
when ûe gode hōr, ûe godan hōr, ûe godan hōrd, ûe godan hōrd, became, by
phonetic weakening, ûe gode hōr, ûe gode hōnd, ûe gode hōnd, and later still the good horse, the good hound, the good book, the
words horse, hound, book were no longer grammatically different
kinds of nouns; grammatical gender had ceased to exist.
The concord of adjectives has entirely disappeared; the concord of
the pronouns is now regulated by rationality and sex, instead of
grammatical gender, which has no existence in English.

The man who lost his life in the battle of hasten or west,

Our remarks from the end of the 14th century have been
confined to the standard or literary form of English, for of the
other dialects from that date (with the exception of the northern
English in Scotland, where it became in a social and literary sense a distinct language), we have little history. We know, however, that they continued to exist as local and popular forms of speech, as well from occasional specimens and from the fact that they exist still as from the statements of writers during the interval. Thus Puttenham in his *Arts of English Poesie* (1589) says:

“Our make [i.e. poet] therefore at these days shall not follow Piers Plowman, nor Gower, nor Lydgate, yet not Chaucer, for their language is now not of use with us: neither shall he take the terms of Northern-men, such as they use in dayly talke, whether they be noblemen, or gentlemen, or of their clares, all is a new matter; nor in effect any speach used beyond the river of Trent, though no man can deny but that theirs is the purer English Saxon and Anglian: Our Courtly poet as our Southern as our South-western is, no more is the far Western mans speach: ye shall therefore take the usual speach of the Court, and that of London and the shires lying about London within six miles, and not much above. I say not this but that in every shire of England there be gentlemen and others that speake but specially write as good Southerne as we of Middlesex or Surrey doe, but not the common people of every shire, to the gentlemen, and also ther is no man that most part condescend, but herein we are already ruled by th’ English Dictionaries and other books written by learned men.”—Arber’s *Repript*, p. 157.

In comparatively modern times there has been a revival of interest in these forms of English, several of which following in the wake of the revival of Lowland Scots in the 18th and 19th centuries, have produced a considerable literature in the form of local poems, tales and “folk-lore.” In these respects Cumberland, Lanarkshire, Kirkcudbright, and Roxburgh, where the dialect was felt to be so independent of literary English as not to be branded as a mere vulgar corruption of it, stand prominent. More recently the dialects have been investigated philologically, a department in which, as in other departments of English philology, the elder Richard Garnett must be named as a pioneer. The work was carried out zealously by Prince Louis Lucien Bonaparte and Dr A. J. Ellis, and more recently by the English Dialect Society, founded by the Rev. Professor Skeat, for the investigation of this branch of philology. The efforts of this society resulted in the compilation and publication of glossaries or word-books, more or less complete and trustworthy, of most of the local dialects, and in the production of grammars dealing with the phonology and grammatical features of a few of these, among which that of the Windhill dialect in Yorkshire, by Professor Joseph Wright, and that of West Somerset, by the late F. T. Elworthy, deserve special mention. From the whole of the glossaries of the Dialect Society, and from all the earlier dialect works of the 18th and 19th centuries, amplified and illustrated by the contributions of local collaborators in nearly every county in British Isles, Dr Ellis has constructed his *English Dialect Dictionary*, recording the local words and senses, with indication of their geographical range, their pronunciation, and in most cases with illustrative quotations or phrases. To this he has added an *English Dialect Grammar*, dealing very fully with the phonology of the dialects, showing the various sounds which now represent each Old English sound, and endeavouring to define the area over which each modern form extends; the accent is treated more summarily, without giving immediately into that of each dialect-group, for which special dialect grammars must be consulted. The work has also a very full and valuable index of every word and form treated.

The researches of Prince L. L. Bonaparte and Dr Ellis were directed specially to the classification and mapping of the existing dialects, and the relation of these to the dialects of Old and Middle English. They recognized a *Northern* dialect lying north of a line drawn from Morecambe Bay to the Humber, which, with the kindred Scottish dialects (already investigated and classed), is the direct descendant of early northern English,

1 See description and map in *Trans. of Philol. Soc.*, 1875-1876, p. 570.

and a *South-western* dialect occupying Somerset, Wilt, Dorset, Gloucester and western Hampshire, which, with the *Devonian* dialect beyond it, are the descendants of early southern English and the still older West-Saxon of Alfred. This dialect must in the 14th century have been spoken everywhere south of Thames; but the influence of London caused its extinction in Surrey, Sussex and Kent, so that already in Puttenham it had become “far western.” An *East Midland* dialect, extending from south Lincolnshire to London, occupies the cradle-land of the standard English speech, and still shows least variation from it. Between and around these typical dialects are ten others, representing the old Midland proper, or dialects between it and the others already mentioned. Thus “north of Trent” the *North-western* dialect of south Lancashire, Cheshire, Derby and Stafford, with that of Shropshire, represents the early West Midland English, of which several specimens remain; while the *North-eastern* of Nottingham and north Lincolnshire represents the dialect of the *Lay of the Last* With the *North Midland* dialect of south-west Yorkshire, these represent forms of speech which to the modern Londoner, as to Puttenham, are still decidedly northern, though actually intermediate between northern proper and midland, and preserving interesting traces of the midland pronouns and verbal inflexions. There is an *Eastern* dialect in the East Anglian counties; a *Midland* in Leicester and Warwickshire; a *Western* in Hereford, Worcestershire and Gloucestershire; an *Intermediate* between south-western and north-western, and *South-eastern* intermediate between south-western and north-western, and representing the dialect of *Piers Plowman*. Finally, between the *east midland* and south-western, in the counties of Buckingham, Oxford, Berks, Hants, Surrey and Sussex, there is a dialect which must have once been south-western, but of which the most salient characters have been rubbed off by proximity to London and the *East Midland* speech. In east Sussex and Kent this *South-eastern* dialect attains to a more distinctive character. The *Kentish* form of early Southern English evidently maintained its existence more strongly than that of the counties immediately south of London. It was very distinct in the days of Sir Thomas More; and even, as we see from the dialect attributed to Edgar in *Lear*, was still strongly marked in the days of Shakespeare. In the south-eastern corner of Ireland, in the baronies of Firth and Bally, in county Westf, a very archaic form of English, of which specimens have been preserved, was still spoken in the 18th century. In all probability it dated from the first English invasion. In many parts of Ulster forms of Lowland Scotch dating to the settlement under James I. are still spoken; but the English of Ireland generally seems to represent 16th and 17th century English, as in the pronunciation of *tea, wheat (jay), whale*, largely affected, of course, by the native Celtic. The subsequent work of the English Dialect Society, and the facts set forth in Dr Ellis’s *Dialect Dictionary*, confirm the general view that the classification of Bonaparte and Ellis; but they bring out strongly the fact that only in a few cases can the boundary between dialects now be determined by precise lines. For every dialect there is a central region, larger or smaller, in which its characteristics are at a maximum; but towards the edges of the area these become mixed and blended with the features of the contiguous dialects, so that it is often impossible to define the point at which the one dialect ends and the other begins. The fault that the various forms of the dialect, whether its distinctive words, characteristic pronunciations or special grammatical features, though they may have the same centre, have not all the same circumference. Some of them extend to a certain distance round the centre; others to a much greater distance. The only approximately accurate way to map the area of any dialect, whether in England, France, Germany or elsewhere, is to take a well-chosen set of its characteristic features—words, sounds, or grammatical peculiarities—and draw a line on the map over the area which each of these extends; between the innermost and outermost of these there will often be a large border district. If the same process be followed with the contiguous dialects,

The vertical lines represent the four leading forms of English—*Northern*, *Midland*, *Southern*, and *Kentish*—and the names occurring down the course of each are those of writers and works in that form of English at the given date. The thickness of the line shows the comparative literary position of this form of speech at the time; thick indicating a literary language; medium, a literary dialect; thin, a popular dialect or patois; a dotted line shows that this period is unrepresented by specimens. The horizontal lines divide the periods; these (after the first two) refer mainly to the Midland English; in inflectional decay the Northern English was at least a century in advance of the Midland, and the Southern nearly as much behind it.
it will be found that some of the lines of each intersect some of the lines of the other, and that the passing of one dialect into another is not effected by the formation of intermediate or blended forms of any one characteristic, but by the overlapping or intersecting of more or fewer of the features of each. Thus a definite border village or district may use 10 of the 20 features of dialect A and 10 of those of B, while a village on the one side has 12 of those of A and 8 of those of B, and one on the other side has 8 of A with 13 of those of B. Hence a dialect boundary line can at best indicate the line within which the dialect has, on the whole, more of the features of A than of B or C; and usually no single line can be drawn as a dialect boundary, but that without it there are some features of the same dialect, and within it some features of the contiguous dialects.

Beyond the limits of the British Isles, English is the language of extensive regions, now or formerly colonized. In all these countries the presence of numerous new objects and new conditions of life has led to the supplementing of the vocabulary by the adoption of words from native languages, and special adaptation and extension of the sense of English words. The use of these languages, however, prevents the evolution of these local peculiarities, and also makes them more or less familiar to the Englishmen at home. It is in the old states of the American Union that anything like a local dialect has been preserved, or in the so-called Americanisms are quite as much archaic English forms which have been lost or have become dialectal in England as developments of the American soil.

The steps by which English, from being the language of a few thousand invaders along the eastern and southern seaboard of Britain, has been diffused by conquest and colonization over its present area form a subject too large for the limits of this article. It need only be remarked that within the confines of Britain itself, the process is not yet complete. Representatives of earlier languages survive in Wales and the Scottish Highlands, though in neither case can the substitution of English be very remote. In Ireland, where English was introduced by conquest much later, Irish is still spoken in patches all over the country; though English is understood, and probably spoken after a fashion, almost everywhere. At opposite extremities of Britain, the Cornish of Cornwall and the Norse dialects of Orkney and Shetland died out very gradually in the course of the 18th century. The Manx, or Celtic of Man, is even now in the last stage of dissolution; and in the Channel Isles the Norman (palais of Jersey and Guernsey have largely yielded to English.

The table on p. 599 (a revision of that brought before the Philological Society in Jan. 1876) graphically presents the chronological and dialectal development of English. Various names have been proposed for the different stages; it seems only necessary to add to those in the table the descriptive names of Dr Abbott, who has proposed (How to Parse, p. 298) to call the Old English, or Anglo-Saxon, the "Synthetic or Inflectional Period"; the Old English Transition (Late Anglo-Saxon of Dr Skeat), the "Period of Confusion"; the Early Middle English, "Analytical Period" (1250-1350); the normal Middle English, "National Period" (1350-1500); the Tudor English, "Period of Licence"; and the Modern English, "Period of Settlement."
ENGLISH LAW

Digest. In the Occident the time for the Germanic "folk-laws" (Leges Barbarorum) had come, and a Canon law, ambitious of independence, was being constructed, when in the Orient the lord of church and state was "enucleating" all that was to live of the classical jurisprudence of pagan Rome. It was but a brief interval between Gothic and Lombardic domination that enabled him to give law to Italy; Gaul and Britain were beyond his reach.

The Anglo-Saxon laws that have come down to us (and we have no reason to fear the loss of much beyond some dooms of the Mercian Offa) are best studied as members of a large Teutonic family. Those that proceed from the Kent and Wessex of the 7th century are closely related to the continental folk-laws. Their next of kin seem to be the Lex Saxorum and the laws of the Lombards. Then, though the 8th and 9th centuries are unproductive, we have from Alfred (c. 900) and his successors a series of edicts which strongly resemble the Frankish capitularies—so strongly that we should see a clear case of imitation, were it not that in Frankland the age of legislation had come to its disastrous end long before Alfred was king. This, it may be noted, gives to English legal history a singular continuity from Alfred's day to the present. The king of the West Saxons has the right to publish laws at a time when hardly any one else was attempting any such feat, and the English dooms of Canute the Dane are probably the most comprehensive statutes that were issued in the Europe of the 11th century. No genuine laws of the sainted Edward have descended to us, and during his reign England seems but too likely to follow the bad example of Frankland, and become a loose congeries of lordships. From this fate it was saved by the Norman duke, who, like Canute before him, subdued a land in which kings were not expected to publish laws.

In the study of early Germanic law—a study which now for some considerable time has been scientifically prosecuted in Germany—the Anglo-Saxon dooms have received their due share of attention. A high degree of racial purity may be claimed on their behalf. Celtic elements have been sought for in them, but have never been detected. At certain points, notably in the regulation of the blood-feud and the construction of a tariff of atonements, the law of one rude folk will always be somewhat like the law of another; but the existing remains of old Welsh and old Irish law stand far remote from the dooms of Æthelberht and Ine than stand the edicts of Rothari and Liutprand, kings of the Lombards. Indeed, it is very dubious whether distinctively Celtic customs play any considerable part in the evolution of that system of rules of Anglian, Scandinavian and Frankish origin which becomes the law of Scotland. While its own, it is true, was fighting enough between the various Germanic folks, the tribal distinctions were not so deep as to prevent the formation of a common language and a common law. Even the strong Scandinavian strain seems to have rapidly blended with the Anglian. It amplified the language and the law, but did not permanently divide the country. If, for example, we can to-day distinguish between law and right, we are debtors to the Danes; but very soon law is not distinctive of eastern or right of western England. In the first half of the 13th century a would-be exponent of the law of England had still to say that the country was divided between the Wessex law, the Mercian law, and the Danes' law, but he had also to point out that the law of the king's own court stood apart from and above all partial systems. The local customs were those of shires and hundreds, and shaded off into each other. We may speak of more Danish and less Danish counties; it was a matter of degree; for rivers were narrow and hills were low, and the sea nature meant by nature to be the land of one law.

Then as to Roman law. In England and elsewhere Germanic law developed in an atmosphere that was charged with traditions of the old world, and many of these traditions had become implicit in the Christian religion. It might be argued that all that we call progress is due to the influence exercised by Roman civilization; that, were it not for this, Germanic law would never have been set in writing; and that theoretically unchangeable custom would never have been supplemented or superseded by express legislation. All this and much more of the same sort might be said; but the survival in Britain, or the reintroduction into England, of anything that we should dare to call Roman jurisprudence would be a different matter. Eyes, carefully trained, have minutely scrutinized the Anglo-Saxon legal texts without finding the least trace of a Roman rule outside the ecclesiastical sphere. Even within that sphere modern research is showing that the church-property-law of the middle ages, the law of the ecclesiastical "benefice," is permeated by Germanic ideas. This is true of Gaul and Italy, and yet truer of an England in which Christianity was for a while extinguished. Moreover, the laws that were written in England were, from the first, written in the English tongue; and this gives them a unique value in the eyes of students of Germanic folk-law, for even the very ancient and barbarous Lex Salica is a Latin document, though many old Frankish words are ensnared in it. Also we notice—and this is of grave importance—that in England there are no vestiges of any "Romani" who are being suffered to live under their own law by their Teutonic rulers. On the Continent we may see Gundobad, the Burgundian, publishing one law-book for the Burgundians and another for the Romani. The Roman Lex Romana and Lex Austrasia are modified from the Theodosian code, was issued by Alaric the Visigoth for his Roman subjects before the days of Justinian, and this book (the so-called Breviarium Alarici or Lex Romana Visigothorum) became for a long while the chief representative of Roman law in Gaul. The Frankish king in his expansive realm ruled over many men whose law was to be found not in the Lex Salica or Lex Ribuaria, but in what was called the Lex Romana. "A system of personal law" prevailed: the homo Romanus handed on his Roman law to his children, while Frankish or Lombardic, Swabian or Saxonic law would run in the blood of the homo barbarus. Of all this we hear nothing in England. Then on the mainland of Europe Roman and barbarian law could not remain in juxtaposition without affecting each other. On the one hand we see distinctively Roman rules making their way into the law of the victorious tribes, and on the other hand we see a decay and debasement of jurisprudence which ends in the formation of what modern historians have called a Roman "vulgar-law" (Vulgarrecht). For a short age which centres round the year 800 it seemed possible that Frankish kings, who were becoming Roman emperors, would be able to rule by their capitularies nearly the whole of the Christian Occident. The dream vanished before fratricidal wars, heathen invaders, centrifugal feudalism, and a centripetal church which found its laws in the newly concocted forgeries of the Pseudo-Isidor (c. 850). The "personal law" could not be translated into these two into local customs, and the Roman vulgar-law began to look like the local laws of those districts where the Romani were the preponderating element in the population. Meanwhile, the Norse pirates subdued a large tract of what was to be northern France—a land where Romani were few. Their restless and boundless vigour these Normans retained; but they showed a wonderful power of appropriating whatever of alien civilization came in their way. In their language, religion and law, they had become French many years before they subdued England. It is a plausible opinion that among them there lived some sound traditions of the Frankish monarchy's best days, and that Norman dukes, rather than German emperors or kings, of the French, are the truest spiritual heirs of Charles the Great.

In our own day German historians are wont to speak of English law as a "daughter" of French or Frankish law. This tendency derived its main impulse from H. Brunner's proof that the germ mental by jurists which cannot be found in the Anglo-Saxon legal texts can be found in the procedure of the Frankish kings. We must here remember that during a long age English lawyers wrote in French and even thought in French, and that to this day most of the technical terms of the law, more especially of the private law, are of French origin. Also it must be allowed that when English law has taken shape in the 13th century it is very like one of the coutumes of northern France. Even when linguistic difficulties have been surmounted, the Saxon Mirror
of Eike von Rerpog will seem far less familiar to an Englishman
than the so-called Establishments of St Louis. This was the
outcome of a slow process which fills more than a century (1066–
1180), and was in a great measure due to the reforming energy
of Henry II. The French writers, who, in addition to England,
ruled a good half of France. William the Conqueror may have
intended to govern Englishmen by English law. After
the tyranny of Rufus, Henry I. promised a restoration of King
Edward's law: that is, the law of the Confessor's time (Lagam
Eadwardi regis tribis reddo). Various attempts were then made,
mostly, so it would seem, by men of French birth, to
state in a modern and practicable form the lega
Eadwardi which was thus restored. The result
of their labours is an intricate group of legal tracts which has been
explored of late years by Dr Liebermann. The best of these
has long been known as the Leges Henrici Primi, and aspires to
be a comprehensive law-book. Its author, though he had
some foreign sources at his command, such as the Lex Riburiae
and an epitome of the Breviary of Alaric, took the main part of
his matter from the code of Canute and the older English dooms.
Neither the Conqueror nor either of his sons had issued many
criminal statutes. King Edward I., however, had little, if any, written
law to bring with them, and had invaded a country where kings
had been lawgivers. Moreover, there was much in the English
system that the Conqueror was keenly interested in retaining—
especially an elaborate method of taxing the land and its holders.
The greatest product of Norman government, the grandest feat
of government that the world had seen for a long time past,
the compilation of Domestacy Book, was a conservative effort,
an attempt to fix upon every landholder, French or English, the
amount of gold that was due from his predecessor in title. He
himself the rebellious vassal of the French king, the duke of
the Normans, who had become king of the English, knew much
of disruptive feudalism, and had no mind to see England that
other France which it had threatened to become in the days of
his pious but incompetent cousin. The sheriffs, though called
vice-comites, were to be the king's officers; the shire-moots might
call county courts, but were not to be the courts of counts.
Much that was sound and royal in English public law was to
be preserved if William could preserve it.

The gulf that divides the so-called Leges Henrici (c. 1115)
from the text-book ascribed to Ranulf Glanvill (c. 1188) seems
at first sight very wide. The one represents a not
easily imaginable chaos and clash of old rules and
new; it represents also a stage in the development of
feudalism which in other countries is represented chiefly by
a significant survival of other rules of order; rational, legal book,
which through all the subsequent centuries will be readily understood
by English lawyers. Making no attempt to tell us what
goes on in the local courts, its author, who may be Henry II.'s
chief Justiciar, Ranulf Glanvill, or may be Glanvill's nephew,
Hubert Walter, fixes our attention on a novel element which is
beginning to subdue all else to its powerful operation. He
speaks to us of the justice that is done by the king's own court. Henry
II. had opened the doors of his French-speaking court to
the mass of his subjects. Judges chosen for their ability were to
sit there, term after term; judges were to travel in circuits
through the land, and in many cases the procedure by way of
"an inquest of the country," which the Norman kings had used
for the ascertainment of their fiscal rights, was to be at the
disposal of ordinary litigants. All this had been done in
a piecemeal, experimental fashion by ordinances that were known
as "assizes." There had not been, and was not to be, any
organization of a general principle or order; a system, rational, which
brought in their own words their complaints to the king's
audience. The general prevalence of feudal justice, and of the
world-old methods of supernatural probation (ordeals, battle,
oaths sworn with oath-helpers), was to be theoretically respected;
but in exceptional cases, which would soon begin to devour the
rule, a royal remedy was to be open to any one who could frame
his case within the compass of some carefully-worded and
prescript formula. With allusion to a remote stage in the history
of Roman law, a stage of which Henry's advisers can have known
little or nothing, we may say that a "formulary system" is
established which will predate over English law until modern
times. Certain actions, each with a name of its own, are open
to litigants. Each has its own formula set forth in its original
and, what might say, original procedure and its appropriate mode of trial. The litigant chooses
his writ, his action, and must stand or fall by his choice. Thus
a book about royal justice tends to become, and Glanvill's book
already is, a commentary on original writs.

The precipitation of English law in so coherent a form as that
which it has assumed in Glanvill's book is not to be explained
without reference to the revival of Roman jurisprudence in
Italy. Out of a school of Lombard lawyers at Pavia had come
Lanfranc the Conqueror's adviser, and the Lombardists had
already been studying Justinian's Institutes. Then at length
the Digest came by its rights. About the year 1140
Inerius was teaching at Bologna, and from all parts of the West
men were eagerly flocking to hear the new gospel of civilization.
About the year 1149 Vacarius was teaching Roman law in
England. The rest of a long life he spent here, and faculties of
Roman and Canon law took shape in the nascent university of
Oxford. Whatever might be the fate of Roman law in England,
there could be no doubt that the Canon law, which was crystal-
lizing in the Decretum Gratiani (c. 1139) and in the decretales
of Alexander III., would be the law of the English ecclesiastical
tribunals. The great quarrel between Henry II. and Thomas of
Canterbury brought this system into collision with the temporal
law of England, and the king's ministers must have seen that
they had much to learn from the methodic enemy. Some of
them were able men who became the justices of Henry's court,
and bishops to boot. The luminous Dialogue of the Exchequer
(c. 1170), which expounds the English fiscal system, came from
the treasurers, Richard Fitz Nigel, who became bishop of London;
and the treatise on the laws of England came perhaps from
Glanvill, perhaps from Hubert Walter, who was to be both
primate and chief justiciar. There was healthy emulation of
the work that was being done by Italian jurists, but no meek
acceptance of foreign results.

A great constructive era had opened, and its outcome was a
large and noble book. The author was Henry of Bracton (his
name has been corrupted into Bracton), who died in
1268 after having been for many years one of Henry
III.'s justices. The model for its form was the treatise of Azo
of Bologna ("master of all the masters of the laws," an Englishman
called him), and thence were taken many of the generalities
of jurisprudence; maxims that might be regarded as of universal
and natural validity. But the true core of the work was the
practice of an English court which had yearly been extending
its operations in many directions. For half a century past
diligent record had been kept on parchment of all that this court
had done, and from its rolls Bracton cited numerous decisions.
He cited them as precedents, paying special heed to the judgments
of two judges who were already dead, Martin Pateshull and
William Raleigh. For this purpose he compiled a large Note
Book, which was discovered by Prof. Vinogradoff in the British
Museum in 1884. Thus at a very early time English "common
law" shows a tendency to become what it afterwards definitely
became, namely, "case law." The term "common law" was
being taken over from the canonists by English lawyers, who
used it to distinguish the general law of the land from local
customs, royal prerogatives, and in short from all that was
exceptional or special. Since statutes and ordinances (at will
or originating) were excluded from the English lawyers' notion of "the common law." The Great
Charter (1215) had taken the form of a grant of "liberties and
privileges," comparable to the grants that the king made to
individual men and favoured towns. None the less, it was in
that age no small body of enacted law, and, owing to its import-
ance and solemnity, it was in after ages regarded as the first
article of a statute book. There it was followed by the "pro-
visions" issued at Merton in 1236, and by those issued at

Bračian.
Marlborough after the end of the Barons' War. But during Henry III.'s long reign, the swift development of English law was due chiefly to new "original writs" and new "forms of action" devised by the chancery and sanctioned by the court. Bracton knew many writs that were unknown to Glanvil, and men were already perceiving that limits must be set to the inventive power of the chancery unless the king was to be an uncontrollable law-maker. Thus the common law was losing the power of rapid growth when Bracton summed the attained results in a book, the success of which is attested by a crowd of manuscript copies. Bracton had introduced just enough of Roman law and Bolognese method to save the law of England from the fate that awaited German law in Germany. His book was printed in 1569, and Coke owed much to Bracton.

The comparison that is suggested when Edward I. is called the English Justinian cannot be pressed very far. Nevertheless, as is well known, it is in his reign (1275-1307) that English institutions finally take the forms that they are to keep through coming centuries. We already see the parlement of the three estates, the convocations of the clergy, the king's council, the chancery or secretarial department, the exchequer or financial department, the king's bench, the common bench, the commissioners of assize and gaol delivery, the small group of professionally learned judges, and a small group of professionally learned lawyers, whose skill is at the service of those who will employ them. Moreover, the statutes that were passed in the first half of the reign, and in the bulk of the statutes that were passed in the second half of the reign, were so framed that their purport endured. And all this time the law and its administration were developing, and the judges were advising the king. Coke commented upon them sentence by sentence, and even now the merest smatterer in English law must profess some knowledge of Quaestiones and De donis conditionalibus. If some American states have, while others have not, accepted these statutes, that is a difference which is not unimportant to citizens of the United States in the 18th century. Then from the early years of Edward's reign come the first "law reports" that have descended to us: the oldest of them have not yet been printed; the oldest that has been printed belongs to 1292. These are the precurors of the long series of Year Books (Edw. II.-Hen. VIII.) which runs through the residue of the middle ages. Lawyers, we perceive, are already making and preserving notes of the discussions that take place in court; French notes that will be more useful to them than the formal Latin records inscribed upon the plea rolls.

From these reports we learn that there are already, as we should say, a few "leading counsel," some of whom will be retained in almost every important cause. Papal decretales had been endeavouring to withdraw the clergy from secular employment. The clerical element had been strong among the judges of Henry III.'s reign: Bracton was an archdeacon, Patehull a dean, Raleigh died a bishop. Their places begin to be filled by men who are not in orders, but who have pleased the king's causes for him — his sergeants or servants at law — and beside them there are young men who are "apprentices at law," and are learning to plead. Also we begin to see men who, as "attorneys at law," are making it their business to appear on behalf of litigants. The history of the legal profession and its monopoly of legal aid is intricate, and at some points still obscure; but the influence of the canonical system is evident: the English attorney corresponds to the canonical proctor, and the English barrister to the canonical advocate. The main outlines were being drawn in Edward I.'s day; the legal profession became organic, and professional opinion became one of the main forces that moulded the law.

The study of English law fell apart from all other studies, and the impulse that had flowed from Italian jurisprudence was ebbing. We have two comprehensive text-books from Edward's reign: the one known to us as Bracton, the other as Horae; of them, however, quary their materials from Bracton's treatise. Also we have two little books on procedure which are attributed to Chief-Justice Hengham, and a few other small tracts of an intensely practical kind. Under the cover of fables about King Alfred, the author of the Mirror of Justices made a bitter attack upon King Edward's judges, some of whom had fallen into deep disgrace. English legal history has hardly yet been purged of the leaven of falsehood that was introduced by this fantastic and unscrupulous pamphleteer. His enigmatical book ends that literature age which begins with Glanvil's treatise and the treasurer's dialogue. Between Edward I.'s day and Edward IV.'s hardly anything that deserves the name of book was written by an English lawyer.

During that time the body of statute law was growing, but not very rapidly. Acts of parliament intervened at a sufficient number of important points to generate and maintain a persuasion that no limit, or no ascertainable limit, can be set to the legislative power of king and parliament. Very few are the signs that the judges ever permitted the validity of a statute to be drawn into debate. Thus the way was being prepared for the definite assertion of parliamentary "omnicompetence" which we obtain from the Elizabethan statesman Sir Thomas Smith, and for those theories of sovereignty which we couple with the names of Hobbes and Austin. Nevertheless, English law was being developed rather by debates in court than by open legislation. The most distinctively English of English institutions in the later middle ages are the Year-Books and the Inns of Court. Year by year, term by term, lawyers were reporting cases in order that they and their fellows might know how cases had been decided. The authorities which obtained in the chancery were thus modified and became our books. The practice that it afterwards became, and no calculus of authority so definite as that which now obtains had been established in Coke's day, far less in Littleton's. Still it was by a perusal of reported cases that a man would learn the law of England. A skeleton for the law was provided, not by the Roman rubrics (such as public and private, real and personal, possessory and proprietary, contract and delict), but by the cycle of original writs that were used in the chancery's registry. Bracton, as it has been suggested, could not be introduced without the authority of Parliament, and the growth of the law took the shape of an explication of the true intent of ancient formulas. Times of inventive liberality alternated with times of cautious and capacious conservatism. Coke could look back to Edward III.'s day as to a golden age of good pleading. The otherwise miserable time which saw the Wars of the Roses produced some famous lawyers, and some legal doctrines which broke new ground. It produced also Sir Thomas Littleton's (d. 1481) treatise on Tenures, which (though it be not, as Coke thought it, the most perfect work that ever was written in any human science) is an excellent statement of law in exquisitely simple language.

Meanwhile English law was being scholastically taught. This, if we look at the fate of native and national law in Germany, or France, or Scotland, appears as a fact of primary importance. From beginnings, so small and formless as Legal education, that they still elude research, the Inns of Court had grown. The lawyers, like other men, had grouped themselves in gilds, or gild-like "fellowships." The fellowship acquired property; it was not technologically incorporate, but made use of the thoroughly English machinery of a trust. Behind a hedge of trustees it lived an autonomous life, unhampere by charters or statutes. There was a hall in which its members dined in common; there was the nucleus of a library; there were also dormitories or chambers in which during term-time lawyers lived celibately, leaving their wives in the country. Something of the college thus enters the constitution of these fellowships; and then something academic. The craft gild regulated apprenticeship; it would protect the public against incompetent artificers, and its own members against unfair competition. So the fellowship of lawyers. In course of time a lengthy and laborious course of education of the medieval sort had been devised. He who had paid for it, and received a call to the bar of his inn. This call was in effect a degree. Like the doctor or master of a university, the full-blown barrister was competent to teach others, and was expected to read lectures to students. But further, in a manner that is still very dark, these societies
had succeeded in making their degrees the only steps that led to practice in the king's courts. At the end of the middle ages (c. 1470) Sir John Fortescue rehearsed the praises of the laws of England in a book which is one of the earliest efforts of compatriotic politics. Contrasting England with France, he rightly connects limited monarchy, public and oral debate in the law courts, trial by jury, and the teaching of national law in schools that are thronged by wealthy and well-born youths. But nearly a century earlier, the assertion that English law affords a sublime and superior frame as an art as well as an instrument of civil government in all its parts that had been learned and taught under the law was made by a man no less famous than John Wycliffe. The heresiarch naturally loathed the Canon law; but he also spoke with reprobation of the "payments' law," the "heathen men's law," the study of which in the two universities was being fostered by some of the bishops. That study, after inspiring Bracton, had come to little in England, though the canonist was compelled to learn something of Justinian, and there was a small demand for learned civilians in the court of admiralty, and in what we might call the king's diplomatic service. No medieval Englishman did anything considerable for Roman law. Even the canonists were content to read the books of French and Italian masters, though John Acton (c. 1340) and William Lyndwood (1430) wrote meritorious glosses. The Angevin kings, by appropriating to the temporal forum the whole province of ecclesiastical patronage, had robbed the decreets of an inextinguishable source of divinity and fear. To work the theocratic system, as had Oxford and Cambridge, is slight when compared with the inestimable services rendered to the cause of national continuity by the schools of English law which grew within the Inns of Court.

A danger threatened: the danger that a prematurely osseous system of common law would be overwhelmed by summary justice and royal equity. Even when courts for all ordinary causes had been established, a reserve of residuary justice remained with the king. What the law had done by the king's council upon misdeemansants, and extraordinary justice of a civil kind was ministered by the king's chancellor (who was the specially learned member of the council) to those who "for the love of God and in the way of charity," craved his powerful assistance. It is now well established that the chancellors started upon this course, not with any desire to introduce rules of "equity" which should supplement, or perhaps supplant, the rules of law, but for the purpose of driving the law through those incidental impediments which sometimes unfortunately beset its due course. The wrongs that the chancellor redressed were often wrongs of the simplest and most brutal kind: assaults, batteries and forcible dispossessions. However, he was warned off this field of activity by parliament; the danger to law, to lawyers, to trial by jury, was evident. But just when this was happening, a new field was being opened for him by the growing practice of conveying land to trustees. The English trust of land had ancient Germanic roots, and of late we have been learning how in far-off centuries our Lombard cousins were in effect giving themselves a power of testament by putting their lands in trust. In England, when the forms of action were crystallizing, this practice had not been common enough to obtain the protection of a writ; but many causes conspired to make it common in the 14th century; and so, with the general approval of lawyers and laity, the chancellors began to enforce by summary process against the trustee the duty that lay upon his conscience. In the next century it was clear that England had come by a new civil tribunal. Negatively, its competence was defined by the rule that when the common law offered a remedy, the chancellor was not to intervene. Positively, his power was conceived as that of doing what "good conscience" required, more especially in cases of "fraud, accident or breach of confidence." His procedure was the summary, the heresy-suppressing (not the ordinary and solemn) procedure of an ecclesiastical court; but there were few signs that he borrowed any substantive rules from legist or decretist, and many proofs that within the new field of trust he pursued the ideas of the common law. It was long, however, before lawyers made a habit of reporting his decisions. He was not supposed to be tightly bound by precedent. Adapting the practice of the chancellory to the needs of the new judges, he introduced the oath.

A time of strain and trial came with the Tudor kings. It was questionable whether the strong "government" for which the weary nation yearned could work within the limits of a parliamentary system, or would be compatible with the preservation of the common law. We see new courts appropriating large fields of justice and proceeding summarie et de plano; the star chamber, the chancery, the courts of requests, of wards, of augmentations, the councils of the North and Wales; a little later we see the high commission. We see also that judicial torture which Fortescue had called the road to hell. The stream of law reports became intermittent under Henry VIII.; few judges of his or his son's reign left names that are to be remembered. In an age of humanism, alphabetically arranged "abridgments" of medieval cases were the best work of English lawyers: one comes to us from Anthony Fitzherbert (d. 1558), and another from Robert Brooke (d. 1580). This was the beginning of what the French called la marine de femmes. The modern historian of Germany will speak of "the Reception" (that is, the reception of Roman law), as no less important than the Renaissance and Reformation with which it is intimately connected. Very probably he will bestow hard words on a movement which disintegrated the nation and consolidated the tyranny of the princelings. Now a project that Roman law should be "received" in England occurred to the statesman Sir Thomas Pole (d. 1585), a humanist, and at one time a reformer who with good fortune might have been either king of England or pope of Rome. English law, said the future cardinal and archbishop, was barbarous; Roman law was the very voice of nature pleading for "civility" and good princely governance. Pole's words were brought to the ears of his majestic cousin, and, had the course of events been somewhat other than it was, King Henry might well have decreed a reception. The role of English Justinian would have perfectly suited him, and there are distinct traces of the civilian's Byzantinism in the doings of England's supreme head. The academic study of the Canon law was prohibited; regius professorships of the civil law were founded; civilians were to sit as judges in the ecclesiastical courts. A little later, the Protector Somerset was deeply interested in the establishment of a great school for civilians at Cambridge. Scottish law was the own sister of English law, and yet in Scotland we may see a reception of Roman jurisprudence which might have been more whole-hearted than it was, but for the drift of two British and Protestant kingdoms towards union. As it fell out, however, Henry could get what he wanted in church and state without any decisive supersession of English by foreign law. The omnibeneence of an act of parliament stands out the more clearly if it settles the succession to the throne, annuls royal marriages, forgives royal debts, defines religious creeds, attains guilty or innocent nobles, or prospectively lends the force of statute to the king's proclamations. The courts of common law were suffered to work in obscurity, for jurors feared fines, and matter of state was reserved for council or star chamber. The Inns of Court were spared; their moots and readings did no perceptible harm, little perceptible good.

Yet it is no reception of alien jurisprudence that must be chronicled, but a marvellous resuscitation of English medieval law. We may see it already in the Commentaries of Edward d. 1568) who reported cases at length and lovingly. Bracton's great book was put in print, and was a key to much that had been forgotten or misunderstood. Under Parker's patronage, even the Anglo-Saxon dooms were brought to light; they seemed to tell of a Church of England that had not yet been
enslaved by Rome. The new national pride that animated Elizabethan England issued in boasts touching the antiquity, humanity, enlightenment of English law. Resuming the strain of Fortescue, Sir Thomas Smith, himself a civilian, wrote concerning the Commonwealth of England a book that claimed the attention of foreigners for her law and her polity. There was dignified rebuke for the French jurist who had dared to speak lightly of Littleton. And then the common law took flesh in the person of Edward Coke (1552-1634). With an enthusiastic love of English tradition, for the sake of which many offences may be forgiven him, he ranged over nearly the whole field of law, commenting, reporting, arguing, deciding—disorderly, pedantic, masterful, an incarnate national dogmatism tenacious of continuous life. Immuted with this new spirit, the lawyers fought the battle of the constitution against James and Charles, and historical research appeared as the guardian of national liberties. That the Stuarts united against themselves three such men as Edward Coke, John Selden and William Prynne, is the measure of their folly and their failure. Words that, rightly or wrongly, were ascribed to Bracton rang in Charles's ears when he was sent to the scaffold. For the modern student of medieval law many of the reported cases of the Stuart time are storehouses of valuable material, since the lawyers of the 17th century were mighty hunters after records. Prynne (d. 1669), the fanatical Puritan, published ancient documents with fervid zeal, and made possible a history of parliament. Selden (d. 1654) was in all Europe among the very first to write legal history as it should be written. His book about tithes is to this day a model and a masterpiece. When this accomplished scholar had declared that he had laboured to make himself worthy to be called a common lawyer, it could no longer be said that the common lawyers were "indocississimum genus docissimorum hominum." Even pliant judges, whose tenure of office depended on the king's will, were compelled to cite and discuss old precedents before they could gain as much for their master; and even at their worst moments they would not openly break with medieval tradition, or declare in favour of that "modern police-state" which has too often become the ideal of foreign publicists trained in Byzantine law.

The current of legaldoctrine was by this time so strong and voluminous that such events as the Civil War, the Restoration and the Revolution hardly deflected the course of the stream. In retrospect Charles II, "palladium of the English constitution" and "the backbone of the nation," was soon as life has left his father's body, and James II. ends a lawless career by a considerate and convenient abdication. The statute book of the restored king was enriched by leaves excerpted from the acts of a lord protector; and Matthew Hale (d. 1676), who was, perhaps, the last of the great record-searching judges, sketched a map of English law which Blackstone was to colour. Then a time of self-complacency came for the law, which knew itself to be the perfection of wisdom, and any proposal for drastic legislation would have worn the gag discredited by the tyranny of the Puritan Caesar. The need for the yearly renewal of the Mutiny Act secured an annual session of parliament. The mass of the statute law made in the 18th century is enormous; but, even when we have excluded from view such acts as are technically called "private," the residuary matter bears a wonderfully empirical, partial and minutely particularizing character. In this "age of reason," as we are wont to think it, the British parliament seems rarely to rise to the dignity of a general proposition, and in our own day the legal practitioner is likely to know less about the statutes of the 18th century than he knows about the statutes of Edward I, Henry VIII. and Elizabeth. Parliament, it should be remembered, was endeavouring directly to govern the nation. There was little that resembled the permanent civil service of to-day. The choice lay between direct parliamentary government and royal "magnetism"; and lengthy statutes did much of that work of detail which would now be done by virtue of the powers that are delegated to ministers and governmental boards. Moreover, extreme and verbose particularity was required in statutes, for judges were loath to admit that the common law was capable of amendment. A vague doctrine, inherited from Coke, taught that statutes might be so unreasonable as to be null, and any political theory that seemed to derive from Hobbes would have been regarded with not unjust suspicion. But the doctrine in question never took tangible shape, and enough could be done to protect the common law by a niggardly exposition of every legislating word. It is to be remembered that some main features of English public law by the common law was attracting the admiration of enlightened Europe. When Voltaire and Montesquieu applauded, the English lawyer had cause for complacency.

The common law was by no means stagnant. Many rules which come to the front in the 18th century are hardly to be traced farther. Especially is this the case in the province of mercantile law, where the ear of Mansfield's (d. 1793) long presidency over the king's bench marked an epoch. It is too often forgotten that, until Elizabeth's reign, England was a thoroughly rustic kingdom, and that trade with England was mainly in the hands of foreigners. Also in medieval fairs, the assembled merchants declared their own "law merchant," which was considered to have a supernormal validity. In the reports of the common law courts it is late in the day before we read of some mercantile usages which can be traced back in the statutes of Italian cities. Even on the basis of the excessively elaborated land law—a basis which Coke's Commentary on Littleton seemed to have settled for ever—a lofty and ingenuous structure could be reared. One after another, delicate devices were invented for the accommodation of new wants within the law; but only by the assurance that the old law could not be frankly abolished can we be induced to admire the subtlety that was thus displayed. As to procedure, it had become a maze of evasive fictions, to which only a few learned men held the historical clue. By fiction the courts had stolen business from each other, and by fiction a few comparatively speedy forslt of actions were set to tasks for which they were not framed. Two fictitious reasons: John Doe and Richard Roe, reigned supreme. On the other hand, that healthy and vigorous institution, the Commission of the Peace, with a long history behind it, was giving an important share in the administration of justice to numerous country gentlemen who were thus compelled to learn some law. A like beneficial work was being done among jurors, who, having ceased to be regarded as witnesses, had become "judges of fact." No one doubted that trial by jury was the "palladium of the English constitution" and "the backbone of the nation," as the powers and popularity awaited those who would exalt the office of the jurors and narrowly limit the powers of the judge.

But during this age the chief addition to English jurisprudence was made by the crystallization of the chancellor's equity. In the 17th century the chancery had a narrow escape of sharing the fate that befell its twin sister the star chamber. Its younger sister the court of requests perished under the persistent attacks of the common lawyers. Having outlived troubles, the chancery took to orderly habits, and administered under the name of "equity" a growing group of rules, which in fact were supplemental law. Stages in this process are marked by the chancellories of Nottingham (1673-1675) and Hardwicke (1737-1756). Slowly a continuous series of Equity Reports began to flow, and still more slowly an "equity bar" began to form itself. The principal outlines of equity were drawn by men who were steeped in the common law. By way of ornament a Roman maxim might be borrowed from a French or Dutch expositor, or a phrase which smacked of that "nature-rightly" which was dominant continental Europe; but the influence exercised by Roman law upon English equity has been the subject of gross exaggeration. Parliament and the old courts being what they were, perhaps it was only in a new court that the requisite new law could be evolved. The result was not altogether satisfactory. Freed from contact with the plain man in the jury-box, the chancellors were tempted to forget how plain and rough good law should be, and to screw up the legal standard of reasonable conduct to a height hardly attainable except by those whose purses could command the constant advice of a family solicitor. A court which started with the
idea of doing summary justice for the poor became a court which did a highly refined, but tardy justice, suitable only to the rich.

About the middle of the century William Blackstone, then a disappointed barrister, began to give lectures on English law at Oxford, and in 1765 his Commentaries. Accurate enough in its history and doctrine to be an invaluable guide to professional students and a useful aid to practitioners, his book set before the unprofessional public an artistic picture of the laws of England such as had never been drawn of any similar system. No nation but the English had so eminently readable a law-book, and it must be doubtful whether any other lawyer ever did more important work than was done by the great professor of English law. Over and over again the Commentaries were edited, sometimes by distinguished men, and it is hardly too much to say that for nearly a century the English lawyer's main ideas of the organization and articulation of the body of English law were controlled by Blackstone. This was far from all. The Tory lawyer little thought that he was giving law to colonies that were on the eve of a great and successful rebellion. Yet so it was. Out in America, where books were few and lawyers had a mighty task to perform, Blackstone's facile presentation of the law of the mother country was of inestimable value. It has been said that among American lawyers the Commentaries "stood for the law of England," and this at a time when the American daughter of English law was rapidly growing in stature, and was preparing herself for her destined march from the Atlantic to the Pacific Ocean. Excising only what seemed to savour of oligarchs, those who had deified George retained with marvellous tenacity the law of their forefathers. Profound discussions of English medieval law have been heard in American courts; admirable researches into the recesses of the Year-Books have been made in American law schools; the names of the great American judges are familiar in an English which knows little indeed of foreign jurists; and the debt due for the loan of Blackstone's Commentaries is being fast repaid. Lectures on the common law delivered by Mr Justice Holmes of the Supreme Court of the United States may even have begun to turn the scale against the old country. No chapter in Blackstone's book nowadays seems more antiquated than that which describes the modest territorial limits of that English law which was soon to spread throughout Australia and New Zealand and to follow the dominant race in India.

Long wars, vast economic changes and the conservatism generated by the French Revolution piled up a monstrous arrear of cases for the English law courts, and the English law courts were the first to feel the blows. The destruction of an ancient order of things was being attempted in an ancient court. The old form of proceeding in an ancient court was to have been reserved for an ancient form of proceeding. The English law courts were to have been the undisturbed guardians of an ancient order of things; but they were not the guardians of an ancient order of things. The new legislation which came into force in the later years of the century was legislation of a modern kind, and the modern lawyer is not a friend to the Norman court. More and more, therefore, the fate of English law depends on the will of parliament, or rather of the ministry. The quality of legal text-books has steadily improved; some of them are models of clear statement and good arrangement; but no one has with any success aspired to be the Blackstone of a new age.

The Council of Law Reporting was formed in the year 1863. The council now consists of three ex-officio members—the attorney-general, the solicitor-general and the president of the Incorporated Law Society, and ten members appointed by the three Inns of Court, the Incorporated Law Society and the council itself on the nomination of the general council of the bar. The practitioner and the student now get for a subscription of four guineas a year the reports in all the superior courts and the House of Lords, and the judicial committee of the privy council issued in monthly parts a king's printer's copy of the statutes, and weekly notes, containing short notes of current decisions and announcements of all new rules made under the Judicature Acts and other acts of parliament, and other legal information. In addition the subscriber receives the chronological index of the statistics published from time to time by the Stationery Office, and last, but not least, the Digests of decided cases published by the council from time to time. In 1862 a Digest was published containing the cases and statutes for twenty-five years, from 1837 to 1860, and this was supplemented by one for the succeeding ten years, from 1861 to 1870. The digesting is now carried on continuously by means of
of "Current Indexes," which are published monthly and continually, and consolidated into a digest at stated intervals (say) of five years. The Indian appeals series, which is not reached by the general practitioner, is supplied separately at one guinea a year.

In the 16th and 17th centuries the corporate life of the Inns of Court in London became less and less active. The general decay of the organization of crafts and guilds showed itself among lawyers as among other craftsmen.

Successful barristers, sharing in the general prosperity of the country, became less and less able and willing to devote their time to the welfare of their profession as a whole. The Inns of Chancery, though some of their buildings still remain, picturesque survivals in their "suburbs"—ceased to be used as places for the education of students. The benches of the Inns of Court, until the revival towards the middle of the 19th century, had wholly ceased to concern themselves with the systematic teaching of law. The modern system of legal education may be said to date from the establishment, in 1826, of the council of legal education, a body of twenty judges and barristers appointed by the four Inns of Court to control the legal education of students preparing to be called to the bar. The most important feature is the examination which a student must pass before he can be called. The examination (which by degrees has been made "stiffer") serves the double purpose of fixing the compulsory standard which all must reach, and of guiding the reading of students who may desire, sooner or later, to carry their studies beyond this standard. The subjects in which the examination is divided into Roman law; Common law and law and legal history; Evidence, Procedure and Criminal law; Real and Personal Property; Equity; and Common law. The council of legal education also appoints a body of readers and assistant readers, practising barristers, who deliver lectures and hold classes.

Meanwhile the custom remains by which a student reads for a year or more as a pupil in the chambers of some practising barrister. In the 18th century it became usual for students to read with a solicitor or attorney, and after a short time the modern practice grew up of reading in the chambers of a conveyancer, equity draftsman or special pleader, or, in more recent times, in the chambers of a junior barrister. Before the modern examination system, a student required to have a certificate from the barrister in whose chambers he had been a pupil before he could be "called," but the only relic of the old system now is the necessity of attending dinners, six (three for university men) in each of the four terms for three years, at one of the Inns of Court.

The education of solicitors suffered from the absence of any professional organization until the Incorporated Law Society was established in 1825 and the following years. So far as any professional education is provided for solicitors or required from them, this is due to the efforts of the Law Society. As early as 1729 it was required by statute that any person applying for admission as attorney or solicitor should submit to examination by one of the judges, who was to test his fitness and capacity in consideration of a fee of one shilling. At the same time a regular preliminary service under articles was required, that is to say, under a contract by which the clerk was bound to serve for five years. The examination soon became, perhaps always was, an empty form. The Law Society, however, soon showed zeal for the education of future solicitors. In 1813 lectures were instituted. In 1836 the first regular examinations were established, and in 1860 the present system of examinations—preliminary, intermediate and final—came into effect. Of these only the last two are devoted to law, and both are of a strictly professional character. The final examination is a fairly severe test of practical acquaintance with all branches of modern English law. The Law Society makes some provision for the teaching of students, but this teaching is designed solely to assist in preparation for the examination.

At the universities of Oxford and Cambridge there has, since 1830, been an attempt to promote the study of law. The curriculum of legal subjects in which lectures are given and examinations held is calculated to give a student a sound fundamental knowledge of general principles, as well as an elementary acquaintance with the titles of modern English law. Jurisprudence, Roman law, Constitutional law and Municipal law are taught, as well as the law of Real and Personal Property, the Law of Contract and Tort, Criminal law, Procedure and Evidence. But the law trips and the law schools suffer from remoteness from the law courts, and from the exclusively academic character of the teaching. Law is also taught, though not on a very large scale, at Manchester and at Liverpool. London University has encouraged the study of law by its examinations for law certificates by which a substitute for a high standard of knowledge is required; and at University College, London, and King's College, London, teaching is given in law and jurisprudence.

ENGLISH LITERATURE. The following discussion of the evolution of English literature, i.e. of the contribution to literature made in the course of ages by the writers of England, is planned so as to give a comprehensive view of the details as to particular authors and their work, and special consideration of the greater writers, being given in the separate articles devoted to them. It is divided into the following sections: (1) Earliest times to Chaucer; (2) Chaucer to the end of the middle ages; (3) Elizabethan times; (4) the Restoration period; (5) the Eighteenth century; (6) the Nineteenth century. The object of these sections is to form connecting links among the successive literary ages, leaving the separate articles on individual great writers to deal with their special interest; attention being paid in the main to the gradually developing characteristics of the product, quod literaturae productum, which is perhaps impossible, and separate articles are devoted to American literature (q.v.), and to the vernacular literatures of Scotland (see SCOTTISH LITERATURE), Ireland (see CELTIC LITERATURE), and Wales (see WALES LITERATURE) and Canada (see CANADA LITERATURE). Reference may also be made to such general articles on particular forms as NOVEL; ROMANCE; VERSE, &c.

I. EARLIEST TIMES TO CHAUCER

English literature, in the etymological sense of the word, had, so far as we know, no existence until Christian times. There is no evidence either that the heathen English had adopted the Roman alphabet, or that they had learned to employ their native monumental script (the runes) on materials suitable for the writing of continuous compositions of considerable length.

It is, however, certain that in the pre-literary period at least one species of poetic art had attained a high degree of development, and that an extensive body of poetry was handed down—no, indeed, with absolute fixity of form or substance—from generation to generation. This unwritten poetry was the work of minstrels who found their audiences in the halls of kings and nobles. Its themes were the exploits of heroes belonging to the royal houses of Germanic Europe, with which its listeners claimed kinship. Its metre was the alliterative long line, the iazy rhythm of which shows that it remained uninflected, but to be recited—probably with some kind of instrumental accompaniment. Of its beauty and power we may judge from the best passages in Beowulf (q.v.), for there can be little
doubt that this poem gained nothing and lost much in the process of literary redaction.

The conversion of the people to Christianity necessarily involved the decline of the minstrelsy that celebrated the glories of heathen times. Yet the descendants of Woden, even when they were devout Christians, would not easily lose all interest in the achievements of their kindred of former days. Chaucer’s knowledge of "the song of Wode" is one proof among others that even so late as the 14th century the deeds of Germanic heroes had not ceased to be recited in minstrel verse. The paucity of the extant remains of Old English heroic poetry is no argument to the contrary. The wonder is that any of it has survived at all. We may well believe that the professional reciter would, as a rule, be jealous of any attempt to commit to writing the poems which he had received by tradition or had himself composed. The clergy, to whom we owe the writing and the preservation of the Old English MSS, would only in rare instances be keenly interested in secular poetry. We possess, in fact, portions of four narrative poems, treating of heroic legend—Beowulf, Widsith, Finnesburh and Waldere. The second of these has no poetical merit, but great archaeological interest. It is an enumeration of the famous kings known to German tradition, put into the mouth of a minstrel (named Widsith, "far-travelled"), who claims to have been at many of their courts and to have been rewarded by them for his song. The list includes historical personages such as Vortigern and Hengist, and has been gradually and doubtfully added and changed during many centuries apart, but (with the usual chronological vagueness of tradition) are treated as contemporaries. The extant fragment of Finnesburh (50 lines) is a brilliant battle piece, belonging to a story of which another part is introduced episodically in Beowulf. Waldere, of which we have two fragments (together 68 lines) is concerned with Frankish and Bur- gundian traditions based on events of the 5th century; the hero is the "Waltharius" of Ekkehart’s famous Latin epic. The English poem may possibly be as old as the genuine example of minstrel poetry, but the portions that have survived are hardly inferior to the best passages of Beowulf.

It may reasonably be assumed that the same minstrels who entertained the English kings and nobles with the recital of ancient heroic traditions would also celebrate in verse the martial deeds of their own patrons and their immediate ancestors. Probably there may have existed an abundance of poetry commemorative of events in the conquest of Britain, and the struggle with the Danes. Two examples only have survived, both belonging to the 10th century: The Battle of Brunanburh, which has been greatly over-praised by critics who were unaware that its striking phrases and compounds are mere traditional echoes; and the Battle of Maldon, the work of a truly great poet, of which unhappily only a fragment has been preserved.

One of the marvels of history is the rapidity and thoroughness with which Christian civilization was adopted by the English. Augustine landed in 597; forty years later was born an Englishman, Aldhelm, who in the judgment of his contemporaries throughout the Christian world was the most accomplished scholar and the finest Latin writer of his time. In the next generation England produced in Bede (Beda) a man who in solidity and variety of knowledge, and in literary power, had for centuries no rival in Europe. Aldhelm and Bede are known to us only from their Latin writings, though the former is recorded to have written vernacular poetry of great merit. The extant Old English literature is almost entirely Christian, for the poems that belong to an earlier period have been expurgated and interpolated in a Christian sense. From the writings that have survived, it would seem as if men strove to forget that England had ever been heathen. The four deities whose names are attached to the days of the week are hardly mentioned at all. The names Thunor and Tiw are sometimes used to translate the Latins historical personages such as Runicmar (Woden) and Aegir (god) in the genealogies of the kings, and his name occurs once in a magical poem, but that is all. Bede, as a historian, is obliged to tell the story of the conversion; but the only native divinities he mentions are the goddesses Hrēth and Eostre, and all we learn about them is that they gave their names to Hrēthmēnōth (March) and Easter. That superstitious practices of heathen origin long survived among the people is shown by the acts of church councils and by a few poems of a magical nature that have been preserved; but, so far as can be discovered, the definite worship of the ancient gods quickly died out. English heathenism perished without leaving a record.

The Old English religious poetry was written, probably without exception, in the cloister, and by men who were familiar with the Bible and with Latin devotional literature. Setting aside the wonderful Dream of the Rood, it gives little evidence of high poetic genius, though much of it is marked by a degree of culture and refinement that we should hardly have expected. Its material and thought are mainly derived from Latin sources; its expression is imitated from the native heroic poetry. Considering that a great deal of Latin verse was written by Englishmen in the 7th and succeeding centuries, and that in one or two poems the line is actually composed of an English and a Latin hemistic rhyming together, it seems strange that the Latin influence on Old English versification should have been so small. The alliterative long line is throughout the only metre employed, and although the laws of alliteration and rhythm were less rigorously obeyed in the later than in the earlier poetry, there is no trace of approximation to the structure of Latin verse. It is true that, owing to imitation of the Latin hymns of the church, some of the lines become gradually and incidentally more literary and formalistic than an ornament of Old English verse; but it remained an ornament only, and never became an essential feature. The only poem in which rhyme is employed throughout is one in which sense is so completely sacrificed to sound that a translation would hardly be possible. It was not only in metrical respects that the Old English religious poetry remained faithful to its native models. The imagery and the diction are mainly those of the old heroic poetry, and in some of the poems Christ and the saints are more the object of veneration, under the aspect of Germanic warriors. Nearly all the religious poetry that has any considerable religious value seems to have been written in Northumbria during the 8th century. The remarkably vigorous poem of Judith, however, is certainly much later; and the Exodus, though early, seems to be of southern origin. For a detailed account of the Old English sacred poetry, the reader is referred to the articles on Cædmon and Cynewulf, to one or other of whom nearly every one of the poems, except those of obviously late date, has at some time been attributed.

The Riddles (q.v.) of the Exeter Book resemble the religious poetry in being the work of scholars, but they bear much more decidedly the impress of the native English character. Some of them rank among the most artistic and pleasing productions of Old English poetry. The Exeter Book contains also several pieces of a gnomic character, conveying proverbial instruction in morality and worldly wisdom. Their morality is Christian, but it is not unlikely that some of the wise sayings they contain may have come down by tradition from heathen times. The very curious Dialogue of Solomon and Saturn may be regarded as belonging to the same class.

The most original and interesting portion of the Old English literary poetry is the group of dramatic monologues—The Bonished Wife’s Complaint, The Husband’s Message, The Wanderer, The Seafarer, Deer and Wulf and Eadwacer. The date of these compositions is uncertain, though their occurrence in the Exeter Book shows that they cannot be later than the 10th century. That they are all of one period is at least unlikely, but they are all marked by the same peculiar tone of pathos. The monodramatic form renders it difficult to obtain a clear idea of the situation of the supposed speakers. It is not improbable that most of these poems may relate to incidents of heroic legend, with which the original readers were presumed to be familiar. This, however, can be definitely affirmed only in the case of the two short pieces—Deer and Wulf and Eadwacer—which have something of a lyric character, being the only examples in Old English of strophic structure and the use of the refrain. Wulf and Eadwacer, indeed, exhibits a still further
development in the same direction, the monotony of the long line metre being varied by the admission of short lines formed by the suppression of the second hemistich. The highly developed art displayed in this remarkable poem gives reason for believing that the existing remains of Old English poetry very inadequately represent its extent and variety.

While the origins of English poetry go back to heathen times, English prose may be said to have had its effective beginning in the reign of Alfred. It is of course true that vernacular prose of some kind was written much earlier. The English laws of Ælfric of Kent, though it is perhaps unlikely that they were written down, as is commonly supposed, in the lifetime of Augustine (died A.D. 604), or even in that of the king (d. 616), were well known to Bede; and even in the 12th century, the transcript that has come down to us, their crude and elliptical style gives evidence of their high antiquity. Later kings of Kent and of Wessex followed the example of publishing their laws in the native tongue. Bede is known to have translated the beginning of the gospel of John (down to vi. q). The early part of the Anglo-Saxon Chronicle (q.v.) is probably founded partly on prose annals of pre-Alfredan date. But although the amount of English prose written between the beginning of the 7th and the middle of the 7th century may have been considerable, Latin continued to be regarded as the appropriate vehicle for works of any literary pretension. If the English clergy had retained such a relationship with the days of Aldhelm and Bede, the creation of a vernacular prose literature would probably have been longer delayed; for while Alfred certainly was not indifferent to the need of the laity for instruction, the evil that he was chiefly concerned to combat was the ignorance of their spiritual guides.

Of the works translated by him and the scholars whom he employed, St. Gregory's Pastoral Care and his Dialogues (the latter written by Bishop Werfthor) are expressly addressed to the priesthood; if the other translations were intended for a wider circle of readers, they are all (not excepting the secular History of Orison) essentially religious in purpose and spirit. In the interesting preface to the Pastoral Care, in the important accounts of Northern lands and peoples inserted in the Orison, and in the free rendering and amplification of the Consolation of Boethius and the Soliloquies of Augustine, Alfred appears as an original writer. Other fruits of his activity are his Laws (preserved by a collection of those of the 7th-century predecessor, Ein of Wessex), and the beginnings of the Anglo-Saxon Chronicle. The Old English prose after Alfred is entirely of clerical authorship; even the Laws, so far as their literary form is concerned, are hardly to be regarded as an exception. Apart from the Chronicle (see Anglo-Saxon Chronicles), the bulk of this literature consists of translations from Latin and of homilies and saints' lives, the substance of which is derived from sources mostly accessible to us in their original form; it has therefore for us little importance except from the philological point of view. This remark may be applied, in the main, even to the writings of Ælfric, notwithstanding the great interest which attaches to his brilliant achievement in the development of the capacities of the native language for literary expression. The translation of the gospels, though executed in Ælfric's time (about 1000), is by other hands. The sermons of his younger contemporary, Archbishop Wulfstan, are marked by earnestness and eloquence, and contain some passages of historical value.

From the early years of the 11th century we possess an encyclopaedic manual of the science of the time—chronology, astronomy, arithmetic, metre, rhetoric and ethics—by the monk Byrhtferth, a pupil of Abbo of Fleury. It is a compilation, but executed with intelligence. The numerous works on medicine, the properties of herbs, and the like, are in the main composed of selections from Latin treatises; so far as they are original, they_little evidence of superstition which is far more than the mere expression of popular taste. It is interesting to observe that they contain one or two formulas of incantations in Irish.

Two famous works of fiction, the romance of Apollonius of Tyre and the Letter of Alexander, which in their Latin form had much influence on the later literature of Europe, were Englished in the 12th century with considerable skill. To the same period belongs the curious tract on The Wonders of the East. In these works, and some minor productions of the time, we see that the minds of Englishmen were beginning to find interest in other than religious subjects.

The crowding of the English monasteries by foreigners, which was one of the results of the Norman Conquest, brought about a rapid arrest of the development of the vernacular literature. It was not long before the boys trained in the monastic schools ceased to learn to read and write their native tongue, and learned instead to read and write French. The effects of this change are visible in the rapid alteration of the literary language. The artificial tradition of grammatical correctness lost its hold; the archaic literary vocabulary fell into disuse; and those who wrote English at all wrote as they spoke, using more and more an extemporized phonetic spelling based largely on French analogies.

The 12th century is a brilliant period in the history of Anglo-Latin literature, and many works of merit were written in French (see Anglo-Norman). But vernacular literature is scanty and of little originality. The Peterborough Chronicle, it is true, was continued till 1134, and its later portions, while markedly exemplifying the changes in the language, contain some really admirable writing. But it is substantially correct to say that from this point until the age of Chaucer vernacular literature was less than that of our early religious literature. For light on the intellectual life of the nation during this period we must look mainly to the works written in Latin. The homilies of the 11th century are partly modernized transcripts from Ælfric and other older writers, partly translations from French and Latin; the remainder is mostly commonplace in substance and clumsy in expression. At the beginning of the 13th century the Ancren Riwel (q.v.), a book of counsel for nuns, shows true literary genius, and is singularly interesting in its substance and spirit; but notwithstanding the author's remarkable mastery of English expression, his culture was evidently French rather than English. Some minor religious prose works of the same period are not without merit. But these examples had no literary following. In the early 14th century the writings of Richard Rolle and his school attained great popularity. The profound influence which they exercised on later religious thought, and on the development of prose style, has seldom been adequately recognized. The Avesberg (q.v. see Anglican), a wretchedly unintelligible translation (finished in 1349) from Frère Lorens's Somme de vices et des vertus, is valuable to the student of language, but otherwise worthless.

The break in the continuity of literary tradition, induced by the Conquest, was no less complete with regard to poetry than with regard to prose. The poetry of the 13th and the latter part of the 12th century was uninfluenced by the written works of Old English poets, whose archaic diction had to a great extent become unintelligible. But there is no ground to suppose that the succession of popular singers and reciters was ever interrupted. In the north-west, indeed, the old recitative metre seems to have survived in oral tradition, with little more alteration than was rendered necessary by the changes in the language, until the middle of the 14th century, when it was again adopted by literary versifiers. In the south this metre had greatly degenerated in strictness before the Conquest, but, with gradually increasing laxity in the laws of alliteration and rhythm, it continued long in use. It is commonly believed, with great intrinsic probability but with scanty actual evidence, that in the Old English period there existed, beside the alliterative line, other forms of verse adapted not for recitation but for singing, used in popular lyrics and ballads that were deemed too trivial for written record. The influence of native popular poetic tradition, whether in the form of recited or of sung verse, is nowhere discernible in the work of the 13th and early part of the 14th century, and the romances and romances of the 12th century, far more than the taste of popular song, have been preserved. But the authors of these poems were familiar with Latin, and probably spoke French as easily as their mother tongue; and there was no longer any literary convention to restrain them from adopting foreign metrical forms. The
an extensive series of Lives of Saints, metrically and linguistically closely resembling Robert of Gloucester’s Chronicle, and perhaps wholly or in part of the same authorship. A similar collection was written in the north of England, as well as a large body of homilies showing considerable poetic skill, and abound in examples or illustrative stories. Of examples several prose collections had already been made in Anglo-French, and William of Waddington’s poem Manuel des pêcheurs, which contains a great number of them, was translated in 1303 by Robert Mannyng already mentioned, with some enlargement of the anecdotic element, and frequent omissions of didactic passages. The great rhyming chronicle of Scripture history entitled Cursor Mundi (q.v.) was written in the north about this time. It was extensively read and transcribed, and exercised a powerful influence on later writers down to the end of the 14th century. The remaining homiletic verse of this period is too abundant to be referred to in detail; it will be enough to mention the sermons of William of Shoreham, written in strophic form, but showing little either of metrical skill or poetic feeling. To the next generation belongs the Friar’s Prologue of Chaucer Rolle, the influence of which was not less powerful than that of the author’s own writings.

Romantic poetry, which in French had been extensively cultivated, both on the continent and in England from the early 13th century, reached a high degree of perfection about 1250. In the next hundred years its development was marvellously rapid. Of the vast mass of metrical romances produced during this period no detailed account need here be attempted (see ROMANCE, and articles, &c. referred to: ARTHURIAN ROMANCE). Native English traditions form the basis of King Horn, Guy of Warwick, Bevis of Hamton and Havelok, though the stories were first put into literary form by Anglo-Norman poets. The popularity of these home-grown tales (with which may be classed the wildly fictitious Coed de Lien) was soon rivalled by that of imports from France. The English rendering of Floris and Blancheflor (a love-romance of Greek origin) is found in the same MS. that contains the earliest copy of King Horn. Before the end of the century, the French “matter of Britain” was represented in English by the Southern Arthur and Merlin and the Northern Tristan and Yseult and Gawain, the “matter of France” by Roland and Vernagu and Otude; the Alexander was also translated, but in this instance the immediate original was an Anglo-French and not a continental poem. The tale of Troy did not come into English till long afterwards. The Auchenleck MS., written about 1330, contains no fewer than 14 poetical romances; there were many others in circulation, and the number continued to grow. About the middle of the 14th century, the Old English alliterative long line, the most original of all our early poetics, a high form of alliterative poetry, emerges again in literature. One of the earliest poems in this revived measure, Wynnes and Wastoure, written in 1352, is by a professional reciter-poet, who complains bitterly that original minstrel poetry no longer finds a welcome in the halls of great nobles, who prefer to listen to those who recite verses not of their own making. About the same date the metre began to be employed by men of letters for the translation of romance—William of Palerne and Joseph of Arimathie from the French, Alexander from Latin prose. The later development of alliterative poetry begins mainly to the age of Chaucer.

The extent and character of the literature produced during the first half of the 14th century indicate that the literary use of the native tongue was no longer, as in the preceding age, a mere condescension to the needs of the common people. The rapid disuse of French as the ordinary medium of intercourse among the middle and higher ranks of society, the consequent substitution of English for French as the vehicle of school instruction, created a widespread demand for vernacular reading. The literature which arose in answer to this demand, though it consisted mainly of translations or adaptations of foreign works, yet served to develop the appreciation of poetic beauty, and to prepare an audience in the near future for a poetry in which the genuine thought and feeling of the nation were to find expression.

II. CHAUCER TO THE RENAISSANCE

The age of Chaucer is of peculiar interest to the student of literature, not only because of its brilliancy and productiveness but also because of its apparent promise for the future. In this, as in other aspects, Chaucer (c. 1340–1400) is its most notable literary figure. Beginning as a student and imitator of the best French poetry of his day, he was for a time, like most of his French contemporaries, like a little poverty-stricken poet of elegant verses, dealing with conventional material in a conventional way, arranging in new figures the same flowers and bowers, sunsets and song-birds, and companies of fair women and their lovers, that had been arranged and rearranged by every poet of the court circle for a hundred years, and celebrated in sweet phrases of almost unmoving sameness. Even at this time, to be sure, he was not without close and loving observation of the living creatures of the real world, and his verses often bring us flowers dewy and fragrant and fresh of colour as they grew in the fields and gardens about London, and birds that had learned their music in the woods; but his poetry was still not easily distinguishable from that of Machaut, Froissart, Deschamps, Trasoun and the other "courty makers" of France. But while he was still striving to master perfectly the technique of this pretty art of trifling, he became acquainted with the new literature of Italy, both poetry and prose. Much of the new poetry moved, like that of France, among the conventionalities and artificialities of an unreal world of romance, but it was of wider range, of fuller tone, of far greater emotional intensity, and, at its best, was the fabric, not of elegant ingenuity, but of creative human passion,—in Dante, indeed, a wonderful visionary structure in which love and hate, pity and terror, and the forms and countenances of men were more vivid and real than in the world of real men and real passions. The new prose moved with Chaucer all through several of the great Italian writers—was vastly different from any that he had ever read in a modern tongue. Here were no mere brief anecdotes like those exemplos which in the middle ages illustrated vernacular as well as Latin sermons, no cumbrous, slow-moving treatises on the Seven Deadly Sins, no half-articulate, pious meditations, but rapid, vivid, well-constructed narratives ranging from the sentimental beauty of stories like Giselda and the Franklin's Tale to coarse mirth and malicious vulgarity equal to those of the tales told later by Chaucer's Miller and Reeve and Summoner. All these things he studied and some he imitated. There is scarcely a feature of the verse that has not left some trace in his own; the prose he did not imitate as prose, but there can be little doubt that the subject matter of Boccaccio's tales and novels, as well as his poems, affected the direction of Chaucer's literary development, and quickened his habit of observing and utilizing human life, and that the narrative art of the prose was influential in the transformation of his methods of narration.

This transformation was effected not so much through the mere superiority of the Italian models to the French as through the stimulus which the differences between the two gave to his reflections upon the processes and technique of composition, for Chaucer was not a careless, happy-go-lucky poet of divine endowment, but a conscious, reflective artist, seeking not merely for fine words and fine sentiments, but for the proper arrangement of events, the significant exponent of character, the right tone, and even the appropriate background and atmosphere,—as may be seen, for example, in the transformations he wrought in the "Pardoner's Tale." It is therefore in the latest and most original of the Canterbury Tales that his art is most admirable, most distinguished by technical excellences. In these we find so rare a admirable quality that we almost forget that he had any defects. His diction is a model of picturesque, of simplicity, of dignity, and of perfect adaptation to his theme: his versification is not only correct but musical and varied, and shows a progressive tendency towards freer and more complex melodies; his best tales are not mere repetitions of the ancient stories they retell, but new creations, transformed by his own imaginative realization of them, full of figures having the dimensions and the vivacity of real life, acting on adequate motives, and moving in an atmosphere and against a background appropriate to their characters and their actions. In the tales of the Pardoner, the Franklin, the Summoner, the Squire, he is no less notable as a consummate artist than as a poet.

Chaucer, however, was not the only writer of his day remarkable for mastery of technique. Gower, indeed, though a man of much learning and intelligence, was neither a poet of the first rank nor an artist. Despite the admirable qualities of clearness, order and occasional picturesque which distinguish his work, he lacked the ability which great poets have of making their words mean more than they say, and of stirring the emotions even beyond the bounds of this enhanced meaning; and there is not, perhaps, in all his voluminous work in English, French and Latin, any indication that he regarded composition as an art requiring consideration or any care beyond that of conforming to the chosen rhythm and finding suitable rhymes.

There were others more richly endowed as poets and more finely developed as artists. There was the beginner of the Piers Plowman cycle,1 the author of the Prologue and first eight passus of the A-text, a man of clear and profound observation, a poet whose imagination brought before him with distinctness and reality visual images of the motley individuals and masses of men of whom he wrote, an artist who knew how to organize and direct the figures of his dream-world, the movement of his ever-unfolding vision. There was the remarkable successor of this man, the author of the B-text, an almost prophetic figure, a great poetic idealist, and, helpless though he often was in the direction of his thought, an absolute master of images and words that seize upon the heart and haunt the memory. Besides these, an unknown writer far in the north-west had, in Gawain and the Grene Knight, transformed the medieval romance into a thing of speed and colour, of vitality and mystery, no less remarkable for its fluent definiteness of form than for the delights of gaiety and the sad, graceless comedy of temptation. And there also, by some strange chance, blossomed, with perhaps only a local and temporary fragrance until its rediscovery in the 19th century, that delicate flower of loneliness and aspiration, Pearl, a wonder of elaborate art as well as of touching sentiment.

All these writings are great, not only relatively, but absolutely. There is not one of them which would not, if written in our own time, immediately mark its author as a man of very unusual gifts. But the point of special concern to us at the present moment is not so much that they show remarkable poetic power, as that they possess technical merits of a very high order. And we are accustomed to believe that, although genius is a purely

---

1 Piers Plowman has been so long attributed as a whole to Langland (g.v.), that in spite of modern analytical criticism it is most conveniently discussed under that name.
personal and incommunicable element, technical gains are a common possession; that after Marlowe had developed the technique of blank verse, this technique was available for all; that after Pope had mastered the heroic couplet and Gray the ode, and Poe the short story, all men could write couplets and odes and short stories of technical correctness; that, as Tennyson puts it, "All can grow the flower now. For all have got the seed."

But this was singularly untrue of the technical gains made by Chaucer and his great contemporaries. *Pearl and Patience* were apparently unknown to the 15th century, but *Gawain* and *Piers Plowman* and Chaucer's works were known and were influential in one way or another throughout the century. *Gawain* called into existence a large number of romances dealing with the same hero or with somewhat similar situations, some of them written in verse suggested by the remarkable verse of their model, but the resemblance, even in versification, is only superficial. *Piers Plowman* gave rise to satirical allegories written in the alliterative long line and furnished the figures and the machinery for many satires in other metres, but the technical excellence of the first *Piers Plowman* poem was soon buried for centuries under the tremendous social significance of its successors. And in the work, in spite of the fact that he was praised and imitated by many writers and definitely claimed as master by more than one, not only transmitted to them scarcely any of the technical conquests he had made, but seems also to have been almost without success in creating any change in the taste of the public that read his poems so eagerly, any demand for better literature than had been written by his predecessors.

Wide and lasting Chaucer's influence undoubtedly was. Not only was all the court-poetry, all the poetry of writers who pretended to cultivation and refinement, throughout the century, in England and Scotland, either directly or indirectly imitative of his work, but even the humbler productions of unpretentious writers show at times traces of his influence. Scotland was fortunate in having writers of greater ability than England had (see SCOTLAND: Literature). In England the three chief followers of Chaucer known to us by name are Lydgate, Hoccleve (see OCCELE) and Hawes. Because of their praise of Chaucer and their supposed personal relations to him, Lydgate and Hoccleve are almost inseparable in modern discussions, but 15th century readers and writers appear not to have associated them very closely. Indeed, Hoccleve is rarely mentioned, while Lydgate is not only mentioned continually, but continually praised as Chaucer's equal or even superior. Hoccleve was not, to be sure, as prolific as Lydgate, but it is difficult to understand why his work, which compares favourably in quality with Lydgate's, attracted so much less attention. The title of his greatest poem, *De regimine principum*, may have repelled readers who were not princely born, though they would have found the work full of the moral and prudential maxims and illustrative anecdotes so dear to them; but his attack upon Sir John Oldcastle as a heretic ought to have been decidedly to the taste of the orthodox upper classes, while his lamentations over his misspent youth, his tales and some of his minor poems might have interested and delighted the less rigorous spirits. Lydgate, however, in the mild way, more humorous and more original. Also despite his sense of personal loss in Chaucer's death and his care to transmit to posterity the likeness of his beloved master, he seems to have been less slavish than Lydgate in imitating him. His memory is full of Chaucer's phrases, he writes in verse-forms hallowed by the master's use, and he tries to give to his lines the movement of Chaucer's decasyllables, but he is comparatively free from the influence and its successor. And the imitative side of the work produced in the 15th century so dreary a flock of imitations.

Lydgate's productivity was enormous,—how great no man can say, for, as was the case with Chaucer also, his fame caused many masterless poems to be ascribed to him, but, after making all necessary deductions, the amount of verse that has come down to us from him is astonishing. Here it may suffice to say that his translations are predominantly epic (140,000 lines), and his original compositions predominantly allegorical love poems or didactic poems. If there is anything duller than a dull epic it is a dull allegory, and Lydgate has achieved both. This is not to deny the existence of good passages in his epics and ingenuity in his allegories, but there is no pervading, persistent life in either. His epics, like almost all the narrative verse of the time, whether epic, meditative, or Pastoral, Whim, or satirical romance, seem designed merely to satisfy the desire of 15th century readers for information, the craving for facts—true or fictitious—the same craving that made possible the poems on alchemy, on hunting, on manners and morals, on the duties of parish priests, on the seven liberal arts. His allegories, like most allegories of the age, are ingenious rearrangements of old figures and old machinery, they are full of what had once been imagination but had become merely memory assisted by cleverness. The great fault of all his work, as of nearly all the literature of the age, is that it is merely a more or less skilful manipulation of what the author had somewhere read or heard, and not a faithful transcription of the author's own peculiar sense or conception of what he had seen or heard or read. The fault is not that the old is repeated, that a twice-told tale is retold, but that it is retold without being re-imagined by the teller of the tale, without taking it from his personality anything that was not in it in the first place. To be sure, was a thing that Lydgate and his fellows tried to supply, and some of them supplied it abundantly according to their lights. But style meant to them external decoration, classical allusions, personifications, an inverted or even dislocated order of words, and that famous "ornate diction," those "aurate terms," with which they strove to surpass the melody, picturesqueness and dignity which, for all its simplicity, they somehow dimly discerned in the diction of Chaucer.

Stephen Hawes, with his allegorical treatise on the seven liberal sciences, came later than these men, only to write worse. He was a disciple of Lydgate rather than of Chaucer, and is not only lacking in the vigour and sensitiveness which Lydgate sometimes displays, but exaggerates the defects of his master. If it be a merit to have conceived the pursuit of knowledge under the form of the efforts of a knight to win the hand of his lady, it is almost the sole merit to which Hawes can lay claim. Two or three good situations, an episode of low comedy, and the epitaph of the Knight with its famous final couplet, exhaust the list of his credits. The efforts that have been made to trace through Hawes the line of Spenser's spiritual ancestry seem not well advised. The resemblances that have been pointed out are such as arise inevitably from the allegories and from the traditional material with which both worked. There is no reason to believe that Spenser owed his general conception to Hawes, or that the *Pastime of Pleasure* would have been different in any essential respect from its present form if the *Pastime of Pleasure* had never been written. The machinery of chivalric romance had already been applied to spiritual and moral themes in Spain without the aid of Hawes. It is obvious that the fundamental lack of all these men was imaginative power, poetic ability. This is a sufficient reason for failure to write good poetry. But why did not men of better quality remain in literature? It is because of the perturbed conditions arising from the prevalence of foreign and civil wars? Perhaps not, though it is clear that if Sir Thomas Malory had perished in one of the many fights through which he lived, the chivalric and literary impulses which he perhaps received from the "Padre de Curteisy," Richard Beauchamp, earl of Warwick, would have gone for nothing and we should not lack the *Morte Darthur*. But it may very well be that the wars and the tremendous industrial growth of England fixed the attention of the strongest and most original spirits among the younger men and so withdrew them from the possible attractions of literature. But, after all, whatever general truth may lie in such speculations, the way of a young man with his own life is as incalculable as any of the four things which Agur son of Jakeb declared to be past finding out; local
and special accidents rather than general communal influences are apt to shape the choice of boys of exceptional character, and we have many instances of great talents turning to literature or trade. Commerce or science was the dominant attraction of social life.

But even recognizing that the followers of Chaucer were not men of genius, it seems strange that their imitation of Chaucer was what it was. They not only entirely failed to see what his merits as an artist were and how greatly superior his mature work is to his earlier in point of technique; they even preferred the earlier and imitated it almost exclusively. Furthermore, his mastery of verse seemed to them to consist solely in writing verses of approximately four or five stresses and arranging them in couplets or in stanzas of seven or eight lines. Their preference for the early allegorical work can be explained by their lack of taste and critical discrimination and by the great vogue of allegorical writing in England and France. Men who are just beginning to think about the distinction between literature and ordinary writing usually feel that it consists in making literary expression differ as widely as possible from simple direct speech. For this reason some sort of artificial diction is developed and some artificial word order devised. Allegory is used as an elegant method of avoiding unpoetical plainness, and is an easy means of substituting logic for imagination. The failure to reproduce in some degree at least the melody and smoothness of Chaucer's decasyllabic verse, and the particular form which that failure took in Lydgate, are to be explained by the fact that Lydgate and his fellows never knew how Chaucer's verse sounded when properly read. It is a mistake to suppose that the disappearance of final unaccented e from many words or its instability in many others made it difficult for Lydgate and his fellows to write melodious verse. Melodious verse has been written since the disappearance of all these sounds, and the possibility of a choice between a form with final e and one without it is not a hindrance but an advantage to a poet, as Goethe, Schiller, Heine and innumerable German poets have shown by their practice. The real difficulty with these men was that they pronounced Chaucer’s verse as if it were written in the English of their own day. As a matter of fact all the types of verse discovered by scholars in Lydgate's poems can be discovered in Chaucer's also if they be read with Lydgate's pronunciation. Chaucer did not write archaic English, as some have supposed,—that is, English of an earlier age than his own,—it would have been impossible for him to do so with the unifailing accuracy he shows; he did, however, write a conservative, albeit an old-fashioned, English, such as was spoken by the conservative members of the class of society to which he was attached and for which he wrote. An English with fewer final e’s was already in existence among the less conservative classes, and this rapidly became standard English in consequence of the social changes which occurred during his own life. We know that a misunderstanding of Chaucer’s verse existed from the 16th century to the time of Thomas Tyrwhitt; it seems clear that it began even earlier, in Chaucer’s own lifetime.

There are several poems of the 15th century which were long ascribed to Chaucer. Among them are:—the Complaint of the Black Knight, or Complaint of a Lover's Life, now known to be Lydgate’s; the Mother of God, now ascribed to Hoccleve; the Cuckoo and the Nightingale, by Clanvowe; La Belle Dame sans merci, a translation from the French of Alain Chartier by Richard Russe; Chaucer's Dreams, or The Isle of Ladies; the Assembly of Ladies; the Flower and the Leaf; and the Court of Love. The two poems of Lydgate and Hoccleve are as good as Chaucer's poorest work. The Assembly of Ladies and the Flower and the Leaf are perhaps better than the Book of the Duchess, but not so good as the Parliament of Fowls. The Flower and the Leaf, it will be remembered, was very dear to John Keats, who, like all his contemporaries, regarded it as Chaucer’s. An additional interest attaches to both it and the Assembly of Ladies, from the fact that the author may have been a woman; Professor Skeat is, indeed, confident that he knows who the woman was and when she wrote. These poems, like the Court of Love, are thoroughly conventional in material, all the figures and poetical machinery may be found in dozens of other poems in England and France, as Professor Neilson has shown for the Court of Love and Marsh for the Flower and the Leaf. But the false spirit and a love of beauty in them that are not common; the conventional birds and flowers are there, but they seem, like those of Chaucer's Legend, to have some touch of life, and the conventional companies of ladies and gentlemen ride and talk and walk with natural grace and ease. The Court of Love is usually ascribed to a very late date, as late even as the middle of the 16th century. If this is correct, it is a notable instance of the persistence of a Chaucerian influence. An effort has been made, to be sure, to show that it was written by Scogan and that the writing of it constituted the offence mentioned by Chaucer in his Ennui to Scogan, but it has been clearly shown that this is impossible, both because the language is later than Scogan's time and because nothing in the poem resembles the offence clearly described by Chaucer.

Whatever may be true of the authorship of the Assembly of Ladies and the Flower and the Leaf, there were women writers in England in the middle ages. Juliana of Norwich wrote her Revelations of Divine Love before 1400. The much discussed Dame Juliana Berners, the supposed compiler of the treatise on hunting in the Book of St Albans, may be mythical, though there is no reason why a woman should not have written such a book; and a shadowy figure that disappears entirely in the sunlight is the supposed authoress of the Nut Brown Maid, for if language is capable of definite meaning, the last stanza declares unequivocally that the poem is the work of a man. But there is a poem warning young women against entering a nunnery which may be by a woman, and there is an interesting entry among the records of New Romney for 1463-1464, "Paid to Agnes Forde for the play of the Interlude of our Lord's Passion, 6s. 8d." which is apparently the earliest mention of a woman dramatist in England. Finally, Margaret, countess of Richmond, the mother of Henry VII., not only aided scholars and encouraged writers, but herself translated the (apocryphal) fourth book of St Thomas á Kempis's Imitatio Christi. Another Margaret, the duchess of Burgundy, it will be remembered, encouraged Caxton in his translation and printing. Women seem, indeed, to have been especially lovers of books and patrons of writers, and Skelton, if we may believe his Garland of Laurel, was surrounded by a bevy of ladies comparable to a modern literary club; Erasmus's Suffixelette Convent may correspond to no reality, but the Learned Lady arguing against the Nuns for the usefulness and pleasure derived from books was not an unknown type. Women were capable of many things in the middle ages. English records show them to have been physicians, churchwardens, justices of the peace and sheriffs, and, according to a satirist, they were also priestess.

The most original and powerful poetry of the 15th century was composed in popular forms for the ear of the common people and was apparently written without conscious artistic purpose. Three classes of productions deserve special attention,—songs and carols, popular ballads and certain dramatic compositions. The songs and carols belong to a species which may have existed in England before the Norman Conquest, but which certainly was greatly modified by the musical and lyric forms of France. The best of them are the direct and simple if not entirely artless expressions of personal emotion, and even when they contain, as they sometimes do, the description of a person, a situation, or an event, they deal with these things so subjectively, confine themselves so closely to the rendering of the emotional effect upon the singer, that they lose none of their directness or simplicity. Some of them deal with secular subjects, some with religious, and some are curious and delightful blendings of religious worship and aspiration with earthly tenderness for the embodiments of helpless infancy and protecting motherhood which gave Christianity so much of its power over the affections and imagination of the middle ages. Even those which begin as mere expressions of joy in the Yule-tide eating and drinking and Merriment catch at moments hints of higher
joys, of finer emotions, and lift singer and hearer above the noise
and stir of earth. Hundreds of songs written and sung in the 15th
century must have perished; many, no doubt, lived only a
single season and were never even written down; but chance
has preserved enough of them to make us wonder at the age
which could produce such masterpieces of tantalizing simplicity.

The lyrics which describe a situation form a logical, if not a
real transition to those which narrate an episode or an event.
The most famous of the latter, the Nut Brownes Mad, has often
been called a ballad, and ‘‘lyrical ballad’’ it is in the sense
established by Coleridge and Wordsworth, but its affinities are
rather with the song or carol than with the folk-ballad, and, like
Henryson’s charming Robin and Malthin, it is certainly the
work of a man of culture and of conscious artistic purpose and
methods. Unaccompanied, as it is, by any other work of the
same author, this poem, with its remarkable technical merits, is
an even more astonishing literary phenomenon than the famous
single sonnet of Blanco White. It can hardly be doubted that
the author learned his technique from the songs and carols.

The folk-ballad, like the song or carol, belongs in some form
to immemorial antiquity. It is doubtless a mistake to suppose
that any ballad has been preserved to us that is a purely com-
munal product, a confection of the common knowledge, tradi-
tions and emotions of the community wrought by subconscious
processes that were a song that finds chance but inevitable utterance
through one or more individuals as the whole commune moves
in its molecular dance. But is it equally a mistake to argue that
ballads are essentially metrical romances in a state of decay. Both
the matter and the manner of most of the best ballads forbid
such a supposition, and it can hardly be doubted that in some of
the folk-ballads of the 15th century are preserved not only
traditions of dateless antiquity, but formal elements and technical
processes that actually are derived from communal song and
dance. By the 15th century, however, communal habits and
processes of composition had ceased, and the traditional ele-
ments, formulate and technique had become merely conventional
aids and guides for the individual singer. Ancient as they were,
conventional as, in a sense, they also were, they exercised none
of the deadening, blemming influence of ordinary conventions.
They furnished, one may say, a vibrant framework of emotional
expression, each tone of which moved the hearers all the more
powerfully because it had sung to them so many old, unhappy,
far-off things, so many battles and treacheries and sudden grim
frames which the individual singer needed only to fill
out with the simplest statement of the event which had stirred
his own imagination and passions to produce, not a work of
art, but a song of universal appeal. Not a work of art, because
there are scarcely half a dozen ballads that are really works of
art, and the greatest ballads are not among these. There is
scarcely one that is free from excrescences, from dullness, from
trivialities, from which the ambition and talent of the greatest
situations and their greatest lines, were it not that we resolutely
shut our ears and our eyes, as we should, to all but their greatest
moments. But at their best moments the best ballads have an
almost incomparable power, and to a people sick, as we are,
of the ordinary, the usual, the very trivialities and impertinences
of the ballads only help to define and emphasize these best
moments. In histories of English literature the ballads have
been so commonly discussed as to be identified with the greatest
in the 18th century, that we are apt to forget that some of the
very best were demonstrably composed in the 15th and that
many others of uncertain date probably belong to the same
time.

Along with the genuine ballads dealing with a recent event or
a traditional theme there were ballads in which earlier romances
are retold in ballad style. This was doubtless inevitable in
view of the increasing epic tendency of the ballad and the interest
still felt in a real romances, but it should not mislead us into
regarding the genuine folk-ballad as an out-growth of the
metrical romance.

Besides the ordinary epic or narrative ballad, the 15th century
produced ballads in dramatic form, or, perhaps it were better
to say, dramatized some of its epic ballads. How commonly
this was done we do not know, but the scanty records of the
period indicate that it was a widespread custom, though only
three plays of this character (all concerning Robin Hood) have
come down to us. These plays had, however, no further inde-
pendent development, but merely furnished elements of incident
and atmosphere to later plays of a more highly organized type.
With these ballad plays may also be mentioned the Christmas
plays (usually of St George) and the sword-dance plays, which
also flourished in the 15th century, but survive for us only as
obscure elements in the masques and plays of Ben Jonson and in
such modern rustic performances as Thomas Hardy has so
charmingly described in The Return of the Naive.

The additions which the 15th century made to the ancient
cycles of Scripture plays, the so-called Mysteries, are another
instance of a literary effort which spent itself in vain (see
Drama). The most notable of these are, of course, the world
renowned comic scenes in the Towneley (or Wakefield) Plays, in
the pagents of Cain, of Noah and of the Shepherds. In none
of these is the 15th century writer responsible for the original
comic intention; in the pagents of Cain and of the Shepherds
fragments of the work of a 14th century writer still remain to
prove the earlier existence of the comic conception, and that it
was traditional in the Noah pageant we know from the testimony
of Chaucer’s Miller; but none the less the 15th century writer
was a comic dramatist of original power and of a skill in the
new form which was beginning to be exemplified in England.
The inability of Lydgate to develop a comic conception is strikingly displayed if one compares his
Pageant for Presentation before the King at Hersforfd with the
work of this unknown artist. But in our admiration for this
man and his famous episode of Mak and the fictitious infant,
we are apt to forget the equally fine, though very different qualities
shown in some of the later pagents of the York Plays. Such,
for example, is the final pageant, that of the Last Judgment,
drama of slow and majestic movement, to be sure, but with a
large and fine conception of the great situation, and a noble and
dignified elocution not inadequate to the theme.
The Abraham and Isaac play of the Brome MS., extant as
a separate play and perhaps so performed, which has been so
greatly admired for its cumulative pathos, also belongs
demonstrably to this century. It is not, as has been supposed,
an intermediate stage between French plays and the Chester
Abraham and Isaac, but is derived directly from the latter by
processes which comparison of the two easily reveals. Scripture
plays of a type entirely different from the well-known cyclic
mysteries, apparently confined to the Passion and Resurrection
and the related events, become known to us for the first time
in the records of this century. Such plays seem to have been
confined to the towns of the south, and, as both their location
and their subject suggest, to the area of the influence of
France. In every event, the records show that they flourished
greatly and that new versions were made from time to time.

Another form of the medieval drama, the Morality Play, had
its origin in the 15th century,—or else very late in the 14th.
The earliest known examples of it in England date from about
1420. These are the Castle of Perseverance and the Pride of Life.
Others belonging to the century are Mind, Will and Understan-
ding, Mankind and Medwall’s Nature. There are also parts of
two plays in the Ludus Comenicis (c. 1450) that are commonly
classed as Morality, and these, together with the existence of
a few personified abstractions in other plays, have led some critics
to suppose that the Morality was derived from the Mystery by
the gradual introduction of personified abstractions in the place of
real persons. But the two kinds of plays are fundamentally
different, different in subject and in technique; and no replace-
ment of real persons by personifications can change a Mystery
into a Morality. Moreover, the Morality text of Mysteries
are later than the origin of the Morality itself and are due to the
influence of the latter. The Morality Play is merely a dramatized
allogegry, and derives its characters and its peculiar technique
from the application of the dramatic method to the allegory,
the favourite literary form of the middle ages. None of the 15th
century Moralties is literature of the first rank, though both the 
Castle of Perseverance and Pride of Life contain passages ringing 
with a passionate sincerity that communicates itself to the 
hearer or reader. But it was not until the beginning of the 16th century that a Morality of permanent human interest appeared in 
Everyman, which, after all, is a translation from the 
Dutch, as is clearly proved by the fact that in the two plays near the end of the play the Dutch has complicated but regular 
structure whereas the English has only irregularly rhythmical 
passages.

Besides the Mysteries and Moralties, the 15th century had also 
Miracle Plays, properly so called, dealing with the lives, martyr-
doms and miracles of saints. As we know these only from 
records of their performance or their mere existence—no texts 
have been preserved to us, except the very curious Play of the 
Sacrament—it is impossible to speak of their literary or dramatic 
qualities. The Miracle Play as a form was, of course, not confined 
to the 15th century. Notwithstanding the assertions of historians 
of literature that it died out in England soon after its introduction 
at the beginning of the 12th century, its existence can be demon-
strated from c. 1100 to the time of Shakespeare. But records 
seem to indicate that it flourished especially during this period 
of supposed barrenness.

What was the nature of the "Comedy of Troilus and 
Parce" that existed before Henry VIII, on the 6th of January 
1516 we have no means of knowing. It is very early indeed 
to assume the influence of either classical or Italian drama, 
and although we have no records of similar plays from the 15th 
century, it must be remembered that our records are scanty, 
that the middle ages applied the dramatic method to all sorts of 
material, and that it is therefore impossible that secular 
plays like this were performed at court in such earlier date. 
The record at any rate does not indicate that it was a new type 
of play, and the Griselda story had been dramatized in 
France, Italy and the Netherlands before 1500.

That not much good prose was written in the 15th century is 
less surprising than that so little good verse was written. The 
technique of verse composition had been studied and mastered 
in the preceding age, as we have seen, but the technique of prose 
had apparently received no serious consideration. Indeed, it is 
doubtful if any one thought of prose as a possible medium of 
artistic expression. Chaucer apparently did not, in spite of the 
comparative excellence of his Preface to the Astrolabe and his 
occasional noteworthy successes with the difficulties of the 
philosophy of Boethius; Wycliffe is usually clumsy; and the 
translators of Mandeville, though they often give us passages 
of great charm, obviously were plain men who merely translated 
as best they could. There was, however, a comparatively large 
amount of prose written in the 15th century, mainly for religious 
or educational purposes, dealing with the same sorts of subjects 
that were dealt with in verse, and in some cases not distinguish-
able from the verse by any feature but the absence of rhyme.

The vast body of this we must neglect; only five writers need 
be named: John Capgrave, Reginald Pecock, Sir John Fortescue, 
Caxton and Malory. Capgrave, the compiler of the first chronicle 
in English prose since the Conquest, wrote by preference in Latin; 
his English is a condescension to those who could not read 
Latin and has the qualities which belong to the talk of an 
earnest and sincere man of commonplace ability. Pecock and 
Fortescue are more important. Pecock (c. 1355-c. 1460) was a 
man of singularly acute and logical mind. He prided himself 
upon his dialectic skill and his faculty for discovering arguments 
that had been overlooked by others. His writings, therefore— 
or at least the Repressor—are excellent in general structure and 
arrangement, his ideas are presented clearly and simply, with 
few digressions or excrescences, and his sentences, though some-
where "vermiform," never degenerate into mere independent prose 
before the age of Elizabeth. His style is lightened by frequent 
figures of speech, mostly illustrative, and really illustrative, of 
his ideas, while his intellectual ingenuity cannot fail to interest 
even those whom his prejudices and preconceptions repel. 
Fortescue, like Capgrave, wrote by preference in Latin, and, like 
Pecock, was philosophical and controversial. But his principal 
English work, the Difference between an Absolute and a Limited 
Monarchy, differs from Pecock's in being rather a pleading than 
a logical argument, and the geniality and glowing patriotism of 
its author give it a far greater human interest.

No new era in literary composition was marked by the activity 
of William Caxton as translator and publisher, though the printing-
press has, of course, changed fundamentally the problem of 
discrimination and purification of literature. Caxton's work 
exerted an ultimate effect on literary production profoundly. But 
neither Caxton nor the writers whose works he printed produced anything 
in new form or spirit. His publications range over the whole 
field of 15th century literature, and no doubt he tried, as his 
quaint prefaces indicate, to direct the public taste to what was 
best among the works of the past, as when he reprinted 
the Canterbury Tales, but among all his numerous 
publishations not one is the herald of a new era. The only book of 
permanent interest as literature which he introduced to the 
world was the Mort D'Arthur of Sir Thomas Malory, and this is a 
collection from older romances (see Arthurian Legend). 
It is, to be sure, the one book of permanent literary significance 
produced in England in the 15th century; it glows with the 
warmth and beauty of the old knight's conception of chivalry 
and his love for the great deeds and great men of the visionary 
past; it adheres continually to the personal and 
unpretentious reader by its fresh and vivid 
diction and by a syntax which, though sometimes faulty, has 
almost always a certain naive charm; "thostorye (i.e. the 
history) of the sayd Arthur," as Caxton long ago declared, "is 
so glorious and shynynge, that he is stalleth in the first place 
of the most noble, beste and worthiest of the Cristen men"; 
It is not, however, as the first of a new species, but as the final 
flower of an old that this glorious and shining book retains its 
place in English literature.

Whatever may have been the effect of the wars and the growth 
of industrial life in England in withdrawing men of the best 
abilities from the pursuit of literature, neither these causes 
nor any other interfered with the activity of writers of lesser 
powers. The amount of writing is really astonishing, as is also 
its range. More than three hundred separate works (exclusive 
of the large number still ascribed to Lydgate and of the seventy 
printed by Caxton) have been made accessible by the Early 
English Text Society and other public or private pressers, and 
it seems probable that an equal number remains as yet 
unpublished. No list of these writings can be given here, but it 
may not be unprofitable to indicate the range of interests by 
noting the classes of writing represented. The classification is 
necessarily rough, as some writings belong to more than one 
type. We may note, first, love poems, allegorical and un-
alllegorical; narrative, didactic, lyrical and quasi-lyrical; poems 
that commemorate historical events and exalt some sort of 
subject; verses of daily use, for fairs, harvests, and festivals; 
tales of entertainment or instruction, in prose and in verse; 
histories ancient and modern, and brief accounts of 
recent historical events, in prose and in verse; prose romances 
and metrical romances; legends and lives of saints, in prose and 
in verse; poems and prose works of religious meditation, 
devotion and controversy; treatises of religious instruction, 
in prose and in verse; ethical and philosophical treatises, both 
theoretical and practical; treatises of government, of 
political economy, of foreign travel, of hygiene, of surgery, of 
alchemy, of heraldry, of hunting and hawking and fishing, of 
farming, of good manners, and of cooking and carving. Prosaic 
and intended merely to serve practical uses as many of these 
were, verse is the medium of expression as often as prose. Besides 
this large amount and variety of English compositions, it must 
be remembered that much was also written in Latin, and that 
the Latin and French works of this and other centuries were read by 
the educated classes.

Although the intellectual and spiritual movement which we 
call the Italian Renaissance was not unknown in England in the 
14th and 15th centuries, it is not strange that it exercised no 
perceptible influence upon English literature, except in the case of 
Chaucer. Chaucer was the only English man of letters before
the 16th century who knew Italian literature. The Italians who visited England and the Englishmen who visited Italy were interested, not in literature, but in scholarship. Such studies as were pursued by Free, Grey, Fleming, Tilly, Gunthorpe and others who went to Italy, made them better grammarians and rhetoricians, and no doubt gave them a freer, wider outlook, but upon their return to England they were immediately absorbed in administrative cares, which left them little leisure for literary composition, even if they had had any inclination to write. They prepared the way, however, for the leaders of the great intellectual awakening which began in England with Linacre, Colet, More and their fellows, and which finally culminated in the age of Spenser, Bacon, Shakespeare, Jonson, Gilbert, Harvey and Harriott.

When the middle ages ceased in England it is impossible to say definitely. Long after the new learning and culture of the Renaissance had been introduced there, long after classical and Italian models were eagerly chosen and followed, the epic and lyric models of the Middle Ages were admired and imitated, and the ancient forms of the drama lived side by side with the new until the time of Shakespeare himself. John Skelton, although according to Erasmus "unum Britannicarum literarum lumen ac decus," and although possessing great originality and vigour both in diction and in invention when attacking his enemies or indulging in playful rhyming, was not only a great admirer of Lydgate, but equaled even the worst of his predecessors in inaccurate pedantry of diction, in complicated impossibilities of syntax, and in meaningless inversions of word-order whenever he wished to write elegant and dignified literature. And not a little of the absurd diction of the middle of the 16th century is merely a continuation of the bad ideals and practices of the refined writers of the 15th.

In fine, the 15th century has, aside from its vigorous, though sometimes coarse, popular productions, little that can interest the lover of literature. It offers, however, in richest profusion, problems for the literary antiquarian and the student of the relations between social conditions and literary productivity,—problems which have usually been attacked only with the light weapons of irresponsible speculation, but which may perhaps be solved by a careful comparative study of many literatures and many periods. Moreover, although in the quality of its literary output it is decidedly inferior to the 16th century, the amount and the wide range of its productions indicate the gradual extension of the habit of reading to classes of society that were previously unlettered; and this was of great importance for the future of English literature, just as the innumerable dramatic performances throughout England were important in developing audiences for Marlowe and Shakespeare and Beaumont and Fletcher.

For bibliography see vol. ii. of the Cambridge History of Literature (1890) and Millet's *Geschichte der englischen Literatur* (1871). The latter is an excellent, if a little antiquated work. Courthoe's and Morley's (J. M. Ma.)

III. Elizabethan Times

**General Influences, and Prologue to 1579.**—The history of letters in England from More's *Utopia* (1516), the first Platonic vision, to Milton's *Samson Agonistes* (1671), the latest classic tragedy, is one and continuous. That is the period of the English Renaissance, in the wider sense, and it covers all and more of the literature loosely called "Elizabethan." With all its complexity and subdivisions, it has as real a unity as the age of Pericles, or that of Petrarch and Boccaccio, or the period in Germany that includes both Lessing and Heine. It is peculiar in length of span, in variety of power, and in wealth of production, though its master-works on the greater scale are relatively few. It distinguishes itself never quite cut off, from the middle age preceding, and also from the classical or "Augustan" age that followed. The coming of Dryden denoted a new phase; but it was still a phase of the Renaissance; and the break that declared itself about 1660 counts as nothing beside the break with the middle ages; for this implied the whole change in art, thought and temper, which re-created the European mind. It is true that many filaments unite Renaissance and middle ages, not only in the religious and purely intellectual region, but in that of art. The matter of Geoffrey of Monmouth, the tales of Arthur and of Troilus, the old fairy folklore of the South, the topic of the *Falls of Princes*, lived on; and so did the characteristic medieval form, allegory and many of the old metres of the 14th century. But then these things were transformed, often out of knowledge Shakespeare's use of the histories of Macbeth, Lear and Troilus, and Spenser's of the allegoric romance, are examples. And when the gifts of the middle ages are not transformed, as in the *Mirror for Magistrates*, they strike us as survivals from a lost world.

So vital a change took long in the working. The English Renaissance of letters only came into full flower during the last twenty years of the 16th century, later than in any Southern land; but it was all the richer for delay, and would have missed many a life-giving element could it have been driven forward sooner. If the actual process of genius is beyond analysis, we can still notice the subjects which genius receives, or chooses, to work upon, and also the vestige which it chooses for them; and we can watch some of the forces that long retard but in the end fertilize these workings of genius.

What, then, in England, were these forces? Two of them lie outside letters, namely, the political settlement, culminating in the death of Elizabeth, and the religious settlement, whereby the Anglican Church grew out of the English Reformation. A third force lay within the sphere of the Renaissance itself, in the narrower meaning of the term. It was culture—the preatory work of culture and education, which at once prepared and put off the flowering of pure genius. "Elizabethan" literature took its complexion from the circumstance that all these three forces were in operation in the 16th century. The Church began to be fully articulate, just when the national feeling was at its highest, and the tide of classical and immigrant culture were strongest. Spenser's *Faerie Queene*, Hooker's *Ecclesiastical Polity* and Shakespeare's *Henry V* came in the same decade (1590–1600). But these three forces, political, religious and educational, were of very different duration and value. The enthusiasm of 1590–1600 was already dying down in the years 1600–1610, when the great tragedies were written; and soon a wholly new set of political forces began to tell on art. The religious inspiration was mainly confined to certain important channels; and literature as a whole, from first to last, was far more secular than religious. But Renaissance culture, in its ramifications and consequences, tells all the time and over the whole field, from 1500 to 1660. It is this culture which really binds together the long and varied chronicle. Before passing to narrative, a short review of each of these elements is requisite.

Down to 1579 the Tudor rule was hardly a direct inspiration to authors. The reign of Henry VII. was first duly told by Bacon, and that of Henry VIII. staged by Shakespeare and Fletcher, in the time of James I. Sir Thomas More found in Roper, and Wolsey in Cavendish, sound biographers, who are nearly the earliest in the language. The later years of Henry VIII. were full of episodes too tragically picturesque for safe housing in the lifetime of his children. The next two reigns were engrossed with the religious war; and the first twenty years of Elizabeth, if they laid the bases of an age of peace, well-being, and national self-confidence that was to prove a teeming soil for letters, were themselves poor in themes for patriotic art. The abortive treason of the northern earls was echoed only in a ringing ballad. But the voyagers, freebooters, and explorers reported their experiences, as a duty, not for fame; and these, though not till the golden age, were edited by Hakluyt, and the book wing from the "Indian Peru" to the "still-vexed Bermoothes." Yet, in default of any true historian, the queen's wise delays and diplomacies that upheld the English power, and her refusal to launch on a Protestant or a national war until occasion compelled and the country
was ready, were subjects as uninspiring to poets as the burning questions of the royal marriage or the royal title. But by 1580 the nation was filled with the sense of Elizabeth's success and greatness and of its own prosperity. No shorter struggle and no less achievement could have nursed the insolent, jubilant patriotism of the years that followed; a feeling that for good reasons was peculiar to England among the nations, and created the peculiar forms of the chronicle play and poem. These were borne neither from antiquity nor from abroad, and were never afterwards revived. The same exultation found its way into the current forms of ode and pastoral, of masque and allegory, and into many a dedication and interlude of prose. It was so strong as to outlive the age that gave it warrant. The passion for England, the passion of England for herself, animates the bulk of Drayton's Pol-Oblis, which was finished so late as 1622. But the public issues were then changing, the temper was darker; and the civil struggle was to speak less in poetry than in the prose of political theory and ecclesiastical argument, until its after-explosion came in the verse of Milton.

The English Reformation, so long political rather than doctrinal or imaginative, cost much writing on all sides; but no book like Calvin's Institution is its trophy, at once defining the religious change for millions of later men and marking a term of departure in the national prose. Still, the debating weapons, the axes and billhooks, of vernacular English were—somewhat jaggedly—in the pamphlet battles that dwarfed the original energies of Sir Thomas More and evoked those of Tyndale and his friends. The powers of the same style were proved for descriptive economy by Starkey's Dialogue between Pole and Lupset, and for religious appeal by the blunt sound rhetorical and forthright jests in the sermons of Latimer (died 1555). Foxe's reports of the martyr's are the type of early Protestant English (1563); but the reforming divines seldom became real men of letters even when their Puritanism, or discontent with the final Anglican settlement and its temper, began to announce itself. Their spirit, however, comes out in many a corner of poetry, in Gascoigne's Steel Glass as in Spenser's Shepherd's Calendar; and the English Reformation lived partly on its pre-natal memories of Langland as well as of Wycliffe. The fruit of the struggle, though retarded, was ample. Carrying on the work of Fisher and Cranmer, the new church became the nursing mother of English prose, and trained it more than any single influence—trained it so well, for the purposes of sacred learning, translation and oratory, and also as a medium of poetic feeling, that in these activities England came to rival France. How late any religious writer of true rank arose may be seen by the lapse of over half a century between Henry VIII's Act of Supremacy and Hooker's treatise. But after Hooker the chain of eloquent divines was unbroken for a hundred years.

Renaissance culture had many stages and was fed from many streams. At the outset of the century, in the wake of Erasmus, under the teaching of Colet and his friends, there spread a sounder knowledge of the Greek and Latin tongues, of the classic texts, and so of the ancient life and mind. This period of humanism in the stricter sense was far less brilliant than in Italy and France. No very great scholar or satirist of poetry and prose for a long time; except that the satellite of scholarship, shone brightly in George Buchanan. But scholarship was created and secured; and in at least one, rather solitary, work of power, the Utopia (which remained in Latin till 1551), the fundamental process was begun which appropriates the Greek mind, not only for purposes of schooling, but as a source of new and independent thinking. In and after the middle of the century the classics were again put forward by Chiche, by Wilson in his Art of Rhetoric (1553), and by Ascham in his letters and in his Schoolmaster (1570), as the true staple of humane education, and the pattern for a simple yet lettered English. The literature of translations from the classics, in prose and verse, increased; and these works, at first plain, business-like, and uninspired, slowly rose in style and power, and, like the translations from modern tongues, were written by a series of masters of English, who thus introduced Plutarch and Tacitus to poets and historians. This labour of mediation was encouraged by the rapid expansion and reform of the two universities, of which almost every great master except Shakespeare was a member; and even Shakespeare had ample Latin for his purpose.

The direct impact of the classics on 'Elizabethan' literature, whether through such translations or the originals, would take long to describe. But their indirect impact is far stronger, though in result the two are hard to discern.

This is another point that distinguishes the English Renaissance from the Italian or the French, and makes it more complex. The knowledge of the thought, art and enthusiasm of Rome and Athens constantly came round through Italy or France, tinted and charged in the passage with something characteristic of those countries. The early playwrights read Seneca in Latin and English, but also the foreign Senecan tragedies. Spenser, when starting on his pastorals, studied the Sicilians, but also Sannazaro and Marot. Shakespeare saw heroic antiquity through Plutarch, but also, surely, through Montaigne's reading of antiquity. Few of the poets can have distinguished the original fountain of Plato from the canalized supply of the Italian Neoplatonists. The influence, however, of Cicero on the Anglican pulpit was immediate as well as constant; and so was that of the conciser Roman masters, such as Seneca and Tacitus, and the scattered examples only intimate the existence of two great chapters of English literary history—the effects of the classics and the effects of Italy. The bibliography of 16th-century translations from the Italian in the fields of political and moral speculation, poetry, fiction and the drama, is so large as itself to tell part of the story. The genius of Italy served the genius of England in three distinctive ways. It inspired the recovery, with new models of the lost music and a lost prose style. It modelled many of the chief poetic forms, which soon were developed out of recognition; such were tragedy, allegory, song, pastoral and sonnet. Thirdly, it disclosed some of the master-thoughts upon government and conduct formed both by the old and the new Mediterranean world. Machiavelli, the student of ancient Rome and modern Italy, riveted the creed of Bacon. It might be said that never has any modern people so influenced another in an equal space of time—and letters, here as ever, are only the voice, the symbol, of a whole life and culture—if we forgot the sway of French in the later 17th and 18th centuries. And the power of French was alive also in the 16th. The track of Marot, of Ronsard and the Pleiad and Desportes, of Rabelais and Calvin and Montaigne, is found in England. Journeymen like Boisseau and Belleforest handed on immortal tales. The influence is noteworthy of Spanish manners, chief of all Guevara upon sententious prose, and of the novelists and humorists, headed by Cervantes, upon the drama. German legend is found not only in Marlowe's Faustus, but in the byways of play and story. It will be long before the rich and coloured tangle of these threads has been completely unravelled with due tact and science. The presence of one strand may here be mentioned, which appears in unexpected spots.

As in Greece, and as in the day of Coleridge and Shelley, the fashion of the poet and prose shot through with philosophical ideas; a further distinction from other literatures like the Spanish of the golden age or the French of 1830. But these were not so much the ideas of the new physical science and of Bacon as of the ethical and metaphysical ferment. The wave of free talk in the circles of Marlowe, Greville and Raleigh ripples through their writings. Though the direct influence of Giordano Bruno on English writers is probably limited to a reminiscence in the Faerie Queene (Book vii.), he was well acquainted with Sidney and Greville, argued for the Copernican theory at Greville's house, lectured on the soul at Oxford, and published his epomarking Italian dialogues during his two years' stay (1583–1585) in London. The debates in the earlier schools of Italy on the nature and tenure of the soul are heard in the
Nurse Teigteum (1590) of Sir John Davies; a stoicism, "of the schools" as well as "of the blood," animates Cassius and also the French heroes of Chapman; and if the earlier drama is sown with Seneca's old maxims on sin and destiny, the later drama, at least in Shakespeare, is penetrated with the freer reading of life and conduct suggested by Montaigne. Platonism—with its own amorphous shape in classical form, which verse had been

Hymns of Spenser to the last followers of Donne; sometimes drawn from Plato, it is often the Christianized doctrine codified by Ficino or Pico. It must be noted that this play of philosophic thought only becomes marked after 1580, when the preparatory tunings of English literature are over.

We may now quickly review the period down to 1580, in the departments of prose, verse and drama. It was a time which left few memorials of form.

Early modern English prose, as a medium of art, was of slow growth. For long there was alternate strife and union (ending in marriage) between the Latin, or more rhetorical, and the ancestral elements of the language, and this was true both of diction and of construction. We need to begin with the talk of actual life, as we find it in the hands of the more naf writers, in its idioms and gusto and unashamed power, to see how style gradually declared itself. In state letters and reports, in the recorded words of Elizabeth and Mary of Scotland and public men, in travels and memoirs, in Latimer, in the rude early versions of Cicero and Boethius, in the more unstudied speech of Ascham or Leland, the material lies. At the other extreme there are the English liturgy (1549, 1554, 1559, with the final fusion of Anglican and Puritan eloquence), and the sermons of Fisher and Cranmer,—nearly the first examples of a sinuous, musical and Ciceronian cadence. A noble pattern for saga-narrative and lyrical prose was achieved in the successive versions (1526-1540-1568) of the Hebrew and Greek Scriptures, where a native simple diction of short and melodious clauses are prescribed by the matter itself. Prose, in fact, down to Shakespeare's time, was largely the work of the churchmen and translators, aided by the chroniclers. About the mid-century the stories, as well as the books of conduct and maxims, drawn from Italy and France, begin to thicken. Perverted symmetry of style is found in euphuistic hacks like Pettie. Painter's Palace of Pleasure (1566) provided the plots of Bandello and others for the dramatists. Hob's version (1561) of Castiglione's Courtier, with its command of elate and subtle English, is the most notable imported book between Berners' Fressorari (1523-1525) and North's Plutarch (1559). Ascham's Schoolmaster is the most typical English book of Renaissance culture, in its narrower sense, since Utopia. Holinshed's Chronicle (1577-1587) and the work of Halle, if pre-critical, were all the better for Shakespeare.

The lyric impulse was flegded anew at the court of Henry VIII. The short lines and harping burdens of Sir Thomas Wyatt's songs show the revival, not only of a love-poetry more plangent than anything in English since Chaucer, but also of the long-deadened sense of metre. In Wyatt's sonnets, tercets, terzines and other Italian measures, we can watch the painful triumphant struggles of this noble old master out of the slough of formlessness in which he was left by Sidney. Wyatt's primary deed was his gradual rediscovery of the iambic decasyllabic line dully accentted—the line that had been first discovered by Chaucer for England; and next came its building into sonnet and stanza. Wyatt (d. 1554) ended with perfect formal accuracy; he has the honours of victory; and Henry Howard, earl of Surrey (d. 1547), a younger-hearted and more gracious but a lighter poet, carried on his labour, and caught some of Chaucer's as well as the Italian and the tinctures of his own age. Amoretti, like all that written previous to Peele, gave little inkling of the latencies of the measure which was to become the cardinal one of English poetry. It was already the vogue in Italy for translations from the classics; and we may think of Surrey importing it like an uncut jewel and barely conscious of its value. His original poems, like those of Wyatt, waited for print till the eve of Elizabeth's reign, when they appeared, with those of followers like Grimald, in Tottel's Miscellany (1557), the first of many such garlands, and the outward proof of the poetical revival dating twenty years earlier. But this was a false dawn. Only one poem of authentic power, Sackville's Induction (1563) to that dreary patriarchic venture, A Mirror for Magistrates, was written within the first quarter of a century; perhaps about 1570: the gates of hell and of the kings in bale achieves a new melody and a new intensity, and makes the coming of Spenser far less incredible. But poetry was long starved by the very ideal that it nutured—that of the all-sided, all-accomplished "courtier" or cavalier, to whom verse-making was but one of all the accomplishments that he must perfect, like fencing, or courting, or equestrian skill. Wyatt and Surrey, Sackville and Sidney (and we may add Hamlet, a true Elizabethan) are of this type. One of the first competent professional writers was George Gascoigne, whose remarks on metric, and whose blank verse satire, The Steel Glass (1576), saves the years between Sackville and Spenser. Otherwise the gap is filled by painful rhymesters with rare flashes, such as Googe, Churchyard and Turberville.

The English Renaissance drama, both comic and tragic, illustrates on the large scale the characteristic power of the antique at this period—at first to reproduce itself in imitation, and then to generate something utterly different from itself, something that throws the antique to the winds. Out of the Morality, a sermon upon the certainty of death or the temptations of the soul, acted by personified qualities and supernatural creatures, had grown up, in the reign of Henry VII., the Interlude, a dialogue spoken by representative types or trades, who faintly recalled those in Chaucer's Prologue. These forms, which may be termed medieval, continued long and blended; sometimes heated, as in Rempuda, with doctrine and usually lightened by the comic play of a "Vice" or incarnation of sinister roguery. John Heywood was the chief maker of the pure interludes, and Bishop Bale of the Protestant medleys; his King Johan, a reformer's partisan tract in verse, contains the germs of the chronicle play. In the drama down to 1580 the native talent is sparse enough, but the historical interest is high. Out of a seeming welter of forms, the structure, the metres and the species that Kyd and Marlowe found slowly emerged. Comedy was first delivered from the interlude, and fashioned in essence as we know it, by the schoolmasters. Drawing on Plautus, they constructed duly-knitted plots, divided into acts and scenes and full of homely native fun, for their pupils to present. In Thersites (written 1537), the oldest of these pieces, and in Udall's Ralph Roister Doeister (1532-1537), the best known of them, the characters are lively, and indeed are almost individuals. In others, like Misogonus (written 1560), the exact elements of the real English comedy are in fact elements of the source is partly neo-Latin comedy, native or foreign. Romance crept in: serious comedy, with its brilliant future, the comedy of high sentiment and averted dangers mingled still with farce, was shadowed forth in Damon and Pthikias and in the curious play that played Common Conditions; while the domestic comedy of intrigue dawnt in Gascoigne's Supposes, adapted from Ariosto. Thus were displaced therank rustic fun of Gammer Gartin's Epistle (written c. 1550) and other labours of "rhyming motherwits." But there was no style, no talk, no satisfactory metre. The verse of comedy waited for Greene, and its prose for Lyly. Structure, without style, was also the main achievement of the early tragedies. The Latin plays of Buchanan, sometimes biblical in topic, rest, as to their form, upon Euripides. But early English tragedy was shaped after the Senecan plays of Italy and after Seneca himself, all of whose dramas were translated by 1581. Gorboduc, or The Praise of Virtue (written c. 1568), and Sinne, written by Sackville and Norton, and Hughes' Misfortunes of Arthur (acted 1588), are not so much plays as wraiths of plays, with their chain of slaughters and revenges, their two-dimensional personages, and their lifeless maxims which fail to sweeten the bloodshot atmosphere. The Senecan form was not barren in itself, as its sequel in France was to show: it was only barren for England. After Marlowe it was driven to the study, and was...
still written (possibly under the impulse of Mary countess of Pembroke), by Daniel and Greville, with much reminiscence of the French Senecans. But it left its trail on the real drama. It is still a part of the history of French literature. For its high tragic tone, its “unchecked” quality, its “glowing light much like the shade,” pace his figures on horseback, or in daring, with their clear and pictorial allegoric trappings; and they go either singly, or in his favourite masques or pageants, suggested by emblematical painting or civic procession. He is often duly praised for his lingering and liquid melodies and his gracious images, or blamed for their languour; but his ground-tone is a sombre melancholy—unlike that of Jaques—and his deepest quality as a writer is his angry power. Few of his forty and more thousand lines are unpoetical; in certainty of style, amongst English poets who have written profusely, he has no equals but Chaucer, Milton and Shelley. His “artificial” diction, drawn from middle English, from dialect or from false analogy, has always the intention and nearly always the effect of beauty; we soon feel that its absence would be unnatural, and it has taken its rank among the habitual and exquisite implements of English poetry. This equality of noble form is Spenser’s strength, as dilution and diffusion of phrase, and a certain monotonous slowness of tempo, are beyond doubt his weaknesses. His chief technical invention, the nine-line stanza (aababcC) was developed not from the Italian octave (aababc), but by adding an alexandrine to the eight-line stave (aababcC) of Chaucer’s Monk’s Tale. It is naturally articulated twice—at the fifth line, where the turn of repeated rhyme inevitably occurs, and at the ninth, which runs now to a crashing climax, now to a pensive and sighing close. In rhythm, Spenser, if not always accurate, is one of the most natural and resourceful of poets. His power over the heroic couplet or quatrain is shown in his fable, Mother Hubbard’s Tale, and in his curious verse memoir, Colin Clout; both of which are medleys of satiric and flattery. With formal tasks so various and so hard, it is wonderful how effortlessly the style of Spenser remains. His Musiopomas is the lightest-handed of mock-heroics. No writer of his day except Marlowe was so faithful to the law of beauty.

The mantle of Spenser fell, somewhat in shreds, upon poets of many schools until the Restoration. As though in thanks to his master Tasso, he lent to Edward Fairfax, the best translator of the Jerusalem Delivered (Godfrey of Bulloghe, 1600), some of his own ease and intricate melody. Harington, the witty translator of Ariosto (1597) and spoilt child of the court, owed less to Spenser. The allegorical manner, which was nobly aspiring at the time, is called back. Christ’s Victory and Triumph of the younger Giles Fletcher (1610), and Spenser’s emblematic style was strained, even cracked, by Phineas Fletcher in The Purple Island (1632), an aspiring fable, gorgeous in places, of the human body and faculties. Both of these brethren clipped and marred the stanza, but they form a link between Spenser and their student Milton.

The allegoric form, long-winded and broken-backed, survived late in Henry More’s and Joseph Beaumont’s verse disquisitions on the soul. Spenser’s pastoral and allusive manner was allowed by Drayton in his Shepherd’s Garland (1593), and differently by William Browne in Britannia’s Pastoral (1613-1616), and by William Basse; while his more honeyed descriptions took on a mawkish taste in the anonymous Britain’s Ida and similar poems. His golden Platonic style was buoyantly echoed in Orchestra (1596), Sir John Davies’ poem on the dancing spheres. He is continually traceable in 17th-century verse, blending with the alien currents of Ben Jonson and of Donne. He was edited and imitated in the age of Thomson, in the age of William Morris, and constantly between.

The typical Elizabethan poet is Michael Drayton; who followed Spenser in pastoral, Daniel, Sidney, Spenser and Shakespeare in sonnet, Daniel again in chronicle and legend, and Marlowe in mythological story, and who yet remained himself. His Endimion and Phoebus and only true stories stands near the heart of a generation. England’s Heroical Epistles (1597) are in ringing rhetorical couplets; his Odes (1606), like the Ballad of Agincourt and the
Virginian Voyage, forestall and equal Cowper's or Campbell's; his Poly-Olbion (1612-1622), was the most popular of burlesque epic poems; and his pastoral are full of grace and felicities. The work of Drayton that is least read and most often mentioned is his Meteorologia (1593), which was a vast and pious effort, now and then nobly repaid, to versify the scenery, legend, customs and particularities of every English county. The more recluse and pensive habit of Samuel Daniel chills his long chronicle poems; but with Chapman he is the clearest voice of Stoicism in Elizabethan letters; and his harmonious nature is perfectly expressed in a style of eloquent and excellent verse. Shakespeare's "goodness" and from strain. Sonnet and epistle are his favourite forms, and in his Musophilus (1590) as well as in his admirable prose Defence of Rhyme (1602), he truly prophesies the hopes and glories of that illustre vulgare, the literary speech of England. All this patriotic and historic verse, like the earlier anduder Albion's England (1586) of William Warner, or Fitzgeorgey's poem upon Drake, or the outburst of Spenser, was written during or inspired by the last twenty years of the queen's reign; and the same is true of Shakespeare's and most of the other history plays, which duly eclipsed the formal, rustic-gray-cloak poem of the type of the Mirror for Magistrates, though editions (1599-1610) of the latter were long repeated. Patriotic verse outside the theatre, however, full of zeal, started at a disadvantage compared with love-sonnet, song, or mythical narrative, because it had no models before it in other lands, and remained therefore the more shapeless.

The English love-sonnet, brought in by Wyatt and rife between 1590 and 1600, was revived as a purely studious imitation by Watson in his Iesekamophatia (1582), a string of translations in one of the exceptional measures that were freely entitled "sonnets." But from the first, in the hands of Sidney, whose Astrophel and Stella (1591) was written, as remarked above, about 1581, the sonnet was ever ready to pulse into feeling, and to flash into unburdened beauty, embodying sometimes dramatic fancy and often living experience. These three fibres of imitation, imagination and confession are interwoven. This is a wonderful fertility of lyrical pattern, a wonderfully diffused power of lyrical execution, to recur at any later time of English literature. Wyatt had to recover the very form of such verse from oblivion, and this he did in the school of craftsmanship, not only in the decasyllabic, but the lyric, in short lines had almost died out of memory, and Wyatt brought it back. From his day to Spenser's there is not much lyric that is noteworthy, though in Gascoigne and others the impulse is seen. The introduction of Italian music, with its favourite metrical schemes, such as the madrigal, worthily schooled and coloured lyric: in especial, the caressing double ending, regular in Italian but heavier in English, became common. The Italian poems were often translated in their own measure, line by line, and the musical setting retained. Their tunes, or other tunes, were then coupled with new and original poems; and both are brought together in the books of Henry Constable's Diaries (1592); so the sonnet is further enriched by the sonnet of Jones and Byrd (1588), and in chief (1601-1619) of Thomas Campion. The words of Campion's songs are not only supremely musical in the wider sense, but are chosen for their singing quality. Misled awhile by the heresy that rhyme was wrong, he was yet a master of lovely rhyming, as well as of a lyrical style of great range, gaily or gravely happy. But, as with most of his fellows, singing is rather his calling than his consolation. The lyrics that are sprinkled in plays and songs are the finest of this period, and perhaps, in their kind, of any period. Shakespeare is the greatest in this province also; but the power of infallible and unforgettable song is often granted to slighter, gentler playwrights like Greene and Dekker, while it is denied to men of weightier build and stern purpose like Chapman and Jonson. The songs of Jonson are indeed at their best of absolute and antique finish; but the irrepealable dews of night or dawn seldom lies upon them as it lies on the songs of Webster or of Fletcher. The best lyrics in the plays are dramatic; they must be read in their own setting. While the action stops, they seize and daily with the dominant emotion of the scene, and yet relieve it. The songs of Lodge and Breton, of Drayton and Daniel, of Oxford and Raleigh, and the fervid brief flights of the Jesuit Southwell, show the omnipresence of the vital gift, whether among professional writers of the journalistic type, or among poets whose gift was not primarily song, or among men of action and quality or men of letters, as the case may be. But Song and Love were not only lubbery and valentine and compliment, and love-plaint ranging from gallantry to desperation, are all there;
and the Fortunate Hour, which visits commonly only a few men in a generation, and those but now and then in their lives, is never far off. But the master of melody, Spenser, left no songs, apart from his two inexpressible wedding odes. And religious lyric is rarer before the reign of James. Much of the best lyric is saved for us by the various Miscellanies, *A Handful of Pleasant Delights* (1597), *Phases of English Poetry* (1601), *Rhapsody* (1602); while other such collections, like England's *Hecicon* (1600), were chiefly garlands of verse that was already in print.

There is plenty of satiric anger and raillery in the spirit of the time, but the most genuine part of it is drawn off into drama. Except for stray passages in Spenser, Drayton and others, formal satire, though profuse, was a literary unreal thing, a pose in the manner of Persius or Juvenal, and tiresome in expression. In this kind only Donne triumphed. The attempts of Lodge and Hall and Marston and John Davies of Hereford and Guilpin and Wither are for the most part simply weariful in different ways, and satire waited for Dryden and his age. The attempt, however, persisted throughout. Wyatt was the first and last who succeeded in the genre, natural Horatian style.

*Verse from Donne to Milton*.—As the age of Elizabeth receded, some changed the key over to more dramatic verse. In John Donne (1573–1631), one of the greater poets of the age, and in many writers after Donne, may be traced a kind of Counter-Renaissance, or revulsion against the natural man and his claims to pleasure—a revulsion from which regret for pleasure lost is seldom far. Poetry becomes more ascetic and mystical, and this feeling takes shelter alike in the Anglican and in the Roman faith. George Herbert (*The Temple*, 1633), the most popular, quaint and pious of the school, but the least poetical; Crashaw, with his ecstatic vision (*The Planning Heart*) and occasional golden stanzas; Henry Vaughan, who wrote from 1646 to 1678, with his mystical landscape and magical cadences; and Thomas Traherne, his fellow-dreamer, are the best known of the religious Fantastics. But, earlier than most of these are Lord Herbert of Cherbury, and Habington with his *Castara* (1634), who show the same temper, if a licterful and felicity. Such writers form the devouter section of the famous "metaphysical" or "fantastic" school, which includes, besides Donne its founder, pure amorettes like Carew (whose touch on certain rhythms has no fellow), young academic followers like Cartwright and Cleveland (in whom survives the vein of satire that also marks the school), and Abraham Cowley, who wrote from 1633 to 1678, and was perhaps the most acceptable living poet about the middle of the century. In his *Life of Cowley* Johnson tramples on the "metaphysical" poets and their vices, and their vices, partly English, partly artificial, and stand far above his pious works, and still further above the dreary satires which he lived to continue after the Restoration.

Of poets yet unmentioned, Robert Herrick is the chief, with his two thousand lyrics and epigrams, gathered in *Hesperides and Noble Numbers* (1648). His power of song and sureness of cadence are not excelled within his range of topic, which includes flowers and maidens—whom he treats as creatures of the same race—and the swift decay of both their beauties, and secular regret over this decay and his own mortality and the transience of amorous pleasure, and the virtues of his friends, and country sports and lore, and religious compunction for his own paganism. The *Hesperides* are pure Renaissance work, in natural sympathy with the Roman elegiac writings and with the Pseudo-Anacreon. Cowley is best where he tops Herrick, and has more sweetness of fancy and power of device, but not the same genuine invention and the same happy art. There are many writers who last by virtue of one or two poems; Suckling by his adept playfulness, Love-lace and Montrose by a few gallant stanzas, and many a nameless poet by many a consummate cadence. It is the age of sudden flights and brief perfections. All the farther out of reach, yet never wholly despised of or unattempted in England, was the "long poem," heroic and noble, the "phantom epic," that shadow of the ancient masterpieces.
which had striven to life in Italy and France. Davenant's
Gondibert (1651), Cowley's Davidick and Chamberlayne's Pharon-
mita (1659) attest the effort which Milton in 1658 resumed with
triumph. These works have between them all the vices possible
to epic verse, dulness and flatness, faintness and quinquity and
incoherence. But there is some poetry in each of them, and in
Pharamnida there is far more than enough poetry to save it.
Few writers have found a flawless style of their own so early
in life as John Milton (1608-1674). His youthful pieces show
some signs of both Spenser and the Caroline fantasies;
but so soon his vast poetical reading ran clear and lay at
the service of his talent. His vision and phrasing of natural
things were already original in the Nativity Ode, written when he
was twenty; and, there also, his versification was already that
of a master, of a renovator. The pensive and figured beauty of
L'Allegro and Il Penseroso, two contrasted emblematic panels,
the high innocent Flatonism and golden blank myth of the
Comus (1634); the birth of long-sleeping power in the Lycidae,
(1637), with its unapproached contrivance both in evolution and
detail, where the precious essences of earlier myth and
pastoral seem to be distilled for an offering in honour of the
tombless friend,—the newness, the promise, the sureness of
it all amid the current schools! The historian finds in these
poems, with their echoes of Plato and Sannazzaro, of Geoffrey
of Monmouth and St John, the richest and most perfect instance
of the studious, decorative Renaissance style, and is not surprised
to see in them a Germanic lanmary, but indeed a
Germanic lanmary, the age of the Augustan
The critic, while feeling that the strictly lyrical, spontaneous
element is absent, is all the more baffled by the skill and enduring
charm. The sonnets were written before or during Milton's
long immemor (1637-1658) in prose and warfare, and show the
same gifts. They are not cast in the traditional form of love-
cycle, but are occasional poems; in metre they revert, not always
strictly but once or twice in full perfection, to the Italian scheme;
and they recall not Petrarch but the spiritual elegies or patriotism
exaltations of Dante and Guidiccioni.
Milton also had a medieval side to his brain, as the History of
Brittain shows. The heroic theme, which he had resolved from
his youth up to celebrate, at last, after many hesitations, proved
to be the fall of man. This, for one of his creed and for
the audience he desired, was the greatest theme of all. Its scene
was the Ptolemaic universe with the Christian heaven and hell
inserted. The time, indicated by retrospect and prophecy,
was the whole of that portion of eternity, from the creation of
Christ to the doomsday, of which the history was sacrely
revealed. The subject and the general span of the action went
back to the popular mystery play; and Milton at first planned
out Paradise Lost as such a play, with certain elements of classic
tragedy embodied. But according to the current theory the epic,
not the drama, was the noblest form of verse; and, feeling
where his power lay, he adopted the epic. The subject, therefore,
was partly medieval, partly protestant,—for Milton was a true
Protestant in having a variant of doctrine shared by no other
mortal. But the ordering and presentment, with their overture,
their interpolated episodes or narratives, their journeys between
Olympus, Earth and hell, invocations, set similes, battles and
divine thunderbolts, are those of the classical epic. Had Milton
shared the free thought as well as the scholarship of the Renaiss-
ance, the poem could never have existed. With all his range of
soul and skill, he had a narrower speculative brain than any
poet of equal gift; and this was well for his great and peculiar
task. But whatever Milton may fail to be, his heroic writing is
the permanent and absolute expression of something that in
the English stock is ineretan—the Promethean self-posses-
ion of the mind in defeat, its right to solitude there, its claim
to judge and deny the victor. This is the spirit of his devils, beside
whom his divinities, his fallen angels (Abdul excepted), and
even his demons, with their divinity, all seem shadowy. The discord between Milton's doctrine and his sympathies in
Paradise Lost (1667) has never escaped notice. The discord between his doctrine and his culture comes out in
Paradise Regained (1671), when he has at once to reprobate
and glorify Athens, the "mother of arts." In this afterthought to
the earlier epic the action is slight, the Enemy has lost spirit,
and the Christ is something of a pedagogue. But there is a new
charm in its even, grey desert tint, sprinkled with illuminations
of gold and luxury. In Samson Agonistes (1671) the ethical
treatment as well as the machinery is Sophoclean, and the theo-
logy not wholly Christian. But the fault of Samson is forgotten
in his suffering, which is Milton's own; and thus a cross-current
of sympathy is set up, which may not be much in keeping with
the story, but revives the somewhat exhausted interest and
heightens a few passages into a bare and inaccessible grandeur.
The essential solitude of Milton's energies is best seen in his
later style and versification. When he resumed poetry about
1658, he had nothing around him to help him as an artist in
heroic language. The most recent memories of the drama
were also the worst; the forms of Cowley and Davenant, the
would-be epic poets, were impossible. Spenser's manner was
too even and fluid as a rule for such a purpose, and his power
was of an alien kind. Thus Milton went back, doubtless full of
Greek and Latin memories, to Marlowe, Shakespeare and others
among the greater dramatists (including John Ford); and their
tragic dictum and measure are the half-hidden bases of his own.
The product, however, is unlike anything except the imitations
of itself. The incongruous elements of the Paradise Lost
and its divided sympathies are cemented, at least superficially,
by its style, perhaps the surest for dignity, character and beauty
all at once; but at the same time it has the agey, the dandyish,
pedantic over certain stretches, it is usually infallible. It is
many styles in one, and Time has laid hold on it. In these
three later poems its variety can be seen. It is perfect in personal
invocation and appeal; in the complex but unfigured rhetoric
of the speeches; in narrative of all kinds; for the inlaying work
of simile or scenery or pageant, where the quick, pure impressions
of Milton's youth and prime—possibly kept fresher by his
blindness—are felt through the sometimes conventional settings
and for soliloquy and chorique speech of a might unapproachable
since Dante. To these calls his blank verse responds at any
degree. It is the seal of Milton's artistry, as of his self-confidence.
For it greatly extends, for the epical purpose, all the known
powers and liberties of the metre; and yet, as has often been
shown, it does so not spasmodically but within fixed technical
laws or rather habits. Latterly, the underlying metrical ideals is
at times hard to detect. But Milton remains by far the surest
and greatest instrumentalist, outside the drama, on the English
unrhymed line. He would, however, have scorned to be judged
on his form alone. His soul and temper are not merely
unique in force. Their historic and representative character
ensure attention, so long as the oppositions of soul and temper
in the England of Milton's time remain, as they still are, the
deepest in the national life. He is sometimes said to harmonize
the Renaissance and the Puritan spirit; but he does not do this,
for nothing can do it. The Puritan spirit is the deep thing in
Milton; all his culture only gives immortal form to its expression.
The critics have instinctively felt that this is true; and that
is why their political and religious prepossessions have nearly
always coloured, and perhaps must colour, every judgment
passed upon him. Not otherwise can he be taken seriously,
until historians are without public passions and convictions,
or the strife between the hierarch and the Protestant is quenched
in English civilization.
Drama, 1580-1642.—We must now go back to the drama,
which lies behind Milton, and is the most individual product of
all English Literature. The nascent drama of genius
can be found in the "University wits," who flour-
ished between 1580 and 1595, and the chief of whom are Lyly,
Kyd, Peele, Greene and Marlowe. John Lyly is the first practi-
tioner in prose—of shapely comic plot and pointed talk, the
artificial but actual talk of courtly masquers who rally one
another with a bright and barren finish that is second nature.
Campaspe, Sapho and Phao, Midas, and Lyly's other comedies,
mostly written from 1580 to 1591, are frail vessels, often filled
with compliment, mythological allegory, or topical satire, and
ENGLISH LITERATURE

ELIZABETHAN AGE

having displaced the uncouth comedy, Shakespeare learned all they had to teach, and shaped the comedy of poetic, chivalrous fancy and good-tempered high spirits, which showed him the way of escape from his own rhetoric, and enabled him to perfect that art of the second period which Shakespeare afterward contained in its utmost fineness in Richard II., and its full cordiality and beauty in the other plays that consummate this period—
A Midsomer Night's Dream, The Merchant of Venice,
and one romantic tragedy, Romeo and Juliet. Behind them lay the earlier and fainter romances, with their chivalry and gaiety, The Comedy of Errors, Love's Labour's Lost and The Two Gentlemen of Verona. Throughout these years blank verse became less difficult to Shakespeare, and his plays began to abandon blank verse for special purposes, as though he had exhausted its honey. The Italian Renaissance is felt in the scenery and setting of these plays. The novella furnishes the story, which passes in a city of the Southern type, with its absolute ruler, its fantastic by-laws on which the plot nominally turns, and its mixture of real life and marvel. The personages, at first fainter of feature and symmetrically paired, soon assume sharper outline: Richard II. and Shylock, Portia and Juliet, and Juliet's Nurse and Bottom are created. The novella has left the earth and taken wings: the spirit is now that of youth and Fancy (or love brooding among the shallows) with interludes of "fierce vexation," or of tragedy, or of kindly farce. And there is a visionary element, felt in the musings of Theseus upon the nature of poetry of the dream-faculty itself; an element which is new, like the use made of fairy folklore, in the poetry of England.

Tragedy is absent, with the exception of Troilus and Cressida (1597-1599), and the comedies of wit and romance (1599-1600), in which Shakespeare perfected his style for stately, pensive or boisterous themes. Falstaff, the most popular as he is the wittiest of all imaginable comic persons, dominates, as to their prose or other world, the two parts of Henry IV., and its interlude or offshoot, The Merry Wives of Windsor. The play that celebrates Henry V. is less a drama than a pageant, diversified with mighty orations and cheerful humours, and filled with the love of Shakespeare for England. Here the most indigenous form of art invented by the English Renaissance reaches its climax. The Histories are peopled chiefly by men and warriors, of whom Hotspur, "dying in his excellence and flower," is perhaps more attractive than Henry of Agincourt. But in the "middle comedies," As You Like It, Much Ado, and Twelfth Night, the warriors are home at court, where women rule the scene and deserve to rule it; for their breath gives the note that Shakespeare's prose, the medium of their talk, has a finer grace and humour than ever before, euphuism lying well in subjection behind it.

Mankind and this world have never been so sharply sifted or so sternly consolded, since Lucretius, as in Shakespeare's tragedies. The energy which created them evades, like that of the sun, our estimate. But they were not out of relation to their time, the first few years of the reign of James, with its conspiracies, its Somerset and Overbury horrors, its enigmatic and sombre figures like Raleigh, and its revulsion from Elizabethan buoyancy. In the same decade were written the chief tragedies of Jonson, Chapman, Dekker, Marston, Tourneur; and The White Devil, and A Yorkshire Tragedy, and The Maid's Tragedy, and A Woman Killed with Kindness. But, in spite of Shakespeare's affinities with these authors at many points, Hamlet, Macbeth, Lear, Othello, with the three Roman plays (written at intervals and not together), and the two quasi-antique plays Troilus and Cressida, and Timon of Athens, form a body of drama apart from anything else in the world. They reveal a new tragic philosophy, a new poetic style, a new dramatic technique and a new world of characters. In one way above all Shakespeare stands apart; he not only appropriates the ancient pattern of heroism, of right living and right dying, revealed by North's Plutarch; others did this also; but the intellectual movement of the time, though by no means fully reflected, is reflected in his tragedies far more than elsewhere. The new and trouble ideas on man and conduct
that were penetrating the general mind, the freedom and play of vision that Montaigne above all had stimulated, here find their fruition, they would be the very worst a perfect dramatic record of a great poet's suffering and friendship.

Shakespeare's last period, that of his tragicomedies, begins about 1608 with his contributions to Pericles, Prince of Tyre. For unknown reasons he was moved, about the time of his retirement home, to record, as though in justice to the world, the happy turns by which tragic disaster is at times averted. Pericles, The Winter's Tale, Cymbeline, and The Tempest all move, after a series of crimes, calamities, or estrangements, to some final scene of enthralling beauty, where the lost reappear and love is recovered; as though after all the faint and desperate last partings—of Lear and Cordelia, of Hamlet and Horatio—which Shakespeare had imagined, he must make retrieval with the picture of young and happy creatures whose life renewes hope even in the experienced. To this end he chose the loose action and free atmosphere of the roman d'images, which had already been adapted by Beaumont and Fletcher, whom may herein have furnished Shakespeare with material for his novel and successful theatrical effects, and who certainly in turn studied his handiwork. In The Tempest this tragi-comic scheme is fitted to the tales brought by explorers of far isles, wild men, strange gods and airy music. Even if it be true that in Prospero's words the poet bids farewell to his magic, it he part later nevertheless in the composition of Henry VIII.; and not improbably also in The Two Noble Kinsmen. His share in two early pieces, The Two Noble Kinsmen (1592) and Edward III. has been urged, never established, and of many other dramas he was once idly accused.

Shakespeare's throne rests on the foundation of three equal state faculties. One is that of expression and versification; the next is the invention and presentation of human character in action; the third is the theatrical faculty. The writing of Dante may seem to us more steadily great and perfect, when we remember Shakespeare's conceits, his experiments, his haste and impatience in his long wrestle with tragic language, his not infrequent sheer infelicities. But Dante is always himself, he had not to find words for hundreds of imaginary persons. Balczac, again, may have created and exhibited as many types of mankind, but except in soul he is not a poet. Shakespeare is a supreme if not infallible poet; his verse, often of an antique simplicity or of a rich, harmonious, romantic perfection, is at other times strained and shattered with what it tries to express, and attains beauty only through discord. He is also many persons in one; in his Sonnets he is even, it may be thought, himself. But he had furthermore to study a personality not of his own fancying—with something in it of Caliban, of Dogberry and of Cleopatra—that of the audience in a playhouse. He belongs distinctly to the poets like Jonson and Massinger who are true to their art as practical dramatists, not to the poets like Chaucer than whose works chance to be in the form of plays. Shakespeare's mastery of this art is approved now by every nation. But apart from the skill that makes him eternally actable—the skill of raising, straining and relieving the suspense, and bringing it to such an ending as the theatre will tolerate—he played upon every chord in his own harriers. He frankly enlisted Jew-hated, Pope-hated and France-hated; he flattered the queen, and celebrated the Union, and stormed the house with his Fanfare over the national soldier, Henry of Agincourt and glorified England, as in Cymbeline, to the last. But in deeper ways he is the chief of playwrights. Unlike another master, Ibsen, he nearly always tells us, without emphasis, by the words and behaviour of his characters, which of them we are to love and hate, and when we are to love and when to hate those whom we can neither love nor hate wholly. Yet he is not to be bribed, yet he is not to be bribed, not to his character of something of the mean and rough justice that is found in real life. His loyalty to life, as well as to the stage, puts the crown on his felicity and his fertility, and raises him to his solitude of dramatic greatness.

Shakespeare's method could not be imparted, and despite reverberations in Beaumont, Fletcher, Webster and others he left no school. But his friend Ben Jonson, his nearest equal in vigour of brain, though not in poetical invention, was the greatest of dramatic influences down to the shutting of the theatres in 1642, and his comedies found fresh disciples even after 1660. He had "the devouring eye and the portraying hand"; he could master and order the contents of a mighty if somewhat burdensome memory into an organic drama, whether the matter lay in Roman historians or before his eyes in the London streets. He had an armoury of doctrine, drawn from the Poetics and Horace, which moulded his creative practice. This was also partly founded on a revulsion against the plays around him, with their loose build and moral improbabilities. But in spite of his photographic and constructive power, his vision is too seldom free and genial; it is that of the satirist who thinks that his office is to improve mankind by desirously representing it. And he does this by beginning with the "humour," or abstract idiosyncrasy or quality, and clothing it with accurately minute costume and gesture, so that it may pass for a man; and indeed the result is as real as many a man, and his best-tempered youthful comedy Marry, Madam, in his Humour (acted 1598), is very like life. In Jonson's monumental pieces, Volpone or the Fox (acted 1605) and The Alchemist (acted 1610), our laughter is arrested by the lowering and portentous atmosphere, or is loud and hard, startled by the enormous skill and energy displayed. Nor are the joy and relief of poetical comedy given for an instant by The Silent Woman, Bartholomew Fair (acted 1614), or The Staple of News, still less by topical plays like Cynthia's Revels, though their unfailing face and rampant fun are less charged with contempt. The erudite tragedies, Sejanus (acted 1603) and Catiline, chiefly live by passages of high forensic power. Jonson's finer elegies, eulogies and lyrics, which are many, and his fragmentary Sad Shepherd, show that he also had a free and lovely talent, often smothered by doctrine and temper; and his verse, usually strong but full of knots and snags, becomes flowing and graciously finished, his prose is of the best, especially in his Discoveries, a series of ethical essays and critical maxims; its prevalently brief and emphatic rhythms suggesting those of Hobbes, and even, though less easy and civil and various, those of Dryden. The "sons" of Jonson, Randolph and Browne, Shadwell and Wilson, were heirs rather to his riot of "humours," his learned method and satiric aim, than to his larger style, his architectural power, or his relieving grace.

As a whole, the romantic drama (so to entitle the remaining bulk of plays down to 1642) is a vast stifled jungle, full of wild life and song, with strange growths and heady perfumes, with glades of sunshine and recesses of poisoned darkness; it is not a cleared forest, where single and splendid trees grow to shapely perfection. It has "poetry enough for anything"; passionate situations, and their eloquence; and a number, doubtful small considering its mass, of living and memorable personages. Moral keeping and constructive mastery are rarer still; and too seldom through a whole drama do we see human life and hear its voices, arranged and orchestrated by the artist. But it can be truly said in defence that while structure without poetry is void (as it tended at times to be in Ben Jonson), poetry without structure is still poetry, and that the romantic drama is like nothing else in this world for variety of accent and unexpectedness of beauty. We must read it through, as Charles Lamb did, to do it justice. The diffusion of its characteristic excellences is surprising. Of its extant plays it is hardly safe to leave one unopened, if we are searchers for whatsoever is lovely or admirable. The reasons for the lack of steadfast power and artistic conscience lay partly
in the conditions of the stage. Playwrights usually wrote rapidly for bread, and sold their rights. The performances of each play were few. There was no authors' copyright, and dramas were made to be seen and heard, not to be read. There was no articulate dramatic criticism, except such as we find casually in Shakespeare, and in the practice and theory of Jonson, who was deaf or hostile to some of the chief virtues of the romantic playwrights.

The wealth of dramatic production is so great that only a broad classification is here offered. George Chapman stands apart, nearest to the greatest in high austerity of sentiment and in the gracious gravity of his romantic love-comedies. But the crude melodrama of his tragedies is void of true theatrical skill. His quasi-historical French tragedies on Bussy d'Ambois and Biron and Chabot best show his gift and also his insufferable interrupting quaintness. His versions of Homer (1598–1634), honoured alike by Jonson and by Beaumont, are the greatest verse translations of the time, and the real work of Chapman's life. Their virtues are only partially Homer's, but the general epic nobility and the majesty of single lines, which in length are the near equivalent of the hexameter, redeem the want of Homer's limpidity and continuity and the translator's imperfect knowledge of Greek. A vein of satiric ruggedness unites Jonson and Chapman with Marston and Hall, the professors of an artificial and disgusting inventive; and the same spirit of Marston's play, where his faults are the word for the command of the language of feverish and bitter sentiment. With these writers satire and contempt of the world lie at the root both of their comedy and tragedy.

It is otherwise with most of the romantic dramatists, who may be provisionally grouped as follows. (a) Thomas Dekker and Thomas Heywood are writers-of-all-work, the former profuse of tracts and pamphlets, the latter of treatises on all topics. They are both unhappy and of void of pose, and divide themselves between the artless comedy of bustling, lively, English humours and pathetic, unheroic tragedy. But Dekker has splendid poetic dreams, in Old Fortunatus (1600) and The Honest Whore, both of luxury and of tenderness; while Heywood, as in his English Traveller and Woman killed with Kindness (acted 1605), excels in pictures of actual, chivalrous English gentlemen and their generosity. The fertility and volubility of these writers, and their modest carelessness of composition, are the account of their production. With them may be named the large crowd of professional journeymen, who did not want for power, but wrote usually in partnership together, like Munday, Chettle and Drayton, or supplied, like William Rowley, underplots of rough, lively comedy or tragedy. (b) Amongst dramatists of primarily tragic and sombre temper, who in their best scenes recall the creator of Angelo, Iago and Timon, must be named Thomas Middleton (1570?–1627), John Webster, and Cyril Tourneur. Middleton has great but scattered force, and his verse has the grip and ring of the best period without a sign of the decadence. He is strong in high comedy, like The Old Law, that turns on some exquisite point of honour—"the moral sense of our ancestors"; in comedy that is merely graphic and vigorous; and in detached sketches of lowering wickedness and lust, like those in The Changeling and Women beware Women. He and Webster each created one unforgettable desperado, de Flores in The Changeling and Bosola in The Duchess of Malfi (whose "pity," when it came, was "nothing akin to him"). In Webster's other principal play, Vittoria Corombona, or the White Devil (produced about 1610), the title-character is not less magnificent in defiant crime than Goneril or Lady Macbeth. The style of Webster, for all his mechanical horrors, distils the essences of pity and terror, of wrath and scorn, and is profoundly poetical; and his point of view seems to be straight to the heart of Marston's plays, without being raucous or of moral sympathy. Cyril Tourneur, in The Revenger's Tragedy, is even more of a poet than Webster; he can find the phrase for half-insane wrath and nightmare brooding, but his chaos of impieties revolts the artistic judgment. These specialists, when all is said, are great men in their dark province. (c) The playwrights who may be broadly called romantic, of whom Beaumont, Fletcher and Massinger are the chief, while they share in the same sombre vein, have a wider range and move more in the daylight. The three just named left a very large body of drama, tragic, comic and tragi-comic, in which their several shares can partly be discerned by metrical or other tests. Beaumont (d. 1616) is nearest the prime, with his vein of Cervantesque mockery and his pure, beautiful, broken and tender verse, which is seen in his contributions to Philaster and The Maid's Tragedy. Fletcher (d. 1625) brings us closest to the actual gaieties and humours of Jacobean life; he has a profuse comic gift and the rare instinct for natural dialogue. His verse, with its flood of vehemence and expansive rhetoric, heard at its best in plays like Bondusa, cannot cheat us into the illusion that it is truly dramatic; but it overflows with beauty, like his silvery but monotonous versification with its endaccasualillas arrested at the end. In Fletcher the decadence of form and feeling palpably begins. His personages often face about at critical instants and bely their natures by sudden revulsions. Wanton and cheap characters invite not only dramatic but personal sympathy, as though the author knew no better. There is too much fine writing about a chastity which is complacent rather than instinctive, and satisfied with its formal resistances and technical escapes; so that we are far from seeing Massinger's interweaving of impersonal or political conceptions, as in The Bondman and The Roman Actor, often a triumph of arrangement; and though he wrote in the reign of Charles, he is saved by many noble qualities from being merely an artist of the decline. (d) A mass of plays, of which the authorship is unknown, uncertain or attached to a mere name, baffles classification. There are domestic tragedies, like The Many, such as Arden of Feversham; scions of the vindictive drama, like The Second Maiden's Tragedy; historic or half-historic tragedies like Nero. There are the miscellaneous histories, of which the last and one of the best is Ford's Perkin Warbeck, and melodramas of adventure such as Thomas Heywood poured forth. There are realistic citizen comedies akin to The Merry Wives, like Porter's refreshing Two Angry Women of Abingdon; there are Jonsonian comedies, vernacular farces, light intrigue- pieces like Field's and many more. Few of these, regarded as wholes, come near to perfection; few fail of some silly or scene that proves once more the unmatched diffusion of the dramatic or poetic instinct. (e) Outside the regular drama there are many varieties: academic plays, like The Return from Parnassus and Linguas, which are still mirthful; many pastoral plays or entertainments in the Italian style, like The Faithful Shepherdess; versified character-sketches, of which Day's Parliament of Bawd, with its Theoricitee grace and point, is the happiest; many masques and shows, often lyrically and scenically lovely, of which kind Jonson is the master, and Milton, in his Comus, the transfigurer; Senecan dramas made only to be read, like Daniel's and Fulke Greville's; and Latin comedies, like Ignoramus. All these species are only now being fully grouped, sifted and edited by scholars, but a number of the six or seven hundred dramas of the time remain unprinted.

There remain two writers, John Ford and James Shirley, who kept the higher tradition alive till the Puritan ordinance crushed the theatre in 1642. Ford is another of the verse-dramatists, his sinisters and mothers of evil being raucous, with poetic instinct, reflected in his verse and diction), to whom no topic, the incest of Annabella in 'Tis Pity She's a Whore, of the high crazed heroism of Calanthe in The Broken Heart, is beyond the pale, if only he can dominate it; as indeed he does, without
complicity, standing above his subject. Shirley, a fertile writer, has the general characteristic gifts, in a somewhat dilute but noble form, of the more romantic playwrights, and claims honour as the last of them.

Prose from 1550 to 1660.—With all the unevenness of poetry, the sense of style, of a standard, is everywhere; felicity is never far off. Prose also is full of genius, but it is more disfigured than verse by aberration and wasted power. A central, classic, durable, adaptable prose had been attained by Machiavelli, and by Amyot and Calvin, before 1550. In England it was only to become distinct after 1600. Vocabulary, sentence-structure, paragraph, idiom and rhythm were in a state of unchartered freedom, and the history of their crystallization is not yet written. Lack of the compensations of a company of masters, from Florio and Hooker to Milton and Clarendon, not one of whom clearly or fully anticipates the modern style, and who claim all the closer study that their special virtues have been for ever lost. They seem farther away from us than the poets around them. The verse of Shakespeare is near to us, for its tradition has persisted; his prose, the most natural and noble of his age, is far away, for its tradition has not persisted. One reason of this difference is that English prose tried to do more work than that of France and Italy; it tried the work of poetry; and it often did better that it did the normal work of prose. This overflow of the imaginative spirit gave power and elasticity to prose, but made its task of finding equilibrium the harder. Moreover, prose in England was for long a natural growth, never much affected by critical or academic canons as in France; and when it did submit to canons, the result was often merely manner. The tendencies and sinews of the language, still in its adolescent power and bewilderment, were long untried; that is, the parts of speech—noun and verb, epithet and adverb—were in freer interchange than at any period afterwards. The build, length and cadence of a complex sentence were habitually elaborate; and yet they were disorganized, so that only the ear of a master could regulate them. The law of taste and measure, perhaps through some national disability, was long unperceived.

Prose, in fact, could never be sure of doing the day's work in the right fashion. The cross-currents of pedantry in the midst of simplicity, the distrust of clear plain brevity, which was apt to be affected when it came, the imitations of foreign fashions, and the quaintness and cumbrousness of so much average writing, make it easier to classify Renaissance prose by its interests than by its styles.

The Elizabethan novel was always unhappily mannered, and is therefore dead. It fed the drama, which devoured it. The novel of Boccaccio, Bandello, Marguerite de Navarre, and others were purveyed, as remarked above, in the forgotten treasuries of Painter, Pettie, Fenton and Whetstone, and many of these works or their originals filled a shelf in the playwrights' libraries. The first of famous English novels, Lyly's Euphues (1578), and its sequel Euphues and his England, are documents of form. They are commended by a certain dapper shrewdness of observation and an almost witty priggery, not by any real beauty or deep feeling. Euphuism, of which Lyly was only the patentee, not the inventor, strikes partly back to the Spaniard Guevars, and was a model for some years to many followers like Lodge and Greene. It did not merely provide Falstaff with a pattern for mock-moral diction and vegetable similes. It genuinely helped to organize the English sentence, complex or co-ordinate, and the talk of Portia and Rosalind shows what could be made of it. By the prose translators, clauses and clusters of clauses were paired for parallel or contrast, with the best of emphatic alliteration on the corresponding parts of speech in each constituent clause. This was a useful discipline for prose in its period of groping. Sidney's incomplete and unfinished Arcadia, written 1580-1581, despite its painful forced antitheses, is sprinkled with lovely rhythms, with pleasing formal landscapes, and even with impassioned sentiment and situation, through which the writer's eager and fretted spirit shines. Both these stories, like those of Greene and Lodge, show by their somewhat affected, edited delineation of life and their courtly tone that they were meant in chief for the eyes of ladies, who were excluded alike from the stage and from its audience. Nashe's drastic and photographic tale of masculine life, Jack Wilton, or The Unfortunate Traveller, stands almost alone, for the gap of the generation between the minor pamphleteers, sometimes vivid, often full of fierce or maudlin declamation, of Nashe himself—by far the most powerful of the group—and of Greene, Dekker and Nicholas Breton. Thus the English novel was a minor passing form; the leisurely and amorous romance went on in the next century, owing largely to French influence and example.

In criticism, England may almost be counted with the minor Latin academies. Sidney, in his Defence of Poetry (1595, written about 1580), and Jonson, in his Discoveries, offer a well-inspired and lofty restatement of the current answers to the current questions, but could give no account of the actual creative writing of the time. To defend the "truth" of poetry—which was identified with all inventive writing and not only with verse—poetry was saddled with the work of science and instruction. To defend its character it was treated as a delightful but deliberate bane to good behaviour; a theory at best only true of allegory and didactic verse. The real relation of tragedy to spiritual things, which is admittedly shown, however hard its definition, in Shakespeare's plays, no critic for centuries tried to fathom. One of the chief quarrels turned on metric. A few lines that Sidney and Campion wrote on what they thought the system of Latin quantity are really musical. This theory, already raised by Ascham, made a stir at first in the group of Harvey, Sidney, Dyer and Spencer, called the "Arenopagus," an example of an attempt to copy the Italian academies; and it was revived on the brink of the reign of James. But Daniel's firm and eloquent Defence of Rhyming (1602) was not needed to persuade the poets to continue rhyming in syllabic verse. The stricter view of the nature and classification of poetry, and of the dramatic unity of action, is concisely given, partly by Jonson, partly by Bacon in his Advancement of Learning and De Augmentis; and Jonson, besides passing his famed judgments on Shakespeare and Bacon, enriched our critical vocabulary from the Roman rhetoricians. Scholastic and sensible manuals, like Webbe's Discourse of Poetry and the Art of English Poetry (1586) ascribed to Puttenham, come in the rear.

The translators count for more than the critics; the line of their great achievements from Berners' Froissart (1523-1525) to Urquhart's Rabelais (1653) is never broken long; and though their lives are often obscure, their number is really immense. The translation of Cynthis, Arcadia, and others for English prose, which the wealth of English poetry is apt to hide. The typical craftsman in this field, Philemon Holland, translated Livy, Pliny, Suetonius, Plutarch's Morals and Camden's Britannia, and his fount of English is of the ampest and purest. North, in his translation, made from Amory's classic French, of Plutarch's Lives (1597), disclosed one of the master-works of old example; Florio, in Montaigne's Essays (1603), the charter of the new freedom of mental exploration; and Shelton, in Don Quixote (1612), the chief tragicom creation of continental prose. These versions, if by no means accurate in the literal, were adequate in point of soul and style to their great originals; and the English dress of Tacitus (1591), Apuleius, Heliodorus, Comines, Celestina and many others, is so good and often so sumptuous a fabric, that no single class of prose authors, from the time of More to that of Dryden, witnesses the pre-eminence of the English translator. Their matter is given to them, and with it a certain standard of form, so that their natural strength and richness of phrase are controlled without being deadened. But the want of such control is seen in the many pamphleteers, who are the journalists of the time, and are often also playwrights or tale-tellers, divines or politicians. The writings, for instance, of the hectic, satiric and graphic Thomas Nashe, run at one extreme into fiction, and at the other into the virulent rag-sheets of the Marprelate controversy, which is of historical and social but not of artistic
note, being only a fragment of that vast mass of disputations in literature, which now seems grotesque, excitable or dull.

Richard Hooker's Laws of Ecclesiastical Polity (1594-1597), an accepted defence of the Anglican position against Geneva and Rome, is the first theological work of note in the English tongue, and the first of note since Wycliffe written by an Englishman. It is a plea for reason as one of the safe and lawful guides to the faith; but it also speaks with admirable temper and large feeling to the ceremonial and aesthetic senses. The First Book, the scaffolding of the treatise, discusses the nature of law at large; but Hooker hardly has pure speculative power, and the language had not yet learnt to move easily in abstract trains of thought. In its elaboration of clause and period, in its delicate resonant eloquence, Hooker's style is Ciceronian; but his inversions and mazes of subordinate sentence somewhat rack the genius of English. Later divines like Jeremy Taylor had to disintegrate, since they could not wield, this admirable but over-complex eloquence. The sermons (1621-1634) of Donne have the mingled strangeness and intimacy of his verse, and their subtle flame, imaginative tenacity, and hold upon the springs of awe make them unique. Though without artificial symmetry, their sentences are intricately harmonized, in strong contrast to such pellet-like clauses as those of the learned Lancelot Andrewes, who was Donne's younger contemporary and the subject of Milton's Latin epistle. With Francis Bacon (1561-1626), English philosophy began its unbroken course and took its long-delayed rank in Europe.

Bacon's prose, of which he is the first high and various master in English, was shaped and coloured by his bent as orator and pleader, by his immixture in affairs, by his speculative brain, and by his use and estimate of Latin. In his conscious craftsmanship, his intellectual confidence and curiosity, his divining faith in the future of science, and his resolve to follow the leadings of nature and experience unswervingly, in his habit of storing and using up his experience, and in his wide worldly insight, crystallized in maxim, he suggests a kind of Goethe, without the poetic hand or the capacity for love and lofty suffering. He saw all nature in a map, and wished to understand and control her by outwitting the "idola," or inherent paralyzing frailties of the human judgment. He planned but could not finish a great cycle of books in order to realize this conception. The De Augmentis Scientiarum (1623) expanded from the English Advancement of Knowledge (1605) draws the map; the Novum Organum (1620) sets out the errors of scholasticism and the methods of inductive logic; the New Atlantis sketches an ideally equipped and moralized scientific community. Bacon shared with the great minds of his century the notion that Latin would outlast any vernacular tongue, and committed his chief scientific writings to a Latin which is alive and splendid and his own, and which also disciplined and employed his English. The Essay (1597, 1612, 1625) are his lifelong, gradually accumulated diary of his opinions on human life and business. These famous compositions are often sadly mechanical. They are chippings and baskets of maxims and quotations, and of anecdotes, often classical, put together inductively, or rather by "simple enumeration" of the pros and cons. Still they are the honest notes of a practical observer and statesman, disenchanting—why not?—with mankind, concerned with cause and effect rather than with right and wrong, wanting the finer faith and insight into men and women, but full of reality, touched with melancholy, and redeeming some arid, small and pretentious counsels by many that are large and wise. Though sometimes betraying the workshop, Bacon's style, at its best, is infallibly expressive; like Milton's angels, it is "dilated or condensed according to its purposes. In youth and age alike, Bacon commanded the most opposite patterns and extremes, and escaped the current fashion, balanced in antithesis triplex, or standing solitary; the sumptuous, satisfying and broached period; the movements of exposition, oratory, pleading and narrative. The History of Henry VII. (1622), written after his fall from office, is in form as well as insight and mastery of material the one historical classic in English before Clarendon. Bacon's musical sense for the value and placing of splendid words and proper names resembles Marlowe's. But the master of mid-Renaissance prose is Shakespeare; with him it becomes the voice of finer and more impassioned spirits than Bacon's—the voice of Rosalind and Hamlet. And the eulogist of both men, Ben Jonson, must be named in their company for his senatorial weight and dignity of ethical counsel and critical maxim.

As the Stuart rule declined and fell, prose became enriched from five chief sources: from philosophy, whether formal or unmethodical; from theology and preaching and political dispute; from the poetical contemplation of death; from the observation of men and manners; and from antiquarian scholarship and history. As in France, where the first three of these kinds of writings flourished, it was a time rather of individual great writers than of any admitted pattern or common ideal of prose form, although in France this pattern was always clearer defined. The mental energy, meditative depth, and throbbing brilliant colour of the English drama passed with its decay over into prose. But Latin was still often the supplanter: the treatise of Lord Herbert of Cherbury, De Veritate, of note in the early history of Deism, and much of the writing of the ambidextrous Thomas Hobbes, are in Latin. In this way Latin disciplined English once more, though it often tempted men of genius away from English. The Lemnian (1651) with its companion books on Human Nature and Liberty, and Hobbes' complete works in Latin, in a way, rejuvenated the bitter concision of Tacitus and the clearness of a half-relief in bronze. Hobbes' speculations on the human animal, the social contract, the absolute power of the sovereign, and the subservience owed to the sovereign by the Church or "Kingdom of Darkness," enraged all parties, and left their track on the thought and controversial literature of the century. With Ben Jonson and the jurist Selden (whose English can be judged from his Table Talk), Hobbes anticipates the brief and clear sentence-structure of the next age, though not its social ease and amenity of form. But his grandeur is not that of a poet, and the poetical prose is the most distinctive kind of this period. It is eloquent above all on death and the vanity of human affairs; its solemn tenor prolongs the reflections of Claudio, of Fletcher's Philaster, or of Spenser's Despair. It is exemplified in Bacon's Essay Of Death, in the anonymous descant on the same subject wrongly once ascribed to him, in Donne's plea for suicide, in Raleigh's History of the World, in Drummond's Cyprus Grove (1623), in Jeremy Taylor's sermons and Holy Dying (1651), and in Sir Thomas Browne's Urn-Burial (1658) and Letter to a Friend. Its usual vesture is a long purple period, freely Latinized, though Browne equally commands the form of solemn and monumental epigram. He is also free from the deception that wraps round the other writers on the subject, and a holy quaintness and gusto relieve his grimations. The Religio Medici (1642), quintessentially learned, wise and splendid, is the fullest memorial of his power. Amongst modern prose writers, De Quincy is his only true rival in sensual sensibility to words.

Jeremy Taylor, the last great English casuist and schoolman, and one of the first leaders for religious tolerance (in his Liberty of Prophesying, 1647), is above all a preacher; tender, intricate, copious, inaudible in imagery and picturesque quotation. From the classics, from the East, from the animal world, from the life of men and children, his illustrations flow, without end or measure. He is a master of the lingering cadence, which soars upward and onward on its coupled clauses, as on balanced iridescent wings, and is found long after in his scholar Ruskin. Imaginative force of another kind pervades Robert Burton's Anatomy of Melancholy (1621), where the humorous medium refracts and amplifies every ray of thereserve-travelled art. The mass of Latin citation, woven, not quilted, into Burton's style, is another proof of the vitality of the cosmopolitan language. Burton and Browne owe much to the pre-critical learning of their time, which yields up such precious savours to their fancy, that we may be thankful for the delay of more precise science and
scholarship. Fancy, too, of a suddenner and witterer sort, preserves some of the ample labours of Thomas Fuller, which are scattered over the years 1631-1662; and the Lives and Compleat Angler (1653) of Izaak Walton are unspoil'd, happy or pious pieces of idyllic prose. No adequate note on the secular or sacred learning of the time can here be given; on Camden, with his vast erudition, historical, antiquarian and comparatively critical (Britannia, in Latin, 1586); or on Ussher, with his patristic and chronological learning, one of the many savants of the Anglican church. Other divines of the same camp pleased, in a plainer style than Taylor, for freedom of personal judgment and against the multiplying of "vitals in religion"; the chief were Chillingworth, one of the closest of English apologists, in his Religion of Protestants (1638), and John Hales of Eton. The Platonists, or rather Plotinists, of Cambridge, who form a curious digression in the history of modern philosophy, produced two writers, John Smith and Henry More, of an exalted and esoteric prose, more directly inspired by Greece than any other of the time; and their champion of erudition, Cutworth, in his True Intellectual System, gave some form to their doctrine.

Above the vast body of pamphlets and disputatious writing that form the historian's material stands Edward Hyde, Earl of Clarendon. Clarendon's History of the Rebellion, printed in 1672-1704, thirty years after his death. Historical writing hitherto, but for Bacon's Henry VII., had been tentative though pious. Clarendon's vast disposition upon all things, The History of the World (1664), survives by passages and poetic eloquence; gallantly written second-hand works like Knolles's History of the Turks, and the rhetorical History of the Long Parliament by May, had failed to give England rank with France and Italy. Clarendon's book, one of the greatest of memoirs and most vivid of portrait-galleries, spiritually unappreciative of the other side, but full of a subtle discrimination of character and political motive, brings its author into line with Rets and Saint-Simon, the watchers and recorders and sometimes the main monomgrams, temporary history. Clarendon's Life, above all the picture of Falkland and his friends, is a personal record of the delightful sort in which England was thus far infertile. He is the last old master of prose, using and sustaining the long, sinuous sentence, unworkable in weaker hands. He is the last, for Milton's polemic prose, hurried from the opposite camp, was written between 1643 and 1660. Whether reviling bishops or royal privilege or indissoluble monogamy, or recalling his own youth and aims; or claiming liberty for print in Areopagitica (1644); in his demonic deiances, or angelic calls to arms, or his animal eruptions of spite and hatred, Milton leaves us with a sense of the motive energies that were to be transformed into Paradise Lost and Samson. His sentences are ungainly and often inharmonious, but often irresistible; he rigidly withstood the tendencies of form, in prose as in verse, that Dryden was to represent, and thus was true to his own literary dynasty.

A special outlying position belongs to the Authorized Version (1611) of the Bible, the late fruit of the long toil that had begun with Tyndale's, and, on the side of style, with the Wycliffite translations. More scholarly than all the preceding versions which it utilized, it won its incomparable form, not so much because of the "grand style that was in the air," which would have been the worst of models, as because the style had been already tested and ennobled by generations of translators. Its effect on poetry and letters was for some time far smaller than its effect on the national life at large, but it was the greatest translation—being of a whole literature, or rather of two literatures—in an age of great translations.

Some other kinds of writing soften the transition to Restoration prose. The vast catalogue of Characters numbers hundreds of titles. Raleigh's Theophrastus and The silence of the Sea, published in 1592, are yet another Renaissance form that England shared with France. But in English hands, failing a La Bruyère—in Hall's, in Overbury's, even in those of the gay and skilful Earle (Microcosmographie, 1628)—the Character is a mere list of the attributes and oddities of a type or calling. It is to the Jonsonian drama of humours what the Pensée, or detached remark, practised by Bishop Hall and later by Butler and Halifax, is to the Essay. These works tended long to be commonplace or didactic, as the popular Resolves of Owen Feltsham shows. Cowley was the first essayist to come down from the desk and talk as to his equals in easy phrases of middle length. A time of disension was not the best for this kind of peaceful, detached writing. The letters of James Howell, the autobiography of Lord Herbert of Cherbury, and the memoirs of Kenneth Digby belong rather to the older and more mannered than to the more modern form, though Howell's English is in the plainer and quicker movement.

IV. Restoration Period

Literature from 1660 to 1700.—The Renaissance of letters in England entered on a fresh and peculiar phase in the third quarter of the century. The balance of intellectual and artistic power in Europe had completely shifted since 1580. Inspiration had died down in Italy, and its older classics were no longer a stimulus. The Spanish drama had flourished, but its influence though real was scattered and indirect. The Germanic countries were slowly emerging into literature; England they scarcely touched. But the literary empire of France began to declare itself both in Northern and Southern lands, and within half a century was assured. It was this part of the empire the English genius partly felt, though it soon asserted its own poetic and poetic and by 1720 had so reacted upon France as more than to repay the debt. Thus between 1660 and 1700 is prepared a temporary dual control of European letters. But in the age of Dryden France gave England more than it received; it gave more than it had ever given since the age of Chaucer. During Charles II.'s days Racine, Molière, La Fontaine and Bossuet ran the best of their course. Cavalier exiles like Waller, Cowley and Hobe bug had come back from the winter of their discontent in Paris, and Saint-Evremond, the typical bel esprit and critic, settled long in England. A vast body of translations from the French is recounted, including latterly the works of the Protestant refugees printed in the free Low Countries or in England. Naturally this influence told most strongly on the social forms of verse and prose—upon comedy and satire, upon criticism and maxim and epigram, while it also affected theology and thought. And this meant the renaissance once more, still unexhausted, only working less immediately and in fresh if narrower channels. Greek literature, Plato and Homer and the dramatists, became dimmer; the secondary forms of Latin poetry came to the fore, especially those of Juvenal and the satirists, and the pedestris sermo, epistolary and critical, of Horace. These had some direct influence, as Dryden's translation of them, accompanying his Virgil and Lucretius, may show. But they came commended by Boileau, their chief modernizer, and in their train was the fashion of gallant, epigrammatic and social verse. The tragedy of Corneille and Racine, developed originally from the Senecan drama, contended with the traditions of Shakespeare and Fletcher, and was reinforced by that of the corrector Jonson, in shaping the new theatre of England. The French codifiers, who were often also the distorters, of Aristotle's Poetics and Horace's Ars poética, furnished a canonical body of criticism on the epic and the drama, to which Dryden is half a disciple and half a rebel. All this implied at once a loss of the larger and fuller inspirations of poetry, a decadence in its great and primary forms, epic, lyric and tragic, and a disposition, in default of such creative power, 'to turn and take stock of past production. In England, therefore, it is the age of secondary verse and of nascent, often searching criticism. The same critical spirit was also whetted in the fields of science and speculation, which the war and the Puritan rule had not encouraged. The activities of the newly-founded Royal Society told directly upon literature, and counted powerfully in the organization of a clear, uniform prose—the "close, naked, natural way of speaking," which the historian of the Society, Sprat, cites as
part of its programme. And the style of Sprat, as of scientific masters like Newton and Ray the botanist, itself attests the change. A time of profound and peaceful and fruitful scientific labour began; the whole of Newton's *Principia* appeared in 1687; the dream of Bacon came nearer, and England was less isolated from the international work of knowledge. The spirit of method and observation and induction spread over the whole field of thought and was typified in John Locke, whose *Essay concerning Human Understanding* came out in English in 1690, and who applied the same deeply sagacious and cautious calculations to education and religion and the "conduct of the understanding." But his works, though their often mellow and dignified style has been ignorantly underrated, also show the change in philosophic writing since Hobbes. The old grandeur and pugnacity are gone; the imaginative play of science, or quasi-science, on the literature of reflection is gone; the eccentrics, the fantasists, the dreamers are gone, or only survive in curious transitional writers like Joseph Glanvil (Scepsis scientifica, 1663) or Thomas Burnet (Sacred Theory of the Earth, 1684). This change was in part a conscious and an angry change, as is clear from the attacks made in Samuel Butler's *Hudibras* (1663-1668) upon scholastic verbiage, astrology, fanatical sects and their disputes, poetic and "heroic" enthusiasm and intellectual whim.

Before the Restoration men of letters, with signal exceptions like Milton and Marvell, had been Cavalier, courtly and Anglican in their sympathies. The Civil War had scattered them away from the capital, when the language of Court was no longer spoken in *Areopagitica* of its humming and surging energies, had ceased to be, what it now again became, the natural haunt and Rialto of authors. The taste of the new king and court served to rally them. Charles II. relished *Hudibras*, used and pensioned Dryden, sat under Barrow and South and heard them with appreciation, countenanced science, visited comedies, and held his own in talk by mother-wit. Letters became the pastime, and therefore one of the more serious pursuits, of men of quality, who soon excelled in song and light scatting verse and comedy, and took their own tragedies and criticisms gravely. Poetry under such auspices became gallant and social, and also personal and partisan; and satire was soon its most vital form, with the accessories of compliment, rhymed popular argumentation and elegy. The social and conversational instinct was the master-influence in prose. It produced a subtle but fundamental change in the attitude of author to reader. Prose came nearer to the spoken speech, it became more civil and natural and persuasive, and this not least in the pulpits. The sense of ennui, or boredom, which seemed as unknown in the earlier part of the century as it is to the modern German, became strongly developed, and prose was much improved by the fear of provoking it. In all these ways the Restoration accompanied and quickened a speedier and greater change in letters than any political event in English history since the reign of Alfred, when prose itself was created.

The formal change in prose can thus be assigned to no one writer, for the good reason that it presupposes a change of spoken style lying deeper than any personal influence. If we begin with the writing that is nearest living talk—the letters of Otway or Lady Rachel Russell, or the diary of Pepys (1659-1669)—that supreme disclosure of our mother-earth—or the evidence in a state trial, or the dialogue in the more natural comedies; if we then work upwards through some of the plainer kinds of authorship, like the less slangy of L'Estrange's pamphlets, or Burnet's *History of My Own Time*, a solid Whig memoir of historical value, until we reach really admirable or lasting prose like Dryden's *Preface to his Fables* (1700), or the maxims of Halifax;—if we do this, we are aware, amid all varieties, survivals and reversions, of a strong and rapid drift towards the style that we call modern. And one sign of this movement is the revulsion against any over-saturating of language, and even the use of Latin words, for conciseness and eloquence, with the Latin element. In Barrow and Glanvill, descendants of Taylor and Browne, many Latinized words remain, which were soon expelled from style like foreign bodies from an organism. As in the mid-sixteenth and the mid-eighteenth century, the process is visible by which the Latin vocabulary and Latin complication of sentence first gathers strength, and then, though not without leaving its traces, is forced to ebb. The instinct of the best writers secured this result, and secured it for good and all. In Dryden's diction there is a nearly perfect balance and harmony of learned and native constituents, and a sensitive tact in Gallicizing; in his build of sentence there is the same balance between curtness or barrenness and complexity or unmeasured lengthiness. For ceremony and compliment he keeps a rolling period, for invective a short sharp stroke without the gloves. And he not only uses in general a sentence of moderate scale, inclining to brevity, but he finds out its harmonies; he is a seeming-careless but an absolute master of rhythm. In delusive ease he is unexcelled; and we only regret that he could not have written prose oftener instead of plays. We should thus, however, have lost their prefaces, in which the bulk and the best of Dryden's criticisms appear. From the *Essay of Dramatic Poetry* (1668) down to the *Preface to Fables* (1700) runs a series of essays: *On the Grounds of Criticism in Tragedy*, *On Heroic Plays*, *On Translated Verse*, *On Saire* and many more; which form the first connected body of criticisms in the language, and are nobly written always. Dryden's prose is literature as it stands, and yet is talk, and yet again is mysteriously better than talk. The critical writings of John Dennis are but a sincere application of the rules and canons that were now becoming conventional; but bars as though, despite Milton, though less lucid, orderly, and a very popular preacher, has little distinction; Temple, the elegant essayist, has a kind of barren gloss and fine literary manners, but very little to say. The political tracts, essays and maxims of Halifax (died 1655) are the most typically modern prose between Dryden and Swift, and are nearer than anything else to the best French writing of the same order, in their finality of epigram, their neatness and mannerliness and sharpness. The *Character of a Trimmer* and *A Daughters* are the most notable. Religious literature, Anglican and Puritan, is the chief remaining department to be named. The strong, eloquent and coloured preaching of Isaac Barrow the mathematician, who died in 1677, is a survival of the larger and older manner of the Church. In its balance of logic, learning and emotion, in its command alike of Latin splendour and native force, it deserves a recognition it has lost. Another athlete of the pulpit, Robert South, who is so often praised for his wit that his force is forgotten, continues the lineage, while Tillotson and the elder Sherlock show the tendency to the smoother and more level prose. But the revulsion against strangeness and fancy and magnificence went too far; it made for a temporary barrenness and meanness and disharmony, which had to be checked by Addison, Bolingbroke and Berkeley. From what Addison saved our daily written English, may be seen in the vigorous slangy hackwork of Roger L'Estrange, the translator and pamphleter, in the news-sheets of Dunton, and in the satires of Tom Brown. These writers were debasing the coinage with their street journalism.

Another and far nobler variety of vernacular prose is found in the Puritans. Baxter and Howe, Fox and Bunyan, had the English Bible behind them, which gave them the best of their inspiration, though the first two of them were also erudite men. Richard Baxter, an immensely learned man of the language, and one of the best of his own order for his *Saint's Everlasting Rest* (1650) and his autobiography, John Howe for his evangelical apologia *The Living Temple of God*.
(1673), Fox for his Journal and its mixture of quaintness and rapturous mysticism. John Bunyan, the least instructed of the group, marked a new point of view; those of half the nation—the half that was usually inarticulate in literature, or spoke without style or genius. His reading, consisting not only of the Bible, but of the popular allegories of giants, pilgrims and adventure, was also that of his class. The Pilgrim’s Progress, of which the first part appeared in 1678, the second in 1684, is the happy flowering sport amidst a growth of barren plants of the same tribe. The Progress is a dream, more vivid to its author than most men’s waking memories to themselves; the emblem and the thing signified are merged at every point, so that Christian’s journey is not so much an allegory with a key as a spiritual vision of this earth and our neighbours. Grace Abounding, Bunyan’s diary of his own voyage to salvation, The Holy War, an overloaded fable of the fall and recovery of mankind, and The Life and Death of Mr Badman, a novel telling of the triumphal earthly progress of a scoundrelly tradesman, are among Bunyan’s other contributions to literature. His union of spiritual intensity, sharp humorous vision, and power of simple speech consummately chosen, mark his work off alike from his own inarticulate public and from all other literary performance of his time.

The transition from the older to the newer poetry was not abrupt. Old themes and tunes were slowly disused, others previously of lesser mark rose into favour, and a few quite new were inserted, denting the acrimony of Oldham and Andrew Marvell belong to both periods. Both of them begin with fantasy and elegy, and end with satires, which indeed are rather documents than works of art. The monody of Oldham on his friend Morwent is poorly exchanged for the Saisien of the Jesus (1661), and the lovely metaphorical verses of Marvell on gardens and orchards and the spiritual love sadly give place to his Lost Instructions to a Painter (1660). In his Horatian ode, Oldham and Marvell, who applied his earlier style to national affairs, but the time proved too strong for this delightful poet. Another and a stranger satire had soon greeted the Restoration, the Hudibras. Hudibras (1663–1678) of Samuel Butler, with its companion pieces. The returned wanderers delighted in this horribly able, boisterous and fierce attack on the popular party and its religions, and its wrangles and its manners. Profoundly eccentric and irrefragably in his form, and working in the shadow of the subterfuge thenceforth called "Hudibrastic," Butler founded a small and peculiar but long-lived school of satire. The other verse of the time is largely satirical of a different tone and metre; but the earlier kind of finished and gallant lyric persisted through the reign of Charles II. The songs of John Wilmot, Earl of Rochester, are usually malicious, some times passionate; they have a music and a splendid self-abandonment such as we never meet again till thepresent. Sedley and Dosey and Ashbral Behn and Dryden are the rightful heirs of Carew and Lovelace, those infallible masters of short rhythms; and this secret also was lost for a century afterwards.

In poetry, in prose, and to some extent in drama, John Dryden, the creature of his time, is the master of its expression. He began with panegyric verse, first on Cromwell and then on Charles, which is full of fine things and false writing. The Axas Mirabilis (1667) is the chief example, celebrating the Plague, the Fire and the naval victory, in the quarrels for which Davenant’s pompous Gondibert had shown the way. The Essay on Dramatic Poesy (1668), a dialogue on the rivalries of blank verse with rhyme, and of the Elizabethan drama with the French, is perfect modern prose; and to this perfection Dryden attained at a bound, while he attained his poetical style more gradually. He practised his couplet in panegyric, in heroic tragedy, and in dramatic prologue and epilogue for twenty years consummate. Till 1680 he supported himself chiefly by his plays, which have not lived so long as their critical prefaces, already mentioned. His diction and versification came to their full power in his satires, rhymed arguments, dedications and translations. Absalom and Achitophel (part i., 1681; part ii., with Nahum Tate, 1682), as well as The Medal and Mac Grale (1682), is the chief work of the English nation at the Restoration. It is based on a once on a level with that of any ancient or modern country. The mixture of deadly good temper, Olympian unfairness, and rhetorical and metrical skill in each of these poems has never been repeated. The presentment of Achitophel, earl of Shaftesbury, in his relations with Absalom Walters and Charles the minstreling of Judah, as well as the portraits of Shimeil and Barzillai and Jotham, the eminent Whigs and Tories, and of the poets Dryden and Doge, are things whose vividness age has never discoloured. Dryden’s Protestant arguments in Rofegh Laci (1682) and his equally sincere Papistical arguings in The Hind and the Panter (1687) are just as skillful. His translations of Virgil and parts of Lucretius, of Chaucer and Boccaccio (Fables, 1700), set the seal on his command of his favourite couplet for the higher kinds of appeal and oratory. His Ode on Anne Killigrew, and his popular but coarser Alexander’s Feast, have a more lyric harmony; and his songs, inserted in his plays, reflect the change of fashion by their metrical adeptness and often thoroughly going wantoness. The epitaphs of "glorious," in its older sense of a certain conscious and warranted pride of place, not in that of boastful or pretentious, suits Dryden well. Not only did he leave a model and a point of departure for Pope, but his influence recurs in Churchill, in Gray, in Johnson and in Crabbe, where he is seen counteracting, with his large, wholesome and sincere Dryden. Pope, Wycherley, Congreve, Shakespeare and Milton until the romantic revival renewed the sense of proportion; but the same sense now demands his acknowledgment as the English poet who is nearest to their frontiers of all those who are exiled from their kingdom.

Restoration and Revolution tragedy is nearly all abortive; it is now hard to read it for pleasure. But it has noble flights, and its historic interest is high. Two of its species, the rhymed heroic play and the re-embattled blank verse, were brought to their utmost by Dryden, though in both he had many companions. The heroic tragedies were a hybrid offspring of the heroic romance and French tragedy; and though The Conquest of Granado (1665–1670) and Tyrannic Love would be very open to satire in Dryden’s own vein, they are at least generously absurd. Their intention is never ignoble, if often impossible. After a time Dryden went back to Shakespeare, after a fashion strongly set by Sir William Davenant, the connection between the older tragedy and the inaugurators of the new. They “revived” Shakespeare; they vampied him in a style that did not wholly perish till after the time of Garrick. The Tempest, Titus and Cressida, and Antony and Cleopatra were thus handled by Dryden; and the last of these, as converted by him into All for Love (1678), is loftier and stronger than any of his original plays, its blank verse renewing the ties of Restoration poetry with the great age. The heroic plays, written in one or other metre, lived long, and expired in the burlesques of Fielding and Sheridan. The Rehearsal (1671), a gracious piece of foolish partially aimed at Dryden by Buckingham and his friends, did not suffice to kill its victims. Thomas Otway and Nathaniel Lee, both of whom generally used blank verse, are the other tragic writers of note. Children instead of the extreme old age of the drama. Otway’s long-acted Venice Preserved (1683) has an almost Otway. Shakespearean skill in melodrama, a wonderful tide of passionate language, and a blunt and bold delineation of character; but Otway’s inferior style and verse could only be admired in an age like his own. Lee is far more of a poet, though less of a dramatist, and he wasted a certain talent in noise and fury.

Restoration comedy at first followed Jonson, whom it was easy to try and imitate; Shadwell and Wilson, whose works are a museum for the social antiquity, photographed the humours of the town. Dryden’s many comedies often show his more boisterous and blatant, rarely his finer qualities. Like all playwrights of the time he pillages from the French, and vulgarizes Molière without stint or shame. A truer light comedy began with Sir George Etheredge, who mirrored in
his tops the gaiety and insolence of the world he knew. The society depicted by William Wycherley, the one comic dramatist of power between Massinger and Congreve, at first seems hardly human; but his energy is skilful and faithful as well as brutal; he excels in the graphic reckless exhibition of outward humours and bustle; he scavenges in the most callous good spirits and with careful cynicism. The Plain Dealer (1677), a skilful transplanation, as well as a departure of Molière's Le Misanthrope, is his best piece: he writes in prose, and his prose is excellent, modern and life-like.

V. THE 18TH CENTURY

In the reign of Anne (1702–1714) the social changes which had commenced with the Restoration of 1660 began to make themselves definitely felt. Books began to penetrate among all classes of society. The period is consequently one of differentiation and expansion. As the practice of reading becomes more and more universal, English writers lose much of their old idiosyncrasy, intensity and obscurity. As in politics and religion, so in letters, there is a great development of nationalinity. Commercial considerations too for the first time become important. We hear relatively far less of religious controversy, of the bickering between episcopalian and non-conformists and of university squabbles. Specialization and cumbrous pedantry fall into profound disfavour. Provincial feeling exercises a diminishing sway, and literature becomes increasingly metropolitan or suburban. With the multiplication of newspapers and of periodicals, the introduction of breadth, variety and ease, it was natural enough, having regard to the place that the country played in the world's affairs, that English literature should make its début in western Europe. The strong national savour seemed to stimulate the foreign appetite, and as represented by Swift, Pope, Defoe, Young, Goldsmith, Richardson, Sterne and Ossian, if we exclude Byron and Scott, the 18th century may be deemed the cosmopolitan age, par excellence, of English Letters. The charm of 18th-century English literature, as it happens, are essentially of the rational, social and translatable kind: in intensity, exquisiteness and eccentricity of the chooser kinds it is proportionately deficient. It is pre-eminent an age of prose, and although verbal expression is seldom represented at its highest power, we shall find nearly every variety of English prose brilliantly illustrated during this period: the aristocratic style of Bolingbroke, Addison and Berkeley; the sententious style of Fielding; the erudite and logical controversy of Butler, Middletown, Smith and Bentham; the rhythmic and balanced if occasionally involved style of Johnson and his admirers; the limpid and flowing manner of Hume and Mackintosh; the light, easy and witty flow of Walpole; the divine chit-chat of Cowper; the colour of Gray and Berkeley; the organ roll of Burke; the detective journalism of Swift and Defoe; the sly familiarity of Sterne; the dance music and wax candles of Sheridan; the pompous of Gibbon; the air and riddle of Goldsmith; the peevish preciosity of Boswell,—these and other characteristics can be illustrated in 18th-century prose as probably nowhere else.

But more important to the historian of literature even than the development of qualities is the evolution of types. And in this respect the 18th century is a veritable index-museum of English prose. Essentially, no doubt, it is true that in form the prose and verse of the 18th century is mainly an extension of Dryden, just as in content it is a reflection of the increased variety of the city life which came into existence as English trade rapidly increased in all directions. But the taste of the day was rapidly changing. People began to read in vastly increasing numbers. The folio was making place on the shelves for the octavo. The bookseller began to transcend the mere tradesman. Along with newspapers the advertising of books came into fashion, and the market was regulated no longer by what learned men wanted to write, but what an increasing multitude wanted to read. The arrival of the octavo is said to have marked the enrolment of man as a reader, that of the novel the attachment of woman. Hence, among other causes, the rapid decay of lyrical verse and printed drama, of theology and epic, in ponderous tomes. The fashionable types of which the new century was to witness the full flower were accordingly the essay and the satire represented respectively by Addison and Steele, Swift and Goldsmith, and by Pope and Churchill. Pope, soon to be followed by Lady Mary Wortley Montagu, was the first Englishman who treated letter-writing as an art upon a considerable scale. Personals and memoirs prepare the way for history, in which as a department of literature English letters hitherto had been almost scandalously deficient. Similarly the new growth of fancy essay (Addison) and plain biography (Defoe) prepared the way for the English novel, the most important by far of all new literary combinations. Finally, without going into unnecessary detail, we have a significant development of topography, journalism and criticism. In the course of time, too, we shall perceive how the pressure of town life and the logic of a capital city engendered, first a fondness for landscape gardening and a somewhat artificial Arcadianism, and then, by degrees, an intensifying love of the country, of the open air, and of the rare, exotic and remote in literature.

At the outset of the new century the two chief architects of public opinion were undoubtedly John Locke and Joseph Addison. When he died at High Laver in October 1704 at the mature age of seventy-two, Locke had, perhaps, done more than any man of the previous century to prepare the way for the new era. Social duty and social responsibility were his two watchwords. The key to both was his 'imagination'. 'I speak as a man,' he wrote, 'and the doctrine of knowledge is to be regarded as independent of reason.' But the great modernist of the time was undoubtedly Joseph Addison (1672–1719). He first left the 17th century, with its stiff euphuisms, its formal obsequiousness, its ponderous scholasticism and its metaphorical antitheses, definitely behind. He did for English culture what Rambouillet did for that of France, and it is hardly an exaggeration to call the half-century before the great fame of the humoured, disguised beneath an earnest and fashionable style. Nothing could have suited Addison better than the opportunity afforded him of contributing an occasional essay or roundabout paper in praise of virtue or disparissey of stupidity and bad form to his friend's periodical. When the Spectator succeeded the *Taller* in March 1711, Addison took a more active share in shaping the character of the immortal baronet, Sir Roger, at their head) who were to make
up the "Spectator Club"; and, better even than before, he saw his way, perhaps, to reinforcing his copious friend with his own more frugal but more refined endowment. Such a privileged talent came into play at precisely the right moment to circulate through the coffee houses and to convey a large measure of French courtly ease and elegance into the more humid texture of English prose. Steele became rather disreputable in his later years, Swift was banished and went mad, but Addison became a person of the utmost importance. Indeed, the opening up of this field became almost indispensable accomplishment to the complete gentleman of that age. As an architect of opinion from 1717 to 1745 Addison may well rank with Locke.

The other side, both in life and politics, was taken by Jonathan Swift (1667-1745), who preferred to represent man on his unsocial side. He sneered at most things, but not at his own order, and he came to defend the church and the country squirearchy against the convendicte and Capel court. To understand the compleat entrenchments of the Whig chiefstays at war with France no sap proved so effectual as his pen. Literary influence was then exercised in politics mainly by pamphlets, and Swift was the greatest of pamphleteers. In the Journal to Stella he has left us a most wonderful portrait of himself in turn currying favour, spoiled, petted and humiliated by the party leaders of the Tories from 1710 to 1713. He had always been savage, and when the Hanoverians came in and he was treated as a suspect, his hate widened to embrace all mankind (Gulliver's Travels, 1726) and he bit like a mad dog. Would that he could have bitten more, for the infection of English stylists! In wit, logic, energy, pith, resourcefulness and Saxon simplicity, his prose has never been equalled. The choicest English then, it is the choicest English still. Dr John Arbuthnot (1667-1735) may be described as an understudy of Swift on the whimsical side only, whose malignity, in a nature otherwise most kindly, was circumscribed strictly by the limits of political personage. Bernard Mandeville (1670-1733), as he was in every respect, discovered a little of Swift's choice pessimism in his assault (in The Fable of the Bees of 1723) against the genteel optimism of the Characteristics of Lord Shaftesbury. Neither the matter nor the manner of the brilliant Tory chieftain Henry St John, Viscount Bolingbroke (1678-1751), appears to us now as being of the highest significance; but, although Bolingbroke's ideas were second-hand, his work has an historical importance; his dignified, balanced and decorated style was the cynosure of 18th-century statesmen. His essays on "History" and on "a Patriot King," both disturb a soil well prepared, and set up a reaction against such evil tendencies as a narrowing conception of history and a primarily factious and partisan conception of politics. It may be noted here that the fall of Bolingbroke and the Tories in 1714 precipitated the decay of the Renaissance ideal of literary patronage. The dependence of the press upon the House of Lords was already an anomaly, and the practical toleration achieved in 1695 removed another obstacle from the path of liberation. The government no longer sought to strangle the press. It could generally be tuned satisfactorily and at the worst could always be temporarily muzzled. The pensions hitherto devoted to men of genius were diverted under Walpole to spies and journalists. Yet one of the most unscrupulous of all the fabricators of intelligence, looked down upon as a hackster of the most mean and most inconsiderable literary and political importance, established his fame by a masterpiece of which literary genius had scarcely even cognizance.

The new trade of writing was represented most perfectly by Daniel Defoe (1660-1731), who represents, too, what few writers possess, a competent knowledge of work and wages, buying and selling, the squaror and roguery of the very hungry and the very mean. From reporting sensations and chronicling fails divers, Defoe worked his way almost insensibly to the Spanish tale of the old Mendoza or picaresque pattern. Robinson Crusoe was a true story expanded on these lines, and written down under stress of circumstance when its author was just upon sixty. Resembling that of Bunyan and, later, Smollett in the skilful use made of places, facts and figures, Defoe's style is the mirror of man in his shirt sleeves. What he excelled in was plain, straightforward story-telling, in understanding and appraising the curiosity of the man in the street, and in possessing just the knowledge and just the patience, and just the literary stroke that would enable him most effectually to satisfy it. He was the first and cleverest of all descriptive reporters, for he knew better than any successor how and where to thrust into those intricate details, tricks of speech and circumlocation, which tend to give an air of verisimilitude to a bald and unconvincing narrative—the funny little splutterings and nalvetés as of a plain man who is not telling a tale for effect, but striving after his own manner to give the plain unvarnished truth. Defoe contributes story, Addison character, Fielding the life-atmosphere, Richardson and Sterne the sentiment, and we have the 18th-century novel complete—the greatest literary birth of modern time. Addison, Steele, Swift and Defoe, as master-builders of prose fiction, are consequently of more importance than the "Augustan poets," as Pope and his school are sometimes called, for the most that they can be said to have done is to have perfected a more or less transient mode of poetry.

To the passion, imagination or musical quality essential to the most inspired kinds of poetry Alexander Pope (1688-1744) can lay small claim. His best work is contained in the Satires and Epistles, which are largely of the sly, insinuating, rhymed, and lucid verse so pungent and pungent phrases he has rarely if ever been surpassed. His classical fancy, his elegant turn for periphrasis and his venous sting alike made him the idol of that urban age. Voltaire in 1726 had called him the best poet living, and at his death his style was paramount throughout the civilized world. It was the apotheosis of wit, point, lucidity and technical correctness. Pope was the first Englishman to make poetry pay (apart from patronage). He was fattened by imitation to an extent which has done for poetry what the Reformation has done for the religious revival of the century. The Winter (1726) of James Thomson may be regarded as inaugurating a new era in English poetry. Lady Winchelsea, John Philips, author of Cyder, and John Dyer, whose Grongar Hill was published a few months before Winter, had pleaded by their work for a truthful and unaffected, and at the same time a romantic treatment of nature in poetry; but the ideal of artificiality and of a frigid poetic diction by which English poetry was dominated since the days of Waller and Cowley was first effectively challenged by Thomson. At the time when the Popean couplet was at the height of its vogue he deliberately put it aside in favour of the higher poetic power of blank verse. And he it was who transmitted the sentiment of natural beauty not merely to imitators such as Savage, Armstrong, Somerville, Langhorne, Mickle and Shenstone, but also to his eleget, William Collins, to Gray and to Cowper, and to his grandson, Collins, Gray.
the century to whom all credit is due as pioneers and preceptors of the romantic movement under the depressing conditions to which innovators in poetry are commonly subject. They may strike us as rather an anemic band after the great Elizabethan poets. Four of them were mentally deranged (Collins, Smart, Cowper, Blake), while Gray was a hermit, and Shenstone and Thomson the most indolent of recluse. The most adventurous, one might say the most virile of the group, was a boy who died at 22 (Swift), and last, but not least, the single men of genius, the more independent group of artists as a whole it would not perhaps be easy to discover. Catacombs and cypresses were the forms of imagery that came to them most naturally. Elegies and funeral odes were the types of expression in which they were happiest. Yet they strove in the main to follow the gleam in poetry, to reinstate imagination upon its throne, and to substitute the singing voice for the rhetorical recitative of the heroic couplet. Within two years of the death of Pope, in 1746, William Collins was content to sing (not say) what he had in him without a glimpse of wit or a flash of eloquence—and in him many have discerned the germ of that romantic éclosion which blossomed in Christobel. A more important factor in the originality of that movement was the severe critic Thomas Gray, a man of the widest curiosities of his time, in whom every attribute of the poet to which scholarship, taste and refinement are contributory may be found to the full, but in whom the strong creative energy is fatally lacking—despair which he wrote triumphantly in his Elegy, which has given to multitudes more of the exquisite pleasure of poetry than any other single piece in the English language. Shenstone and Percy, Capell, the Wartons and eventually Chatterton, continued to mine in the shafts which Gray had been the first to sink. Their laborious work of discovery resembled that which was commencing in regard to the Gothic architecture which the age of Pope had come to regard as rude and barbaric. The Augustans had come seriously to regard all pre-Drydenic poetry as grossly barbarian. One of the greatest achievements of the mid-eighteenth century was concerned with the disintegration of this obstinate delusion. The process was manifold; and it led, among other things, to a realization of the importance of the study of comparative literature. The literary grouping of the 18th century is, perhaps, the biggest thing on the whole that English art has to show; but among all its groups the most famous, and probably the most original, is that of its proto-novelistes. Richardson, Fielding, Smollett and Sterne. All nations have had their novels, which are as old at least as Greek vases. The various types have generally had collective appellations such as Milesian Tales, Alexandrian Romances, Romances of Chivalry, Acta Sanctorum, Gesta Romanorum, Cent Nouvelles Nouvelles, Romances of Roguer, Arabian Nights; but owing to the rivalry of other more popular or more respectable or at least more eclectic literary forms, they seldom managed to attain a permanent lodgment in the library. The taste in prose fiction changes, perhaps, more rapidly than that in any other kind of literature. In Britain alone several forms had passed their prime since the days of Caxton and his Arthurian prose romance of Mort d'Arthur. Such were the wearisome Arcadian romance or pastoral heroic; the new centos of tales of chivalry like the Seven Champions of Christendom; the utopian, political and philosophical romances (Oceana, The Man in the Moon); the grotesque and facetious stories of rogues retailed from the Spanish or French in dwarf volumes; the prolix romance of modernized classic heroism (The Grand Cyrus); the religious allegory (Bunyan's Life and Death of Mr Badman); the novels of outspoken French or Italian gallantry, represented by Apha Behn; the imaginary voyages so notably adapted to satire by Defoe and St. John, but not least, the minutely prosaic chroniclenovels of Daniel Defoe. The prospect of the novel was changing rapidly. The development of the individual and of a large well-to-do urban middle class, which was rapidly multiplying its area of leisure, involved a curious and self-conscious society, hungry for pleasure and new sensations, anxious to be told about themselves, willing in some cases even to learn civilization from their better. The diapason into which the drama had fallen since Jeremy Collier's attack on it directed this society by an almost inevitable course into the flowery paths of fiction. The novel, it is true, had a reputation which was for the time being almost as unsavoury as that of the drama, but the novel was not a confirmed ill-doer, and it only needed a touch of genius to create for it a vast congregation of enthusiastic votaries. In the hands of Fielding and Smollett already found the methods and subjects of the modern novel. The De Coverley papers in the Spectator, in fact, want nothing but a love-thread to convert them into a serial novel of a high order. The supreme importance of the sentimental interest had already been discovered and exemplified to good purpose in France by Madame de la Fayette, the Marquise de Tencin, Marivaux and the Abbé Prevost. Samuel Richardson (1689-1761), therefore, when he produced the first two modern novels of European fame in Pamela (1740) and Clarissa (1748), inherited far more than he invented. There had been Richardsonians before Richardson. Clarissa is nevertheless a pioneer work, and we have it on the high authority of M. Jusserand that the English have contributed more than any other people to the formation of the contemporary novel. Of the long-winded, typical and rather chaotic English novel of love analysis and moral sentiment (as opposed to the romance of adventure) Richardson is the first. His successful charactere. The novel in England gained prodigiously by the shock of opposition between the ideals of Richardson and Henry Fielding (1707-1754), his rival and parodist. Fielding's brutal toleration is a fine corrective to the slightly rancid morality of Richardson, with its frank insistence upon the cash-value of chastity and virtue. Fielding is, to be brief, the succinct antithesis of Richardson, and represents the opposite pole of English character. He is the Cavalier, Richardson the Roundhead; he is the gentleman, Richardson the tradesman; he represents church and county, Richardson chapel and borough. Richardson had much of the patient insight and intensity of genius, but he lacked the humour and literary accomplishment which Fielding had in rich abundance. Fielding combined breadth and keenness, classical culture and a delicate Gallic irony to an extent rare among English writers. He lacked the delicate intuition of Richardson in the analysis of women, nor could he compass the broad farcical humour of Smollett or the sombre colouring by which Smollett produces at times such poignant effects of contrast. There was no poetry in Fielding; but there was practically every other ingredient of a great prose writer—taut, culture, order, vividness, humour, penetrating irony and vivid, pervading common sense, and it is Fielding's chef-d'œuvre Tom Jones (1749) that we must regard if not as the fundament at least as the head of the corner in English prose fiction. Before Tom Jones appeared, the success of the novel had drawn a new competitor into the field in Tobias Smollett, the descendant of a good western lowland family who had knocked about the world and seen more of its hurly-burly than Fielding himself. In Roderick Random (1748) Smollett represents a rougher and more uncivilized world even than that depicted in Joseph Andrews. The savagery and horse-play peculiar to these two novelists derives in part from the rogue romance of Spain (as then recently revived by Lesage), and has a counterpart to some extent in the graphic art of Hogarth and Rowlandson; yet one cannot altogether ignore an element of exaggeration which has greatly injured both these writers in the estimation (and still more in the affection) of posterity. The genius which struggles through novels such as Roderick Random and Ferdinand Count Fathom was nearly submerged under the hard conditions of a general writer during the third quarter of the 18th century, and it spent the volumes of Smollett's powers of recuperation that he survived to write two such masterpieces of sardonic and humorous observation as his Travels and Humphry Clinker. The fourth proto-master of the English novel was the anti-
good deal to Don Quixote and the French novelists, Fielding and Smollett were essentially observers of life in the quick. Sterne brought a far-fetched style, a bookish apparatus and a deliberate eccentricity into fiction. Tristram Shandy, produced successively in nine small volumes between 1760 and 1764, is the pretended history of a personage who is not born (before the fourth volume) and hardly ever appears, carried on in an eccentric rigmarole of old and new, original and borrowed humour, arranged in a style well known to students of the later Voltairean humorists as farcesie. Far more than Molière, Sterne took his literary bien wherever he found it. But he invented a kind of tremolo style of his own, with the aid of which, in conjunction with the most unblushingly indecent innuendoes, and with a congenious genius for humorous portraiture, trembling upon the verge of the pathetic, he succeeded in winning a new domain for the art of fiction. These four great writers then, Richardson, Fielding, Smollett and Sterne—all of them great pessimists in comparison with the benignant philosophers of a later fiction—first thoroughly fertilized this important field. Richardson obtained a European fame during his lifetime. Sterne, as a pioneer impressionist, gave all subsequent stylists a new handle. Fielding and Smollett grasped the new instrument more vigorously, and fashioned with it models which, after serving as patterns to Schiller, Mozart, Cooper, Alcott, Dickens, Le Fanu, Stevenson, Meredith, Weyman and other romantics of the 19th century, have still retained a fair measure of their original popularity unimpaired. Apart from the novelists, the middle period of the 18th century is strong in prose writers: these include Dr Johnson, Oliver Goldsmith, Lord Chesterfield and Horace Walpole. The last three were all influenced by the sovereign lucidity of the best French style of the day. Chesterfield and Walpole were both writers of aristocratic experience and of European knowledge and sentiment. Johnson alone was a distinctly English thinker and stylist. His knowledge of the world, outside England, was derived from books, he was a good deal of a scholar, an earnest moralist, and something of a divine; his style, at any rate, reaches back to Taylor, Barrow and South, and has a good deal of the complex structure, the cadence, and the balance of English and Latinistic words proper to the 17th century, though the later influence of Addison and Bolingbroke is also apparent; Johnson himself was fond of the essay, the satire in verse, and the moral tale (Rasselas); but he lacked the creative imagination indispensable for such work and excelled chiefly as biographer and critic. For a critic even, it must be admitted that he was singly deficient in original ideas. He upholds authority. He judges by what he regards as the accepted rules, derived by Dryden, Rapin, Bolleau, Le Bossu, Kyrke, Davenant, Pope and such "estimable critics" from the ancients, whose decisions on such matters he regards as paramount. He tries to carry out a systematic, motivated criticism; but he asserts rather than persuades or convinces. We go to his critical works (Lines of the Poets and Essay on Shakespeare) not for their conclusions, but for their shrewd comments on life, and for an application to literary problems of a caustic common sense. Johnson's character and conversation, his knowledge and manners, are more remarkable than his ideas or his writings admirable though the best of these were; the exceptional traits which met in his person and made that age regard him as a nonpareil have found in James Boswell a delineator unrivalled in patience, dexterity and dramatic insight. The result has been a portrait of a man of letters more alive at the present time than that which any other age or nation has bequeathed to us. In most of his ideas Johnson was a generation behind the typical academic critics of his date, Joseph and Thomas Warton, who championed against his authority what the doctor regarded as the finicky notions of Gray. Both of the Wartons were enthusiastic for Spenser and the older poetry; they were saturated with Milton whom they placed far above the correct Mr Pope, they wrote sonnets (thereby provoking Johnson's ire) and attempted to revive medieval and Celtic lore in every direction. Johnson's one attempt at a novel or tale was Rasselas, a long "Rambler" essay upon the vanity of human hope and ambition, something after the manner of the Oriental tales of which Voltaire had caught the idea from Swift and Montesquieu; but Rasselas is quite unenlivened by humour, personality or any other charm. This one quality that Johnson so completely lacked was possessed in its fullest perfection by Oliver Goldsmith, whose style is the supreme expression of 18th-century clearness, simplicity and easy graceful fluency. Much of Goldsmith's material, whether as playwright, story writer or essayist, is trite and commonplace—his material worked up by any other hand would be worthless. But, whenever Goldsmith writes about human life, he seems to pay it a compliment, a relief of fun and good fellowship accompanies his slightest description, his playful and delicate touch could transform every thought that he handled into something radiant with sunlight and fragrant with the perfume of youth. Goldsmith's plots are Irish, his critical theories are French with a light top dressing of Johnson and Reynolds or Burke, while his prose style is an idealization of Addison. His versatility was great, and, in this and in other respects, he and Johnson are constantly reminding us that they were hardened professionals, writing against time for money. Moreover, the best preserved work of this period, from 1740 to 1780, was done under very different conditions. The increase of travel, of intercourse between the nobility of Europe, and of a sense of solidarity, self-consciousness, leisure and connoisseurship among that section of English society known as the governing class, or, since Disraeli, as "the Venetian oligarchy," could hardly fail to produce an increasing crop of those elaborate collections of letters and memoirs which had already attained their apogee in France with Mme de Sévigné and the duc de Saint-Simon. England was not to remain far behind, for in 1718 commenced the Letters of Lady Mary Wortley Montagu; ten years more saw the commencement of Lord Hervey's Memoirs of the Reign of George II.; and Lord Chesterfield and Lord Orford (better known as Horace Walpole) both began their inimitable series of Letters about 1740. These writings, none of them written ostensibly for the press, serve to show the enormous strides that English prose was making as a medium of vivacious description. The letters are all the recreation of extensive knowledge and cosmopolitan acquirements; they are not strong on the poetic or imaginative side of things, but they have an intense appreciation of the actual and mundane side of fallible humanity. Lord Chesterfield's Letters to his son and to his godson are far more, for they introduce a Ciceronian polish and a Gallic irony and wit into the hitherto uncultivated literary life of the English prose drawer. Chesterfield, whose theme is manners and social amenities, deliberately fields a form of expression appropriate to his text—the perfection of tact, neatness, good order and savoir faire. After his grandfather, the marquis of Halifax, Lord Chesterfield, the synonym in the vulgar world for a heartless exquisite, is in reality the first fine gentleman and epicurean in the best sense in English polite literature. Both Chesterfield and Walpole were conspicuous as racconteurs in an age of witty talkers, of whose talk R. B. Sheridan, in The School for Scandal (1777), served up to them, we might find, fine dresses, fine jokes, fine plate, fine equipages glitter and sparkle; never was such a brilliant, smirking Vanity Fair as that through which he leads us." Yet, in some ways, he was a corrective to the self-complacency of his generation, a vast dilettante, lover of "Gothic," of curios and antiques, of costly printing, of old illuminations and stained glass. In his short miracle-novel,
called *The Castle of Otranto*, he set a fashion for mystery and terror in fiction, for medieval legend, diablerie, mystery, horror, antique furniture and Gothic jargon, which led directly by the route of Anne Radcliffe, Maturin, *Variaz.* St Leon and *Frankenstein*, to *Queenoko Hall*, to *Waverley* and even to Hugo and *Poe.*

Meanwhile the area of the Memoir was widening rapidly in the hands of Fanny, the sly daughter of the wordy-wise and fashionable musician, Dr Burney, author of a novel ("Edulis") most satirical and factice, written ere she was well out of her teens; not too kind a satirist of her former patroness, Mrs Thrale (afterwards Fizzi), the last tinsel of the new group of scribbling sibyls, blue stockings, lady dietetics, Mrs De la Crusc and Mrs Delica Cru. Both, as particular types of the purveyors of Johnsoniana, were surpassed by the inimitable James Boswell, first and most fatuous of all interviewers, in brief a biographical genius, with a new recipe, distinct from Sterne's, for disclosing personality, and a deliberate, artificial method of revealing himself to us, as it were, unawares.

From all these and many other experiments, a far more flexible prose was developing in England, adapted for those critical reviews, magazines and journals which were multiplying rapidly to exploit the new masculine interest, apart from the schools, in history, topography, natural philosophy and the picturesque, just as circulating libraries were springing up to exploit the new feminine passion for fiction, which together with memoirs and fashionable poetry contributed to give the book-sellers bigger and bigger ideas.

It is surprising how many types of literary productions with which we are now familiar were first moulded into definite and classical form during the Johnsonian period. In addition to the novel one need only mention the economic treatise, as exemplified for the first time in the admirable symmetry of *The Wealth of Nations*, the diary of a faithful observer of nature such as Gilbert White, the *Fifteen Discourses* (1769-1791) in which Sir Joshua Reynolds endeavours for the first time to expound for England a philosophy of Art, the historico-philosophical tableau as exemplified by Robertson and Gibbon, the light political parody of which the poetry of The Rollock and Ani-Jocin afford so many excellent models; and, going to the other extreme, the ponderous archaeological or topographical monograph, as exemplified in Stuart and Revett's *Antiquities of Athens*, in Robert Wood's *Colonial Ruins of Palmyra* (1753), or the monumental *History of Leicestershire* by John Nichols. Such works as this last might well seem the outcome of Horace Walpole's maxim: *In this scrabbling age 'let those who can't write, glean.'*

In short, the literary landscape in Johnson's day was slowly but surely assuming the general outlines to which we are all accustomed. The literary conditions of the period dated from the time of Pope in their main features, and it is quite possible that they were more considerably modified in Johnson's own lifetime than they have been since. The booksellers, or, as they would now be called, publishers, were steadily superseding the old ties of patronage, and basing their relations on figures and upon a commercial footing. A stage in their progress is marked by the success of Johnson's friend and Hume's correspondent, William Strahan, who kept a coach, "a credit to literature." The evolution of a normal status for the author was aided by the definition of copyright and gradual extinction of piracy.

Histories of their own time by Clarendon and Burnet have been in much request from their own day to this, and the first, at least, is a fine monument of English prose; Bolingbroke, again, in 1735, dwelt memorably upon the ethical, political and philosophical value of history. But it was not until the third quarter of the 18th century that English literature freed itself from the imputation of lagging hopelessly behind France, Italy and Germany in the serious work of historical reconstruction. Hume published the first volume of his *History of England* in 1754. Robertson's *History of Scotland* saw the light in 1759 and his *Charles V.* in 1765; Gibbon's *Decline and Fall of the Roman Empire* came in 1776. Hume was, perhaps, the first modernist in history; he attempted to give his work a modern interest and, Scot though he was, a modern style—"it could not fail, as he knew, to derive piquancy from its derision of the Whiggish assumption which regarded 1688 as a political millennium. Wm. Robertson, instead of such metaphysical speculations, was the first to give to his narratives the periphrases of the pulpits to historical generalization. The gifts of commonplace by which he had learned as Moderator of the General Assembly he brought to bear upon his historical studies, and a language so unfamiliar to his lips as academic English he wrote with so much the more care that the greatest connoisseurs of the day were enthusiastic about "Robertson's wonderful style." Even more portentous in its superhuman dignity was the style of Edward Gibbon, who, combined with the unspiritual optimism of Hume, made the most concentrated devotion to his subject, an industry more monumental, a greater co-ordinative vigour, and a malice which, even in the 18th century, rendered him the least credulous man of his age. Of all histories, therefore, based upon the transmitted evidence of other ages rather than on the personal observation of the writer's own, Gibbon's *Decline and Fall* has hitherto maintained its reputation best. Hume, even before he was superseded, fell a prey to continuations and abridgements, while Robertson was reconstrasted systematically by the ornate pages of W. H. Prescott.

The increasing transparency of texture in the working English prose during this period is shown in the writings of theologians such as Butler and Paley, and of thinkers such as Berkeley and Hume, who, by prolonging and extending Berkeley's contention that matter was an abstraction, had shown that mind would have to be considered an abstraction too, thereby signalling a school of reaction to common sense or "external reality" represented by Thomas Reid, and with modifications by David Hartley, Abraham Tucker and others. Butler and Paley are merely two of the biggest and most characteristic apologists of that day, both great stylists, though it must be allowed that their very lucidity and good sense excites almost more doubt than it stills, and both very successful in repelling the enemy in controversy, though their very success accentuates the faults of that unspiritual age in which churchmen were so far more concerned about the title deeds than about the living portion of the church's estate. Free thought was already beginning to sap their defences in various directions, and in Tom Paine, Priestley, Price, Godwin and Mackintosh they found more formidable adversaries than in the earlier deists. The greatest champion, however, of continuity and conservation both in church and state, against the new schools of latitudinarians and radicals, the great eulogist of the unwritten constitution, and the most perfect master of emotional prose, in this period, prose in which the harmony of sense and sound is attained to an extent hardly ever seen outside supreme poetry, was Edmund Burke, one of the most commanding intellects in the whole range of political letters—a striking contrast in this respect to Junius, whose mechanical and journalistic talent for invective has a quite ephemeral value.

From 1660 to 1760 the English mind was still much occupied in shaking off the last traces of feudality. The crown, the parliament, the old penal code were left as it is true: but the old tenures and gild-brotherhoods, the old social habits, miracles, arts, faith, religion and letters were irrevocably gone. The attempt of the young Chevalier in 1745 was a complete anarchomach, and no sooner was this generally felt to be so than men began to regret that it should so be. Men began to describe as "grand" and "picturesque" scenery hitherto summarized as "barren mountains covered in mist"; while Voltaire and Pope were at their height, the world began to realize that the Augustan age, in its zeal for rationality, civism and trim parterres, had neglected the wild freshness of an age when literature was a wild flower that grew on the common. Rousseau laid the axe to the root of this over-sophistication of life; Goldsmith, half understanding, echoed some of his ideas in "The Deseret Village." Back from books to men was now the prescription—from the crowded town to the spacious country. From plains and valleys to peaks and pinewoods. From cities, where men were rich and corrupt,
to the earlier and more primitive moods of earth. The breath had scarcely left the body of the Grand Monarque before an intrigue was set on foot to dispute the provisions of his will. So with the critical testament of Pope. Within a few years of his death we find Gray, Warton, Hume and conscious of the highest kind of poetic excellence, and exalting imagination and fancy into a sphere far above the Augustan qualities of correct taste and good judgment. De-centralization and revolt were the new watchwords in literature. We must eschew France and Italy and go rather to Ireland or the Hebrides for fresh poetic emotions: we must shun academies and classic coffee-houses and go into the street-corners or the hedge-lanes in search of Volkspoesie. An old muniment chest with a yellow paper roll and a distincttive of the new spirit of the picture. How else are we to explain the enthusiasm that welcomed the sham Ossianic poems of James Macpherson in 1760; Percy's patched-up ballads of 1765 (Reliques of Ancient Poetry); the new enthusiasm for Chaucer; the "black letter" school of Ritson, Tyrwhitt, George Ellis, Steevens, Ireland and Malone; above all, the spurious 15th-century poems poured forth in 1768-1769 in imitation of a style which not quite seventeen years of age? Chatterton's precocious fantasy cast a wonderful spell upon the imaginative imitation of other times. It does not prepare us for the change that was coming over the poetic spirit of the last two decades of the century, but it does at least help us to explain it. The great masters of verse in Britain during this period were the three very disparate figures of William Cowper, William Blake and Robert Burns. Cowper was not a poet of vivid and rapturous visions. There is always something of the rusticaizing city-scholar about his humour. The unguided impulse and imaginative passion of the great masters of poetry were not his to claim. His motives to express himself in verse came very largely from the outside. The greater part, nearly all his best poetry is of the occasional order. To touch and retouch, he says, in one of his letters—among the most delightful in English—is the secret of almost all good writing, especially verse. Whatever is short should be nervous, masculine and compact. In all the arts that raise the best occasional poetry to the level of greatness Cowper is supreme. In phrase-moulding, verbal gymnastic and prosodical marquetry he has scarcely a rival, and the fruits of his poetic industry are enshrined in the liliger of a most delicate fancy and a highly cultivated intelligence, purified and thrice refined in the fire of mental affliction. His work expresses the rapid civilization of his time, its human and animal sensitiveness to natural beauty, home comfort, the claims of animals and the charms of light literature. In many of his short poems, such as "The Royal George," artistic simplicity is indistinguishable from the stern reticence of genius. William Blake had no immediate literary descendants, for he worked alone, and Lamb was practically alone in recognizing what he wrote as poetry. But he was by far the most original of the reactionaries who preceded the Romantic Revival, and he caught far more of the Elizabethan air in his lyric verse than any one else before Coleridge. The Songs of Innocence and Songs of Experience, in 1789 and 1794, sing themselves, and have a bird-like spontaneity that has been the despair of all song-writers from that day to this. After 1800 he winged his flight farther and farther into strange and unknown regions. In the finest of these earlier lyrics, which owe so little to his contemporaries, the ripple of the stream of romance that began to push forth in 1798 is distinctly heard. But the first poetic genius of the century was unmistakably Robert Burns. In song and satire alike Burns is racy, in the highest degree, of the poets of North Britain, who since Robert Sempill, Willy Hamilton of Gilbertfield, douce Allan Ramsay, the Edinburgh periwig-maker and miscellaneous, and Robert Fergusson, "the writer-chiel, a deathless name," had kept alive the old native poetic tradition, had provided the strolling fiddlers with merry and wanton staves, and had perpetuated the daintiest shreds of national music, the broadest col- loquialisms, and the warmest hues of patriotic or local sentiment. Burns immortalizes these old staves by means of his keener vision, his more fiery spirit, his stronger passion and his richer volume of sound. Burns's fate was a pathetic one. Brief, it is true, his career, but a lifetime of toil and toil, of semi-competence, of unutterable desire to become part of its loveliness, to partake in a mystical sense of the loneliness of the mountain, the sound of falling water, the upper horizon of the clouds and the wind. To the growing multitude of educated people who were being pent in huge cities these ideas were far sweeter than the formalities of the old pastoral. Wordsworth's great discovery, perhaps, was that popular poetry need not be imaginative, artificial or condescending,
ENGLISH LITERATURE

but that a simple story truthfully told of the passion, affliction or devotion of simple folk, and appealing to the primal emotion, is worthy of the highest effort of the poetic artist, and—may achieve a poetic value far in advance of conventional descriptions of strikingly grouped incidents picturesquely magnified or rhetorically exaggerated. But Wordsworth's theories might have ended very differently had the youth, who had so freely given their impressions by the complementary genius of Coleridge.

Coleridge at his best was inspired by the supreme poetic gifts of passion, imagination, simplicity and mystery, combining form and colour, sound and sense, novelty and antiquity, realism and romanticism, scholarly ode and popular ballad. His three fragmentary poems The Rime of the Ancient Mariner, Christabel and Kubla Khan are the three spells and touchstones, constituting what is often regarded by the best judges as the high-standard of modern English poetry. Their subtleties and beauties irradiated the homelier artistic conceptions of Wordsworth, and the effect on him was permanent. Coleridge's inspiration, on the other hand, was irrecoverable; a physical element was due, no doubt, to the first exaltation indirectly due to the opium habit, but the moral influence was contributed by the Wordsworths. The steady will of the Daleam secundum was the prevailing poetical force in Coleridge's life from simpliciter wandering; his lofty and unavailing self-confidence inspired his friend with a similar energy. Away from Wordsworth after 1798, Coleridge lost himself in visions of work that always remained to be "transcribed," by one who had every poetic gift—save the rudimentary will for sustained and concentrated effort.

Coleridge's more delicate sensibility to the older notes of that more musical era in English poetry which preceded the age of Lamb. By dryden and Pope was due in no small measure to the luminous yet subtle intimations of his friend Charles Lamb. Lamb's appreciation of the imaginative beauty inhaled in old English literature amounted to positive genius, and the persistence with which he brought his perception of the supreme importance of imagination and music in poetry to bear upon some of the finest creative minds of 1800, in talk, letters, selections and essays, brought about a gradual revolution in the aesthetic morality of the day. He paid little heed to the old rhetoric and the art poétique of classical comparison. His aim was rather to discover the mystery, the folk-seed and the world-element, latent in so much of the finer ancient poetry and implicit in so much of the new. The Essays of Elia (1820-1825) are the pinnacle of Lamb's vessel of exploration. Lamb and his great rival, William Hazlitt, both maintained that criticism was not so much an affair of learning, or an exercise of comparative literature, as a responsible and sympathetic judgment on the works of men, and in itself. Hazlitt became one of the master essayists, a fine critical analyst and declaimer, denouncing all insipidity and affectation, stirring the soul with metaphor, soaping easily and acquiring a momentum in his prose which often approximates to the impassioned utterance of Burke. Like Lamb, he wanted to measure his contemporaries by the Elizabethans, or still older masters, and he was deeply impressed by Lyrical Ballads. The new critics gradually found responsible auxiliaries, notably Leigh Hunt, De Quincey and Wilson of Blackwood's.

Leigh Hunt. De Quincey.

Leigh Hunt, not very important in himself, was a cause of great authorship in others. He increased both the depth and area of modern literary sensibility. The world of books was to him an enchanted forest, in which every leaf had its own secret. He was the most catholic of critics, but he knew what was poor—at least in other people. As an essayist and a feminine disputable one, he lived in an imaginary, and fancy and literary illustration, but far inferior in decisive insight or penetrative masculine wit. The Miltonic quality of impassioned pyramidal prose is best seen in Thomas De Quincey, of all the essayists of this age, or any age, the most diffuse, unequal and irreducible to rule, and which yet at times trembles upon the brink of a rhythmical sonority which seems almost to rival that of the greatest poetry. Leigh Hunt supplies a valuable link between Lamb, the sole external moderator of the Lake school, Byron, Shelley, and the junior branch of imaginative Aesthetic, represented by Keats.

John Keats (1795-1821), three years younger than Shelley, was the greatest poet of his time, and would probably have surpassed all, but for his collapse of health at twenty-five. His vocation was as unmistakable as a Chatterton, with the youth and the genius that often had points of likeness. The two contemporary conceptions of him as a fatuous Cockney Bunthorne or as "a tadpole of the lakes" were equally erroneous. But Keats was in a sense the first of the virtuoso or aesthetic school (caricatured later by the formular of "Art for Art's sake"); artistic beauty was to him a kind of religion, his expression was more technical, less personal than that of his contemporaries, he was a conscious "romantic," and he travelled in the realms of gold with less impediments than any of his fellows. Byron had always himself to talk about, Wordsworth saw the universe too much through the medium of his own self-importance, Coleridge was a metaphysician, Shelley hymned Intellectual Beauty; Keats treats of his subject, "A Greek Urn," "A Nightingale," the season of "Autumn," in such a way that our thought centres not upon the poet but upon the enchantment of that which he sings. In his three odes of love, "Ode on a Grecian Urn," "The Eve of St Agnes" and "La Belle Dame Sans Merci," even more than in his Odes, Keats is the forerunner of Tenaysow, the greatest of the word-painters. But apart from his perfection of loveliness, he has a natural magic and a glow of humanity surpassing that of any other known poet. His poetry, immature as it was, gave a new beauty to the language. His loss was the greatest English Literature has sustained.

Before Tennyson, Rossetti and Morris, Keats's best disciples in the aesthetic school were Thomas Lovell Beddoes, George Dailey and Thomas Hood, the failure of whose "Midsummer Fairies" and "Fair Inez" drove him into that almost mortal vein of verbal humour which threw up here and there a masterpiece such as "The Song of a Shirt." The master virtuoso of English poetry in another department (the classical) during this and the following age was Walter Savage Landor, who threw off a few fragments of verse worthy of the Greek Anthology, but in his Dialogues or "Imaginary Conversations" evolved a kind of violent monologizing upon the commonplace which descends into the most dismal caverns of egotism. Carlyle furiously questioned his competence. Mr Shaw allows his classical amateurship and respectable strenuousness of character, but denounces his work, with a substratum of truth, as that of a "blathering, unreadable pedant."

Among those, however, who found early nutriment in Landor's Mona Lisa (1798) and the Lockean act of imagination, was the most poetic of our poets. P. B. Shelley was a spirit apart, who fits into no group, the associate of Byron, but spiritually as remote from him as possible, hated by the rationalists of his age, and regarded by the poets with more pity than jealousy. He wrote only for poets, and had no public during his lifetime among general readers, by whom, however, he is now regarded as the poet par excellence. In his conduct it must be admitted that he was in a sense, like Coleridge, irresponsible, but on the other hand his poetic energy was irresistible and all his work is technically of the highest order of excellence. In ideal beauties it is supreme; its great lack is its want of humanity; in this he is the opposite of Wordsworth who reads human nature into everything. Shelley, on the other hand, dehumanises things and makes them unearthly. He hangs a poem, like a cobweb or a silver cloud, on a horn of the crescent moon, and leaves it to its fate. He was in a sense, like Coleridge, responsible, but on the other hand his poetic energy was irresistible and all his work is technically less sensuous than those in Keats; having obtained such an idea he passed it again and again through the prism of his mind, in talk, letters, prefaces, poems. The deep sense of the mystery of words and their lightest variations in the skem of poetry, half forgotten since Milton's time, had been recovered in a great measure by Coleridge and Wordsworth since 1798; Lamb, too, and Hazlitt, and, perhaps, Hogg were in the secret, while Keats...
had its open sesame on his lips ere he died. The union of poetic emotion with verbal music of the greatest perfection was the aim of all, but none of these masters made words breathe and sing with quite the same spontaneous ease and fervour that Shelley attained in some of the lyrics written between two years and a half, such as "The Cloud," "The Skylark," the "Ode of the West Wind," "The Sensitive Plant," the "Indian Serenade."

The path of the new romantic school had been thoroughly prepared during the age of Gray, Cowper and Burns, and it won its triumphs with little resistance and no serious convictions. The opposition was noisy, but its representative character has been exaggerated. In the meantime, however, the old-fashioned school and the Popean couplet, the Johnsonian dignity of reflection and the Goldsmithian ideal of generalized description, were well maintained by George Crabbe (1754-1832), "though Nature’s sternest painter yet the best," a worsted-stocking Pope and austere delineator of village misdoing and penurious age, and Samuel Rogers (1764-1835), the banker poet, liberal in sentiment, extreme Tory in form, and diletante delineator of Italy to the music of the heroic couplet. Robert Southey, Thomas Campbell and Thomas Moore were a dozen years younger and divided their allegiance between two schools. In the main, however, they were still poeticians of the orthodox old pattern, though all wrote a few songs of exceptional merit, and Campbell especially by defying the old anathemas.

The great champion of the Augustan masters was himself the architect of revolution. First the idol and then the outcast of respectable society, Lord Byron sought relief in new cadences and new themes for his poetic talent. He was, however, essentially a history painter or a satirist in verse. He had none of the sensitive aesthetic taste of a Keats, none of the spiritual ardour of a Shelley, or of the elemental beauty or artistry of Wordsworth or Coleridge. He manages the pen (said Scott) with the careless and negligent ease of a man of quality. The "Lake Poets" sought to create an impression deep, calm and profound, Byron to start a theme which should enable him to pose, travel, astonish, bewilder and confound as lover of daring, freedom, passion and revolt. For the sublter symphonic music—that music of the spheres to which the ears of poets alone are attuned—Byron had an imperfect sympathy. The delicate ear is often revolted in his poetry by the vices of impromptu work. He steadfastly refused to polish, to file or to furbish—the damning, inevitable sign of a man born to wear a golden tassel. "I am like the tiger. If I miss the first spring I go growing back to the jungle." Subtlety is sacrificed to freshness and vigour. The exaltation, the sweeping magnificence of his effects are consequently most appreciated abroad, where the ineradicable flaws of his style have no power to annoy.

The European fame of Byron was from the first something quite unique. At Missolonghi people ran through the streets crying "The great man is dead—he is gone." His corpse was refused entrance at Westminster; but the poet was taken to the most heart of Russia, Poland, Spain, Italy, France, Germany, Scandinavia, and among the Slavonic nations generally. In Italy his influence is plainly seen in Berchet, Leopardi, Giusti, and even Carducci. In Spain the Myrtle Society was founded in Byron’s honour. Hugo in his Orientales traversed Greece. Chateaubriand joined the Greek Committee. Delavigne dedicated his verse to Byron; Lamartine wrote another canto to Childe Harold; Mérimée is interpenetrated by Byronesque feeling which also animates the best work of Heine, Puchkin, Lermontor, Slowacki and Mickiewicz, and even De Musset.

Like Scott, Byron was a man of two eras, and not too much ahead of his time to hold the Press-Dragon in fee. His supremacy Criticism. and that of his satellites Moore and Campbell were championed by the old papers and by the two new blantlyter Quarterlyes, whose sails were filled not with the light airs of the future but by the Augustan "gales" of the classical party. The distinction of this new phalanx of old-fashioned critics who wanted to confer literature by university degree was that they wrote as gentlemen for gentlemen: they first gave criticism in England a respectable shadeown. Francis Jeffrey, a man of extraordinary ability and editor of The Edinburgh Review from 1803 to 1832 (with the mercurial Sydney Smith, the first of English conversationists, as his aide-de-camp), exercised a powerful influence as a standardizer of the second school. He was one of the first of the critics developing the main idea of literary evolution—the importance of time, environment, race and historical development upon the literary landscape; but he was vigorously aristocratic in his preferences, a hater of mystery, symbolism or allegory, an instinctive individualist of intolerant pattern. His chief weapons against the new ideas were social superiority and omniscience, and he used both unsparingly. The strident political partisanship of the Edinburgh review was within six years a serious rival in the Quarterly, which was edited in turn by the good-natured pedagogue William Gifford and by Scott’s extremely able son-in-law John Gibson Lockhart, the "scorpion" of the infant Blackwood. With the aid of the remnant of the old anti-Jacobins, Canning, Ellis, Barrow, Southey, Croker, Hayward, Apperley and others, the theory of Quarterly infallibility was carried to its highest point of development about 1845.

The historical and critical work of the Quarterly era, as might be expected, was appropriate to this gentlemanly censorship. The thinkers of the day were economic or juristic—Bentham, the great codifier; Malthus, whose theory of population gave Darwin his main impulse to theorise; and Mackintosh, whose liberal opposition to Burke deserved a better fate than it has ever perhaps received. The historians were mainly of the second class—the judicial Hallam, the ornate Roscoe, the plodding Lingard, the accomplished Milman, the curious Isaac D’Israeli, the academic Bishop Thirlwall. Mitford and Grote may be considered in the light of Tory and Radical historical pamphleteers, but Grote’s work has the much larger measure of permanent value. As the historian of British India, James Mill’s industry led him beyond his thesis of Benthamism in practice. Sir William Napier’s heroic picture of the Peninsular War is strongly tinged by bias against the Tory administration of 1808-1814; but it conserves some imperishable scenes of war. Some of the most magnetic prose of the Regency Period was contained in the copious and insinere but profoundly emotionalising pamphlets of the self-taught Surrey labourer William Cobbett, in whom Diderot’s paradox of a comedian is astonishingly illustrated. Lockhart’s Lives of Burns and of Sir Walter Scott—the last perhaps the most memorable prose monument of its epoch—appeared in 1828 and 1838, and both formed the subject of a great article in the Edinburgh Review, where, under the unwelcome discipline of Jeffrey, the few prophet worked nobly though in harness.

Great as the triumph of the Romantic masters and the new ideas was, it is in the ranks of the Old School after all that we have to look for the greatest single figure in the literature of this age. Except in the imitative vein of ballad or folk-song, the poetry of Sir Walter Scott is never quite first-rate. It is poetry for repetition rather than for close meditation or contemplation, and resembles a military band more than a full orchestra. Nor will his prose bear careful analysis. It is a good servant, no more. When we consider, however, not the intensity but the vast extent, range and versatility of Scott’s powers, we are constrained to assign him the first place in his own age, if not that in the next seat to Shakespeare in the whole of the English literary Pantheon. Like Shakespeare, he made humour and a knowledge of human nature his first instruments in depicting the past. Unlike Shakespeare, he was a born antiquary, and he had a great (perhaps excessive) belief in mise en scène, costume, patois and scenic properties generally. His portraiture, however, is Shakespearean in its wisdom and maturity, and, although he wrote very rapidly, it must be remembered that his mind had been prepared by strenuous work for twenty years as a storehouse of material in which nothing was handled until it had been carefully mounted by the imaginative craftsman, and then tested by experimental use. Once he has got the imagination of the reader well grounded to earth, there is nothing he loves.
better than telling a good story. Of detail he is often careless. But he trusted to a full wallet, and rightly, for mainly by his abundance he raised the literature of the novel to its highest point of influence, breathing into it a new spirit, giving it a fulness and universality of life, a romantic charm, a dignity and elevation, and thereby a coherence, a power and predominance which it never had before.

In Scott the various lines of 18th-century conservatism and 19th-century romantic revival most wonderfully converge. His intense feeling for Long Ago made him a romantic almost from his cradle. The master faculties of history and humour made a strong conservative of him; but his Toryism was of a very different spring from that of Coleridge or Wordsworth. It was not a reaction from disappointment in the sequel of 1789, nor was it the result of reasoned conviction. It was indwelling, rooted deeply in the fibres of the soil, to which Scott's attachment was passionate, and nourished as from a source by ancestral sentiment and "heather" tradition. This sentiment made Scott a victorious pioneer of the Romantic movement all over Europe. At the same time we must remember that, with all his fondness for medievalism, he was fundamentally a thorough 18th-century Scotsman and successor of Ballie Nicol Jarvie: a worshipping of good sense, toleration, modern and expert governmental ideas, who valued the past chiefly by way of picturesque relief, and was thoroughly alive to the benefit of peace and orderly rule, and deeply convinced that we are much better off as we are than we could have been in the days of King Richard or good Queen Bess. Scott had the mind of an enlightened 18th-century administrator and statesmen who had made a fierce hobby of armour and old ballads. To expect him to treat of intense passion or romantic medievalism as Charlotte Brontë or Dante Gabriel Rossetti would have treated them is as absurd as to expect to find the sentiments of a Mrs Browning blossoming amidst the horse-play of Tom Jones or Harri Lorrerece. Scott has few niceties or secrets: he was never subtle, morbid or fantastic. His handling is ever broad, vigorous, easy, careless, healthy and free. Yet nobly simple and straightforward as man and writer were, there is something very complex about his literary legacy, which has gone into all lands and created bigoted enemies (Carlyle, Borrow) as well as unexpected friends (Hazlitt, Newman, Jowett); and we can seldom be sure whether his influence is reactionary or the reverse. There has always been something semi-feudal about it. The "shiraz" has a demesne in letters as broad as a countryside, a band of mesne vassals and a host of Eildon hillsmen, Tweedside cottiers, minor feudatories and forest retainers attached to the "Abbotsford Hunt." Scott's humour, humanity and insistence upon the continuity of history transformed English literature profoundly. Scott set himself to coin a quarter of a million sterling out of the new coinage of which he felt himself the Columbus. He failed (quite narrowly), but he made the Novel the paymaster of literature for at least a hundred years. His immediate contemporaries and successors were not particularly great. John Galt (1779-1839), Susan Ferrier (1782-1854) and D. M. Moir (1798-1835) all attempted the delineation of Scottish scenes with a good deal of shrewdness of insight and humour. The main bridge from Scott to the great novelists of the 'forties was supplied since 1837 by the "lay" journals and political novels, represented in turn by Surtees, Smith, Hook, Maxwell, Lever, Maryat, Cooper, Morier, Ainsworth, Bulwer Lytton and Disraeli. Surtees gave all-important hints to Pickwick, Maryat developed grotesque character-drawing, Ainsworth and Bulwer attempted new effects in criminology and contemporary glitter. Disraeli in the 'thirties was one of the foremost romantic wits who had yet attempted the novel. Early in the 'forties he received the laying-on of hands from the Young England party, and attempted to propagate the good tidings of his mission in Coningsby and Sybil, novels full of entretaiment and promise, if not of actual genius. Unhappily the author was enmeshed in the fatal drolleries of the English party system, and Lohair is virtually a confession of abandoned ideals. He completes the forward party in fiction; Jane Austen (1775-1815) stands to this as Crabbe and Rogers to Coleridge and Shelley. She represents the fine flower of the expiring 18th century. Scott could do the trumpet notes on the organ. She fingers the fine ivory flutes. She combines self-knowledge and artistic reticence with a complete tact and an absolute lucidity of vision within the area prescribed. Within the limits of a park wall in a country parish, absolutely oblivious of Europe and the universe, her art is among the finest and most finished that our literature has to offer. She has the style of a way of expression. But the trimmings of her plots and the delicacy of her miniature work have affinities in Maria Edgeworth, Harriet Martineau and Mary Russell Mitford, three excellent writers of pure English prose. There is a finer aroma of style in the contemporary "novels" of Thomas Love Peacock (1785-1866). These, however, are rather tournaments of talk than novels proper, releasing a flood of satiric portraiture upon the idealism of the day—difficult to be apprehended in perfection save by proficient students. Peacock's style had an appreciable influence upon his son-in-law George Meredith (1828-1909). His philosophy is for the most part Tory irritability exploding in ridicule; but Peacock was one of the most lettered men of his age, and his flouts and jeers smack of good reading, old wine and respectable prejudices. In these his greatest successor was George Borrow (1805-1881), who used three volumes of half-imaginary autobiography and road-going in strange lands as a sounding-board for a kind of romantic revolt against the century of comfort, toleration, manufactures, mechanical inventions, cheap travel and commercial expansion, unaccompanied (as he maintains) by any commensurate growth of human wisdom, happiness, security or dignity.

In the year of Queen Victoria's accession most of the great writers of the early part of the century, whom we may denominate as "late Georgian," were silent. Scott, Byron, Shelley, Keats, Coleridge, Lamb, Sheridan, Hazlitt, Mackintosh, Crabbe and Cobbett were gone. Wordsworth, Southey, Campbell, Moore, Jeffrey, Sydney Smith, De Quincey, Miss Edgeworth, Miss Mitford, Leigh Hunt, Brougham, Samuel Rogers were still living, but the vital portion of their work was already done. The principal authors who belong equally to the Georgian and Victorian eras are Landor, Bulwer, Maryat, Hallam, Milman and Disraeli; none of whom, with the exception of the last, approaches the first rank in either. The significant work of Tennyson, the Brownings, Carlyle, Dickens, Thackeray, the Brontës, George Eliot, Mrs Gaskell, Trollope, the Kingsleys, Spencer, Mill, Darwin, Ruskin, Grote, Macaulay, Freeman, Froude, Lecky, Buckle, Green, Maine, Borrow, FitzGerald, Arnold, Rossetti, Swinburne, Meredith, Hardy, Stevenson, Morris, Newman, Pater, Jefferies—the work of these writers may be termed conclusively Victorian; it gives the era a stamp of its own and distinguishes it as the most varied in the whole course of our literature. Circumstances have seldom in the world been more favourable to a great outburst of literary energy. The nation was secure and prosperous to an unexamined degree, conscious of the will and the power to expand still further. The canons of taste were still aristocratic. Books were made and unmade according to a regular standard. Literature was the one form of art which the English understood, and they had always been a loving and regretful, much more than the British, disposed to make their own originality supreme. To the native genius for poetry was now added the advantage of materials for a prose which in lucidity and versatility should surpass even that of Goldsmith and Hazlitt. The diversity of form and content of this great literature was commensurate with the development of human knowledge and power which marked its age. In this and some other respects it resembles the extraordinary contemporary developments that in French literature began under the reign of Louis Philippe. The one signally disconcerting thing about the great Victorian writers is their amazing prolixity. Not content with two or three long books, they write whole literatures. A score of volumes, each as long as the Bible or Shakespeare, barely represents the output of such authors as Carlyle, Ruskin, Froude, Dickens, Thackeray, Newman, Spencer or Trollope.
They obtained vast quantities of new readers, for the middle class was beginning to read with avidity; but the quality of brevity, the knowledge when to stop, and with it the older classic consciousness and the nober Hellenic idea of a perfect measure—these things were as though they had not been. Meanwhile, the old schools were broken up and the foolscap addressed to the old masters. Singers, entertainers, critics and historians abound. Every man may say what is in him in the phrases that he likes best, and the sole motto to them appears to be “every style is permissible except the style that is tiresome.” The old models are strangely disregarded, and the only conventions which hold are those concerning the subjects which English delicacy held to be tabooed. These conventions were inordinately strict, and were held to include all the unrestrained, illicit impulses of love and all the more violent aberrations from the Christian code of faith and ethics. Indulge speculation and the liabilities of lawless love (which had begun to form the staple of the new French fiction—hence regarded by respectable English critics of the time as profoundly vitiated and scandalous) had no recognized existence and were totally ignored in literature designed for general reading. The second or Goody-two-Shoes convention remained strictly in force until the penultimate decade of the 19th century, and was acquiesced in or at least submitted to by practically all the greatest writers of the Victorian age. The great poets and novelists of that day easily outdid the times. Societies and Society had no difficulty in responding to the summons of its literary leaders. Nor was there fame partial, social or sectional. The great novelists of early Victorian days were aristocratic and democratic at once. Their popularity was universal within the limits of the language and beyond it. The greatest of men were men of imagination rather than men of ideas, but such sociological and moral ideas as they derived from their environment were poured helter-skelter into their novels, which took the form of huge pantheological magazines. Another distinctive feature of the Victorian novel is the position it enabled women to attain in literature, a position attained by them in creative work neither before nor since. The novelists to a certain extent created their own method like the great dramatists, but such rigid prejudices or conventions as they found already in possession they respected without demur. Both Dickens and Thackeray write as if they were almost entirely innocent of the existence of sexual vice. As artists and thinkers they were both formless. But the enormous self-complacency of the Englishmen of their time, assisted alike by the part played by the nation from 1793 to 1815, evangelicalism, free trade (which was originally a system of super-nationalism) and later, evolution, generated in them a great benignity and a strong determination towards a liberal and humanitarian philosophy. Despite, however, the diffuseness of the enveloopen and the limitations of horizon referred to, the unboodhish and almost unlettered genius of Charles Dickens (1812–1870), the son of a poor lower middle-class clerk, almost entirely self-educated, has asserted for itself the foremost place in the literary history of the period. Dickens broke every rule, rioted in absurdity and bathed in extravagance. But everything he wrote was received with an almost frantic joy by those who recognized his creations as deifications of themselves, his scenery as drawn by one of the quickest and most sensitive observers that ever lived, and his drollery as an accumulated dividend from the treasury of human laughter. Dickens’s mannerisms were severe, but his geniality as a writer broke down every obstruction, reduced Jeffrey to tears and Sydney Smith to helpless laughter.

The novel in France was soon to diverge and adopt the form of an anecdote illustrating the traits of a very small group of persons, but the English novel, owing mainly to the predilection of Dickens for those Gargantuan entertainers of the Fools, was anchored to the history. William Makepeace Thackeray (1811–1863) was even more historical than Dickens, and most of his leading characters are provided with a detailed genealogy. Dickens’s great works, excepting *David Copperfield* and *Great Expectations*, had all appeared when Thackeray made his mark in 1848 with *Vanity Fair*, and Thackeray follows most of his predecessor’s conventions, including his conventional religion, ethics and politics, but he avoids his worse faults of theatricality. He never forces the note or licenses himself into fury or sentimentality; he limits himself in satire to the polite sphere which he understands, he is a great master of style and possesses every one of its fairy gifts except brevity. He creates characters and scenes worthy of Dickens, but within a smaller range and without the same abundance. He is a traveller and a cosmopolitan, while Dickens is irredeemably Cockney. He is often content to criticize or annotate or to preach upon some congenial theme, while Dickens would be in the flush of humorous creation. His range, it must be remembered, is wide, in most respects a good deal wider than his great contemporary’s, for he is at once novelist, pamphleteer, essayist, historian, critic, and the writer of some of the most delicate and sentimental vers d’occasion in the language.

The absorption of England in itself is shown with exceptional force in the case of Thackeray, who was by nature a cosmopolitan, yet whose work is so absorbed with the structure of English society as to be almost unintelligible to foreigners. The exploration of the human heart and conscience in relation to the new problems of the time had been almost abandoned by the novel since Richardson’s time. It was for woman to attempt to resolve these questions, and with the aid of powerful imagination to propound very different conclusions. The conviction of Charlotte Brontë (1816–1855) was that the mutual passionate love of one man and one woman is sacred and creates a centre of highest life, energy and joy in the world. George Eliot (1819–1880), on the other hand, detected a blind and cruel egoism in all such ecstasy of individual passion. It was in the autumn of 1847 that *Jane Eyre* shocked the prissiness of the coteries by the gratuitous literary world. Another Adam Bede astonished the world by the intensity of its ethical light and shade. The introspective novel was now very gradually to establish a supremacy over the historical. The romance of the Brontës’ forlorn life colours *Jane Eyre*, colours *Wuthering Heights* and colours *Villette*; their work is inseparable from their story to an extent that we perhaps hardly realize. George Eliot did not receive this adventitious aid from romance, and her work was, perhaps, unduly burdened by ethical diatribe, scientific disquisition and moral and philosophical aside. It is more than redeemed, however, by her sovereign humour, by the actual truth in the portrayal of that absolutely self-centred Midland society of the ‘thirties and ‘forties, and by the moral significance which she extracts from the smaller actions and more ordinary characters of life by means of sympathy, imagination and a deep human compassion. Her novels are generally admitted to have obtained twin summits in *Adam Bede* (1859) and *Middemarch* (1872). An even nicer delineator of the most delicate shades of the curiously remote provincial society of that day was Mrs Gaskell (1810–1865), whose *Cranford* and *Wives and Daughters* attain to the perfection of easy, natural and unaffected English narrative. Enthusiasm and a picturesque boyish ardour and partisanship are the chief features of *Westward Ho!* and the other vivid and stirring novels of Charles Kingsley (1819–1875), to which a subterfuge in the discrimination of character must be added in the case of his brother Henry Kingsley (1830–1876). Charles, however, was probably more accomplished as a poet than in the to him too exciting operation of taking sides in a romance. The novels of Trollope, Reade and Wilkie Collins are, generally speaking, a secondary product of the literary forces which produced the great fiction of the ‘fifties. The two last are of great interest. Trollope is a novelist and the prose of every day life with a certainty and a clearness that border upon inspiration. The great novels of George Meredith range between 1859 and 1880, stories of characters deeply interesting who reveal themselves to us by flashes and trust to our inspiration to do the rest. The wit, the sparkle, the entrain and the horizon of these books, from *Richard Feverel* to the master analysis of
The Epistle have converted the study of Meredith into an exact science. Thomas Hardy occupies a place scarcely inferior to Meredith's as a stylist, a discoverer of new elements of the plaintive and the wistful in the vanishing of past ideals, as a depicter of the old southern rustic life of England and its tragi-comedy, in a series of novels which take rank with the greatest.

If Victorian literature had something more than a paragon in Dickens, it had its paragon too in the poet Tennyson. The son of a Lincolnshire parson of squirearchy descent, Alfred Tennyson consecrated himself to the vocation of poetry with the same unalterable conviction that had characterized Milton, Pope, Thomson, Wordsworth and Keats, and that was yet to signalize Rossetti and Swinburne, and he became easily the greatest virtuoso of his time in his art. To lyrics and idylls of a luxurious and exotic picturesque ness he gave a perfection of technique which criticism has chastened only to perfect in such miracles of description as "The Lotus Eaters," "The Dream of Fair Women," and "Morte d'Arthur." He received as vapour the sense of uneasiness as to the problems of the future which pervaded his generation, and in the elegies and lyricis of In Memoriam, in The Princess and in Maud he gave them back to his contemporaries in a running stream, which still sparkles and radiates amid the gloom. After the lyric monodrama of Maud in 1855 he devoted his flawless technique of design, harmony and rhythm to works primarily of decoration and design (The Idyls of the King), and to experiments in metrical drama and of which he was not less occupied. He was varied almost to the last by lyrical blossoms such as "Frater Ave," "Roman Virgil," or "Crossing the Bar," which, like "Tears, Idle Tears" and "O that were possible," embody the aspirations of Faubert towards a perfected art of language shaping as no other verse probably can.

Few, perhaps, would go now to In Memoriam as to an oracle for illumination and guidance as many of Queen Victoria's con temporaries did, from the Queen herself downwards. But Browning. And yet it will take very long ere its fascination fades. In language most musical it rearticulates the gospel of Sorrow and Love, and it remains still a pathetic expression of emotions, sentiments and truths which, as long as human nature remains the same, and as long as calamity, sorrow and death are busy in the world, must be always repeating themselves. Its power, perhaps, we may feel of this poem and indeed of most of Tennyson's poetry, is not quite equal to its charm. And if we feel this strongly, we shall recall Rossetti as the typical poet of the Victorian era. His thought has been compared to a galvanic battery for the use of spiritual paralytics. The grave defect of Browning is that his ideas, however excellent, are so seldom completely won; they are left in a twilight, or even a darkness more Cimmerian than that to which the worst of the virtuosi dedicate their ideas. Similarly, even in his "Dramatic Romances and Lyrics" (1842) or his "Men and Women" (1855) he rarely depicts action, seldom goes further than interpreting the mind of man as he approaches action. If Dickens may be described as the eye of Victorian literature, Tennyson the ear attuned to the subtler melodies, Swinburne the reed to which everything blew to music, Thackeray the velvet pulpit-cushion, Elliot the impending brow, and Meredith the cerebral dome, then Browning might well be described as the active brain itself eternally expounding some point of view remote in time and place from its own. Tennyson was ostensibly and always a poet in his life and his art, in his blue cloak and sombrero, his mind and study alike stored with intangibles of the thought of all ages, always sounding and moulding his verses so that they shall attain the maximum of sweetness and symmetry. He was a recluse. Browning on the other hand dissembled his poethood, successfully disguised his muse under the semblance of a stock merchant, was civil to his fellowmen, and though nervous with boxes encountered every one he met as if he would have recited the whole of it if he could. "Art" was to him the very life. If we consider Browning's poetry we are always discovering new beauties. In Browning's we are finding new blemishes. Why he chose rhythm and metre for seven-eighths of his purpose is somewhat of a mystery. His protest against the materialistic view of life is, perhaps, a more valid one than Tennyson's; he is at pains to show us the noble elements valuable in spite of failure to achieve tangible success. He realizes that the greater the man, the greater is the failure, yet protests unfeignedly against the despondent or materialist view of life. His nimble appreciation of character and motive attracts the attenti ve curiosity of highly intellectual people; but the question recurs with some persistence as to whether poetry, after all, was the right medium for the expression of these views.

Many of Browning's ideas and fertilizations will, perhaps, owing to the difficulty and uncertainty which attaches to their form, penetrate the future indirectly as the stimulant of other men's work. This is especially the case with those remarkable writers who have for the first time given the fine arts a considerable place in English literature, notably John Ruskin (Modern Painters, 1842, Seven Lamps, 1849, Stones of Venice, 1853), William Morris, John Addington Symonds and Walter Pater. Browning, it is true, shared the discipleship of the first two with Kingsley and Carlyle. But Ruskin outlived all discipleships and transcended almost all the prose writers of his period in a style the elements of emotional power in which still preserve their secret.

More a poet of doubt than either Tennyson or the college friend, A. H. Clough, whose loas he lamented in one of the finest pastoral elegies of all ages, Matthew Arnold takes a place among Tennyson, Rossetti and Swinburne among the Dil Majores of Victorian poetry. He is perhaps a disciple of Wordsworth even more than of Goethe, and he finds in Nature, described in rarefied though at times intensely beautiful phrase, the balm for the unrest of man's unsatiated yearnings, the divorce between soul and intellect, and the sense of contrast between the barren toil of man and the magic operaney of nature. His most delicate and intimate strains are tinged with melancholy. The infinite desire of what might have been, the lacrimos erum, inspires "Resignation," one of the finest pieces in his volume of 1849 (The Strayed Reveller). In the deeply-sighed lines of "Dover Beach" in 1867 it is associated with his sense of the decay of faith. The dreaming garden trees, the full moon and the white evening star of the beautiful English-coloured Thyriss evoke the same mood, and render Arnold one of the supreme among elegiac poets. But his poetry is the most individual in the circle and admits the popular heart never for a moment of any standard of man and of the view of the Bible, not as a talisman but as a literature, and, again, as a chastener of his contemporaries by means of the iteration of a few telling phrases about philistines, barbarians, sweetness and light, sweet reasonableness, high seriousness, Hebraism and Hellenism, "young lions of the Daily Telegraph," and "the note of provinciality," Arnold far eclipsed his fame as a poet during his lifetime. His crusade of banter against the bad civilization of his own class was one of the most audaciously successful things of the kind ever accomplished. But all his prose theorizing was excessively superficial. In poetry he sounded a note which the prose Arnold seemed hopelessly unable ever to fathom.

It is easier to speak of the virtuosos group who derived their first incitement to poetry from Chatterton, Keats and the early exotic ballads of Tennyson, far though these yet were from attaining the perfection in which they now appear after half a century of assiduous correction. The chief of them were Dante Gabriel Rossetti, his sister Christina, William Morris and Algernon Charles Swinburne. The founders of this school, which took and acquired the name Pre-Raphaelite, were profoundly impressed by the Dante revival and by the study of the early Florentine masters. Rossetti himself was an accomplished translator from Dante and from Villon. He preferred Keats to Shelley because (like himself) he had no philosophy. He wrote in a broken metre, with a mixture of Greek lucidity and the open air, and prefers lean medieval saints, spectral images and mystic loves. The passion of these students was retrospective; they wanted to revive the literature of a
forgotten past, Italian, Scandinavian, French, above all, medieval. To do this is a question of enthusiastic experiment and adventure. Rossetti leads the way with his sonnets and ballads. Christina follows with *Goblin Market*, though she subsequently, with a perfected technique, writes poetry more and more confined to the religious emotions. William Morris publishes in 1856 his *Defence of Guenevere*, followed in ten years by *The Earthly Paradise*, a collection of medieval tales, which hang in the stream like tapestries woven of golden thread, where we should naturally expect the ordinary paperhanging of prose romance.

From the verdurous gloom of the studio with its mysterious and occult properties in which Rossetti compounded his colours, Morris went forth shortly to chant and then to narrate Socialist songs and parables. Algernon Charles Swinburne set forth to scandalize the critics of 1866 with the roses and lilies of vice and white death in *Poems and Ballads*, which was greeted with bows and hisses, and reproach against a "fleshy school of modern poetry." Scandalous verses these were, rioting on the crests of some of these billows of song. More discerning persons perceived the harmless impersonal unreality and mischievous youthful extravagance of all these Cyprian outbursts, that the poems were the outpourings of a young singer up to the chin in the Flavian flood, and possessed by a poetic energy so young and green that it was in no way analogous to the touchstones of reality or the chastening planes of experience. Swinburne far surpassed the promoters of this exotic school in technical excellence, and in *Atalanta in Calydon* and its successors may be said to have widened the bounds of English song, to have created a new music and liberated a new harmonic scale in its verse. Of the two elements which, superadded to a consummate technique, compose the great poet, intensity of imagination and intensity of passion, the latter in Swinburne much predominated. The result was a great abundance of heat and glow and not perhaps quite enough defining light. Hence the tendency to be incomprehensible, so fatal in its fascination for the poets of the last century, which would almost justify the title of the triunvir of twilight to three of the greatest. It is this incomprehensibility which alienates the poet from the popular understanding and confines his audience to poets, students and scholars. Poetry is often comparable to a mountain range with its points and aiguilles, its peaks and crags, its domes and its summits. But Swinburne's poetry, filled with the sound and movement of great waters, is as incommunicable as the sea. Trackless and almost boundless, it has no points, no definite summits. The poet never seems to know precisely when he is going to stop. His metrical flow is wave-like, beautiful and rather monotonous, inseparable from the general effect. His endings seem due to an exhaustion of rhythm rather than to an exhaustion of sense. A century of reading is insufficient to comprehend it, or to find the thread of magnificent sound.

Akin in some sense to the attempt made to get behind the veil and to recapture the old charms and spells of the middle ages, to discover the open sesame of the *Morte D'Arthur* and the *Mabinogion* and to reveal the old Celtic and monastic life which once filled and dominated our islands, was the attempt to overthrow the twin gods of the 'forties and 'fifties, state-Protestantism and the sanctity of trade. The first generation of the subversively asserted Social Gospel, those kindly folk, who had the idea of becoming men, were John Henry Newman and Thomas Carlyle. The first cause of the movement was, of course, the anomalous position of the Anglican Church, which had become a province of the oligarchy offered by younger sons. It stood apart from foreign Protestantism; its ignorance of Rome, and consequently of what it protested against, was colossal; it was conscious of itself only as an establishment—it had produced some very great men since the days of the non-jurors, when it had missed not its historical conscience, but these had either been great scholars in their studies, such as Berkeley, Butler, Warburton, Thomas Scott, or revivalists, evangelicals and missionaries, such as Wilson, Wesley, Newton, Romaine, Cecil, Venn, Martyn, who were essentially Congregationalists rather than historical Churchmen. A new spiritual beacon was to be raised; an attempt was to be made to realize the historical and cosmic aspects of the English Church, to examine its connexions, its descent and its title-deeds. In this attempt Newman was to spend the best years of his life.

The growth of liberal opinions and the denudation of the English Church of spiritual and historical ideas, leaving 'only pulpit orators at Clapham and Islington and two-bottle orthodoxy' to defend it, seem to involve the continued existence of Anglicanism in any form in considerable doubt. Swift had said at the commencement of the 18th century that if an act was passed for the extirpation of the gospel, bank stock might decline 10%; but a century later it is doubtful whether the passing of such a bill would have left any trace, however evanescent, upon the stability of the money market. The Anglican via media had enemies not only in the philosophical radicals, but also in the new caste of men of science. Perhaps, as J. A. Froude suggests, these combined enemies, *The Edinburgh Review*, Brougham, Mackintosh, the Reform Ministry, Low Church philosophy and the London University were not so very terrible after all. The Church was a vested interest which had a greater stake in the country and was harder to eradicate than they imagined. But it had nothing to give to the historian and the idealist. They were right to fight for what their souls craved after and some of the Church of Andrewes, Herbert, Ken and Waterland. Belief in the divine mission of the Church lingered on in the minds of such men as Alexander Knox or his disciple Bishop Jebb; but few were prepared to answer the question—"What is the Church as spoken of in England? Is it the Church of Christ?"—and the answers were various. Hooker had said it was "the nation"; and in entirely altered circumstances, with some qualifications, Dr Arnold said the same. It was "the Establishment" according to the lawyers and politicians, both Whig and Tory. It was an invisible and mystical body, said the Evangelicals. It was the aggregate of separate congregations, said the Nonconformists. It was the parliamentary creation of the Reformation, said the Erastians. The true Church was the communion of the Pope; the pretended Church was a legalized schism, said the Roman Catholics. All these ideas were floating about, loose and vague, among people who talked much about the Church.

One thing was persistently obvious, namely, that the nationalist Church had become opportunistic in every fibre, and that it had thrown off almost every semblance of ecclesiastical discipline. The view was circulated that the Church owed its continued existence to the good sense of the individuals who officered it, and to the esteem which possession and good sense combined invariably engendered in the reigning oligarchy. But since Christianity was true—and Newman was the one man of modern times who seems never to have doubted this, never to have discovered the unlikelihood of the unlikeliness of the wicked and unbelieving—modern England, with its march of intellect and its chatter about progress, was advancing with a light heart to the verge of a bottomless abyss. By a diametrically opposite chain of reasoning Newman reached much the same conclusion as Carlyle. Newman sought a haven of security in a rapprochement with the Catholic Church. The medieval influences already at work in Oxford began to fan the flames of the maelstrom of the nineteenth century in the *Tracts for the Times*. It proved the turning of the ways leading Keble and Pusey to Anglican ritual and Newman to Rome. This anti-liberal campaign was poison to the state-churchmen and Protestants, and became perhaps the chief intellectual storm centre of the century. Charles Kingsley in 1864 sought to illustrate by recent events that veracity could not be considered a Roman virtue.

But when some preliminary ironic sparring Newman was swung into writing what he deliberately called *Apologia pro vita sua*. In this, apart from the masterly dialectic and exposition in which he had already shown himself an adept, a volume of autobiography is made a chapter of general history, unsurpassed in its kind since the *Confessions* of St Augustine, combined with a perfection of form, a precision
of phrasing and a charm of style peculiar to the genius of the author, but while Newman was then seeking a retreat, some more urgent voices were signalling the advance in a totally opposite direction. The *Apologeta* fell in point of time between *The Origin of Species and Descent of Man*, in which Charles Darwin was laying the corner stones of the new science of which Thomas Huxley and Alfred Russel Wallace were to be among the first apostles, and almost coincided with the *First Principles* of a synthetic philosophy, in which Herbert Spencer was formulating a set of probabilities wholly destructive to the acceptance of any positive truth in any one religion. The typical historian of the *Macaulay*, of the fifties, Thomas Babington Macaulay, and the seminal thinker of the sixties, John Stuart Mill, had as determinedly averted their faces from the old conception of revealed religion. Nourished in the school of the great Whig pamphleteer historians, George Grote and Henry Hallam, Macaulay combined gifts of memory, enthusiastic conviction, portraiture and literary expression, which gave to his historical writing a resonance unequalled (even by Michelet) in modern literature. In spite of faults of taste and fairness, Macaulay's resplendent gifts enabled him to achieve for the period from Charles II. to the peace of Ryswick what Thucydides had done for the Peloponnesian War. The pictures that he drew with such exultant force are stamped ineffaceably upon the popular mind. His chief faults are not of detail, but rather a lack of subtlety as regards characterization and motive, a disposition to envisage history too exclusively as a political and military sequence of isolated events. Carlyle ordered progress towards the material ideals of universal trade and Whig optimism as revealed in the Great Exhibition of 1851. Macaulay's tendency to disparage the past brought his whole vision of the Cosmos into sharp collision with that of his rival, a pupil and an apostle to the historical conscience, Thomas Carlyle, a man whose despair of the present easily exceeded Newman's. But Carlyle's despondency was totally irrespective of the attitude preserved by England towards the Holy Father, whom he seldom referred to save as "the three-hatted Papa" and "servant of the devil." It may be in fact almost regarded as the reverse or complement to the excess of self-complicity in Macaulay. We may correct the excess of one by the opposite excess of the other. Macaulay was an optimist in ecstasy with the material advance of his time in knowledge and power; the growth of national wealth, machinery and means of lighting and locomotion all seemed to glow with satisfaction. Carlyle, on the other hand, regarded all such symptoms of mechanical development as contemptible. Far from panegyrizing his own time, he criticizes it without mercy. Macaulay had great faith in rules and regulations, reform bills and parliamentary machinery. Carlyle regards them as viles of the devil. Frederick William of Prussia, according to Macaulay, was the most execrable of fiends, a cross between Moloch and Puck, his palace was hell, and Oliver Twist and Smike were petted children compared with his son the crown prince. In the same bluff and honest father Carlyle recognized the realized ideal of his fancy and hugged the just man made perfect to his heart of hearts. Such men as Bentham and Cobden, Mill and Macaulay, had in Carlyle's opinion spared themselves no mistaken exertion to exalt the prosperity and happiness of their own day. The time had come to react at all hazards against the prevalent surplus of civilization. Henceforth his literary activity was to take two main directions. First, to demoralize the modern talk about progress by means of money and machinery which emanated like a miaisa from the writings of such men as Mill, Macaulay, Brougham, Buckle and from the Quarterly. Secondly, a cyclopean exhibition of Caesarism, discipline, the regimentation of workers, and the convertibility of the Big Stick and the Bible, with a preference to the Big Stick as a panacea. The snowball was to grow rapidly among such writers as Kingsley, Ruskin, George Borrow, unencumbered by regard for the processes which they advocated. Carlyle himself felt that the condition of England was one for anger rather than discussion. He detested the rationalism and symmetry of such methodists of thought as Mill, Buckle, Darwin, Spencer, Lecky, Ricardo and other demonstrations of the dismal science—merely chatter. He placed an anthrochotomy of the day had become his aversion even more than the swarms of Rome under cover of the Oxford movement which Froude, Borrow and Kingsley set themselves to correct. As an historian of a formal order Carlyle's historical portraits cannot bear a strict comparison with the published work of Gibbon and Macaulay, or even of Maine and Froude in this period, but as a biographer and autobiographer Carlyle's caustic insight has made him to produce much which is of the very stuff of his nature. Surrounded by philomaths and savants who wrote smoothly about the perfectibility of man and his institutions, Carlyle almost alone refused to distil his angry eloquence and went on railing against the passive growth of civilization at the heart of which he declared that he had discovered a cancer. This uncouth Titan worship and prostration before brute force, this constant ranting about jars and vikings trembles often on the verge of cant and comedy, and his fiddling on the one string of human pretension and bankruptcy became discordant almost to the point of chaos. Instinctively destructive, he resents the apostleship of teachers like Mill, or the pioneer discoveries of men like Herbert Spencer and Darwin. He remains, nevertheless, a great incalculable figure, the cross grandfather of a school of thought which is largely unconscious of its debt and which so far as it recognizes it takes Carlyle in a manner wholly different from that of his contemporaries. The retreats of Carlyle and George Eliot (and also of George Borrow) in 1881 make a starting-point for the new schools of historians, novelists, critics and biographers, and those new nature students who claim to cure those evil effects of civilization which Carlyle and his disciples had discovered. History in the hands of Macaulay, Buckle and Carlyle had been occupied mainly with the bias and tendency of change, the results obtained by those who consulted the oracle being more often than not diametrically opposite. With Froude still on the one hand as the champion of Protestantism, and with E. A. Freeman and J. R. Green on the other as nationalist historians, the school of applied history was fully represented in the next generation, but as the records grew and multiplied in print in accordance with the wise provisions made in 1857 by the commencement of the Rolls Series of medieval historians, and the Calendars of State Papers, the theory that History is a science, no less and no more, was propounded in so many words by Professor Bury in his inaugural lecture at Cambridge in 1903, and this view and the corresponding divergence of history from the traditional pathway of Belles Lettres has become steadily more dominant in the world of historical research and historical writing since 1881. The bulk of quite modern historical writing can certainly be justified from no other point of view. New schools. The novel. The theory that History is a science, no less and no more, was propounded in so many words by Professor Bury in his inaugural lecture at Cambridge in 1903, and this view and the corresponding divergence of history from the traditional pathway of Belles Lettres has become steadily more dominant in the world of historical research and historical writing since 1881. The bulk of quite modern historical writing can certainly be justified from no other point of view. The novel. The novel in which the old régime such as Meredith and Hardy, and by those who then ranked even higher in popular esteem such as Wilkie Collins, Anthony Trollope, Besant and Rice, Blackmore, William Black and a monstrous rising regiment of lady novelists—Mrs Lynn Linton, Rhoda Broughton, Mrs Henry Wood, Miss Braddon, Mrs Humphry Ward, the type seemed securely anchored to the old formulas and the old ways. In rest, however, many of these popular workers were already moribund and the novel was being honeycombed by French influence.
This is perceptible in Hardy, but may be traced with greater distinctness in the best work of George Gissing, George Moore, Mark Rutherford, and later on of H. G. Wells, Arnold Bennett and John Galsworthy. The old novelists had left behind them a giant intellectual structure, two of whose pillars were actually gigantic spandrels. They worked in a state of fervent heat above a glowing furnace, into which they flung laugh masses of unshaped metal, caring little for immediate effect or minute dexterity of stroke, but knowing full well that the emotional energy of their temperaments was capable of fusing the most intractable material, and that in the end they would produce their great downright effect. Their spirits rose and fell, but they never flared; copy had to be despatched at once, or the current serial would collapse. Good and bad had to make up the tale against time, and revelling in the very exuberance and excess of their humour, the novelists invariably triumphed. It was incumbent on the new school of novelists to economize their work with more skill, to relieve their composition of irrelevancies, to keep the writing in one key, and to direct it consistently to one end—in brief, to unify the novel as a work of art and to simplify its ordonnance.

The novel, thus lightened and sharpened, was conquering new fields. The novel of the 'sixties remained not, perhaps, to win many new triumphs, but a very popular instrument in the hands of those who performed variations on the old masters, and much later in the hands of Mr William de Morgan, showing a new force and quiet power of its own. The novel, however, was ramifying in other directions in a way full of promise for the future. A young Edinburgh student, Robert Louis Stevenson, had inherited much of the spirit of the Pre-Raphaelite virtuosos, and combined with their passion for the romance of the historic past a curiosity fully as strong about the secrets of romantic technique. A conterie which he formed with W. E. Henley and his cousin R. A. M. Stevenson studied words as a young art student studies pictures, and made studies for portraits of buccaneers with the same minute drudgery that Rossetti had studied a wall or Morris a piece of figured tapestry. While thus forming a new romantic school whose work when brought by his methods should be fit to be grafted upon the picturesque historic fiction of Scott and Dumas, Stevenson was also naturalizing the short story of the modern French type upon English ground. In this particular field he was eclipsed by Rudyard Kipling, who, though less original as a man of letters, had a technical vocabulary and descriptive power far in advance of Stevenson's, and was able in addition to give his writing an exotic quality derived from Oriental colouring. This regional type of writing has since been widely used and the novel of the other half of the century was commonly developed in many other ways, of which perhaps the most significant is the psychological study as manipulated severally by Shorthouse, Mallock and Henry James.

The expansion of criticism in the same thirty years was not a whit less marked than the vast divagation of the novel. In Criticism, the early 'eighties it was still tongue-bound by the hypnotic influence of one or two copy-book formulae—Arnold's 'criticism of life' as a definition of poetry, and Walter Pater's implied doctrine of art for art's sake. That two dicta so manifestly absurd should have cast such an augur-like spell upon the free expression of opinion, though it may of course, like all such instances, be easily exaggerated, is nevertheless a curious example of the enslavement of ideas by a confident claptrap. A few representatives of the old schools of motivated or scientific criticism, deduced from the literatures of past time, survived the new century in Leslie Stephen's Dictionary, Stopford Brooke, Austin Dobson, Courthope, Sidney Colvin, Watts-Dunton; but their agreement is certainly not greater than among the large class of emancipated who endeavour to concentrate the attention of others without further ado upon those branches of literature which they find most nutritious. Among the finest appreciators of this period have been Pattison and Jebb, Myers, Hutton, Dowden, A. C. Bradley, William Archer, Richard Garnett, E. Gosse and Andrew Lang. Birrell, Walkley and Max Beerbohm have followed rather in the wake of the Stephens and Bagehot, who have criticized the sufficiency of the titles made out by the more enthusiastic and lyrical eulogists. In Arthur Symons, Walter Raleigh and G. K. Chesterton the new age possessed critics of great originality and power, the work of the last of whom is conceptual and chamber-like. Ideas about life at large to the conceptions of literature. In exposing palpable nonsense as such, no one perhaps did better service in criticism than the veteran Frederic Harrison.

In the cognate work of memoir and essay, the way for which has been greatly smoothed by co-operative lexicographical efforts such as the Dictionary of National Biography, the New English Dictionary, the Victoria County History and the like, the most illuminating and permeating work of the transition from the old century to the new was done by H. D. Traill, Gosse, Lang, Mackail, E. V. Lucas, Lowes Dickinson, Richardson le Gallienne, A. C. Benson, Hilaire Belloc, while the open-air relief work for dwellers pent in great cities, pioneered by Gilbert White, has been expanded with all the zest and charm that a novel pursuit can endow by such writers as Richardson Jefferyes, an open-air and nature mystic of extraordinary power at his best, Selous, Seton Thompson, W. H. Hudson.

The stage has not been particularly well attuned to the efforts of the newer poets since Coventry Patmore in the Angel in the House achieved embroidery, often extremely beautiful, upon the Tennysonian pattern, and since Edward Fitzgerald, the first of all letter-writing commentators on life and letters since Lamb, gave a new cult to the decadent century in his version of the Persian centoist Omar Khayyam. The prizes which in Moore's day were all for verse have now been transferred to the prose novel and the play, and the poets themselves have played into the hands of the Philistines by disdaining popularity in a fond preference for virtuosity and obscurity. Most kinds of the older verse, however, have been well represented, descriptive and elegiac poetry in particular by Robert Bridges and William Watson; the music of the waters of the western sea and its isles by W. B. Yeats, Synge, Moira O'Neill, "Fiona Macleod " and an increasing group of Celtic bards; the highly wrought verse of the 17th-century bylits by Francis Thompson, Lionel Johnson, Ernest Dowson; the simplicity of an a more popular strain by W. H. Davies, of a brilliant rhetoric by John Davidson, and of a more intimate romance by Sturge Moore and Walter de la Mare. Light verse has never, perhaps, been represented more effectively since Praed and Calverley and Lewis Carroll than by Austin Dobson, Locker Lampson, W. S. Gilbert and Owen Seaman. The names of C. M. Doughty, Alfred Noyes, Herbert French and Laurence Binyon were also becoming prominent at the opening of the new century. For originality in form and substance the palm rests in all probability with A. E. Housman, whose Shropshire Lad opens new avenues and issues, and with W. E. Henley, whose town and hospital poems had a poignant as well as an ennobling strain. The work of Henry Newbolt, Mrs. Meynell and Stephen Phillips showed a real poetic gift. Above all these, however, in the esteem of many reign the verses of George Meredith and of Thomas Hardy, whose Dymas was widely regarded by the best judges as the most remarkable literary production of the new century.

The new printed and acted drama dates almost entirely from the late 'eighties. Tom Robertson in the 'seventies printed nothing, and his plays were at most a timid recognition of the claims of the drama to represent reality and truth. The enormous superiority of the French drama as represented by Augier, Dumas fils and Sardou began to dawn whose two of whom is concentrated upon the application of ideas. The 'eighties came Ibsen, whose daring in handling actuality was only equalled by his intrepid stage-craft. Oscar Wilde and A. W. Pinero were the first to discover how the spirit of these new discoveries might be adapted to the English stage. Gilbert Murray, with his fascinating and tantalizing versions from Euripides, gave a new flexibility to the expansion that was going on in English dramatic ideas. Bernard Shaw and his disciples, conspicuous among them Granville Barker, gave a new seasoning of wit to the absolute novelties of subject, treatment and application with which they
transfixed the public which had so long abandoned thought upon entering the theatre. This new adventure enjoyed a succès de scandale, the precise range of which can hardly be estimated, and the force of which is clearly by no means spent.

English literature in the 20th century still preserves some of the old arrangements and some of the consecrated phrases of patronage and aristocracy; but the circumstances of its production were profoundly changed during the 19th century. By 1895 English literature had become a subject for a regular instruction, and most of the universities, both in England and America. This has begun to lead to research embodied in investigations which show that what were regarded as facts in connexion with the earlier literature can be regarded so no longer. It has also brought comparative and historical treatment of a closer kind and on a larger scale to bear upon the evolution of literary types. On the other hand it has concentrated an excessive attention perhaps upon the grammar and prosody and etymology of literature, it has stereotyped the admiration of lifeless and obsolete forms, and has substituted antiquarian notes and ready-made commentary for that live enjoyment, which is essentially individual and which tends insensibly to evaporate from all literature as soon as the circumstance of it changes. It is prone, moreover, to force upon the immature mind a rapid admiration for the mirror before ever it has scanned the face of the original. A result due rather to the general educational agencies of the time is that, while in the mid-19th century one could be found to write competently on a given subject, in 1910 there were fifty books and apparatus for reading have multiplied in proportion. The fact of a book having been done quite well in a certain way is no longer any bar whatever to its being done again without hesitation in the same way. This continual pouring of ink from one bottle into another is calculated gradually to raise the standard of all subaltern writing and compiling, and to leave fewer and fewer books securelypectable,"meaning" nothing, and retaining of their intrinsic excellence, power and idiosyncrasy or personal charm. Even then, of what we consider first-rate in the 19th century, for instance, but a very small residuum can possibly survive. The one characteristic that seems likely to cling and to differentiate this vulnerable century is its curious reticence, of which the 20th century has already made uncommonly short work. The new playwrights have undertaken England a shyness which can find the time of Shakespeare and Walter Scott. That the best literature has survived hitherto is at best a pious opinion. As the area of experience grows it is more and more difficult to circumscribe or even to describe the supreme best, and such attempts have always been responsible for base superstition. It is clear that some limitation of the literary stock-in-trade will become increasingly urgent as time goes on, and the question may well occur as to whether we are insuring the right baggage. The enormous apparatus of literature at the present time is as naturally advantageous in the peculiar phasis and manner of existence. Some hold to the innate and essential aristocracy of literature; others that it is bound to develop on the popular and communistic side, for that at present, like machinery and other deceptive benefits, it is a luxury almost exclusively advantageous to the rich. But to predict the direction of change in literature is even more futile than to predict the direction of change in human history, for of all factors of history, literature, if one of the most permanent, is also one of the least calculable.

BIBLIOGRAPHICAL NOTE.—The Age of Wordsworth and The Age of Tennyson in Bell's "Handbooks of English Literature" are of special value for this period. Prof. Dowden's and Prof. Snowsby's 19th-century studies fill in interstices; and of the "History of European Literature," the Romantic Revolt and Romantic Triumph are pertinent, as are the literary chapters in vols. x. and xi. of the Century. Of more recent works George Scharf's Literary Currents of the Nineteenth Century, Steedman's Victorian Poets, Holman Hunt's Pre-Raphaelite Brotherhood, R. H. Hutton's Corinthian Thoughts (and companion poems), Sir Leslie Stephen's The Utilitarian, Buxton Forman's Our Living Posts, Dawson's Victorian Noveltists, Thureau-Dangin's Renaissance des idées catholiques en Angleterre, A. Chervillon's Sydney Smith and the Renaissance des idées libérales en Angleterre, A. W. Benn's History of English Thought in the Nineteenth Century, the publishing histories of Murray, Blackwood, Macvey Napier, Lockhart, &c., J. M. Robertson's Modern Humanists, and the critical miscellanies of Lord Morley, Frederic Harrison, W. Bagehot, A. Birrell, Andrew Lang and E. G. Tucour were found, in the translation of literary lives are those of Scott by Lockhart, Carlyle by Froude, Macaulay by Trelvyan, Dickens by Forster and Charlotte Bronté by Mrs Gaskell. (T. S.B.)

ENGLISHRY (Englescherie), a legal name given, in the reign of William the Conqueror, to the presentment of the fact that a person slain was an Englishman. If an unknown man was found slain, he was presumed to be a Norman, and the hundred was fined accordingly, unless it could be proved that he was English. Englishry, if established, excused the hundred. Dr W. Stubbs (Constitutional History, i. 156) says that possibly similar measures were taken by King Canute. Englishry was abolished in 1340.

ENGRAVING, the process or result of the action implied by the verb "to engrave" or mark by incision, the marks (whether for inscriptive, pictorial or decorative purposes) being produced, not by simply staining or discolouring the material (as with paint, pen or pencil), but by cutting into or otherwise removing a portion of the substance. In the case of pictures, the engraved surface is reproduced by printing; but this is only one restricted sense of "engraving," since the term includes seal-engraving (where a cast is taken), and also the chased ornamentation of plate or paper.

The word itself is derived from an O. Fr. engraver (not to be confused with the same modern French word used for the running of a boat's keel into the beach, or for the sticking of a cart's wheels in the mud,—from grè, Provençal grasa, sands of the sea or river shore; cf. Eng. "gravel"); it was at one time supposed that the Gr. γραφέω, to write, was etymologically connected, but this view is not now accepted, and (together with the Ger. Schrift, "writing," the universal word meaning "to write," or the place where the dead are buried) the derivation is referred to a common Teutonic form signifying "to dig" (O. Eng. gravan, Ger. graben). The modern French graver, to engrave, is a later adoption. The idea of a furrow, by digging or cutting, is thus historically associated with an engraving, which may properly include the rudest marks cut into any substance. In old English literature it included carving and sculpture, from which it has become conterminous to differentiate the terminology; and the ancients who chiiselled their writing on slabs of stone were really "engraving." The word is not applicable, therefore, either strictly to lithography (q.v.), nor to any of the photographic processes (see PROCESSES), except those in which the surface of the plate is actually eaten into or lowered. In the latter case, too, it is convenient to mark a distinction and to ignore the strict analogy. In modern times the term is, therefore, practically restricted—outside the spheres of gem-engraving and seal-engraving (see Gem), or the inscribing or ornamenting of stone, plate, glass, &c.—to the art of making original pictures (i.e. by the draughtsman himself, whether copies of an original painting or not), either by incised lines on metal plates (see LINE-ENGRAVING), or by the corrosion of the lines with acid (see Etching), or by the roughening of a metal surface without actual lines (see Mezzotint), or by cutting a wood surface away so as to leave lines in relief (see Wood-ENGRAVING); the result in each case may be called generically an engraving, and in common parlance the term is applied, though incorrectly, to the printed reproduction or "print."

Of these four varieties of engraving—line-engraving, etching, mezzotint or wood-engraving—the woodcut is historically the earliest. Line-engraving is now practically obsolete, while etching and mezzotint have recently come more and more to the front. To the draughtsman the difference in technical handling in each case has in most cases some relation to his own artistic impulse, and to his own feeling for beauty. A line engraver, as P. G. Hamerton said, will not see or think like an etcher, nor an etcher like an engraver in mezzotint. Each kind, with its own sub-varieties, has its peculiar effect and attraction.
ENGROSSING—ENIGMA

A real knowledge of engraving can only be attained by a careful study and comparison of the prints themselves, or of accurate facsimiles, of the books. For so many different kinds of books, each with its own peculiarities, it is difficult for the reader to be aware of their existence, or else for their explanation of technical processes. The value of the prints varies not only according to the artist, but also according to the fineness of the impression, and the “state” (or stage) in the making of the plate, which may be altered from time to time. “Proofs” may also be taken from the plate, and even touched up by the artist, in various stages and various degrees of fineness of impression.

The department of art-literature which classifies prints is called Iconography, and the classifications adopted by iconographers are of the most various kinds. For example, if a complete book were written on Shakespearian iconography it would contain full information about all prints illustrating the life and works of Shakespeare, and in the same way there may be the iconography of a locality or of a single event.

The history of engraving is a part of iconography, and various histories of the art exist in different languages. In England W. Y. Ottley wrote an Early History of Engraving, published in two volumes 4to (1816), and began what was intended to be a series of notices on engravers and their works. The facilities for the reproduction of engravings by the photographic processes have of late years given an impetus to iconography. One of the best modern writers on the subject is J. D. Passavant, whose Le Peintre-graveur (1856) and an introduction to The Study and Collection of Antique Prints (1874) are well known. See also J. M. Darly, The Print Collector (1844); W. H. Wiltshire, Introduction to the Study and Collection of Antique Prints (1874); F. D. Wedmore, Fine Prints (1887). See also the lists of works given under the separate headings for engraving and etching.

ENGROSSING, a term used in two legal senses: (1) the writing or copying of a legal or other document in a fair large hand (en gros), and (2) the buying up of goods wholesale in order to sell at a higher price so as to establish a monopoly. The word “engross” has come into English ultimately from the late Lat. grossus, thick, stout, large, through the A.F. engrossier, Med. Lat. ingrossare, to write in a large hand, and the French grosser, in gross, wholesale. Engrossing and kindred practices of forestalling and regradating were early regarded as serious offences in restraint of trade, and were punishable both at common law and by statute. They were of more particular importance in relation to the distribution of corn supplies. The statute of 1552 defines engrossing as “buying corn growing, or any other corn, grain, butter, cheese, fish or other dead victual, with intent to sell the same again.” The law forbade all dealing in corn as an article of ordinary commerce, apart from questions of foreign import or export. The theory was that when corn was plentiful in any district it should be consumed at what it would bring, without much respect to whether the next harvest might be equally abundant, or to what the immediate wants of an adjoining province of the same country might be. The first statute on the subject appears to have been passed in the reign of Henry III., though the general policy had prevailed before that time both in popular prejudice and in the feudal custom. The statute of Edward VI. (1553) was more stringent, and in it the offences were elaborately defined; by this statute any one who bought corn to sell it again was made liable to two months’ imprisonment with forfeit of the corn. A second offence was punished by six months’ imprisonment and forfeit of double the value of the corn, and a third by the pillory and utter ruin. Severe as this statute was, liberty was given by it to transport corn from one part of the country under licence to men of approved probity, which implied that there was to be some buying of corn to sell it again and elsewhere. Practically “engrossing” came to be considered buying wholesale to sell again wholesale. “Forestalling” was different, and the statutes were directed against a class of dealers who went forward and bought or contracted for corn and other provisions, and spread false rumours in derogation of the public and open markets appointed by law, to which our ancestors appear to have attached much importance, and probably in these times not without reason. The statute of Edward VI. was modified by many subsequent enactments, particularly by the statute of 1663, by which it was declared that there could be no “engrossing” of corn when the price did not exceed 4s. per quarter, and which Adam Smith recognized, though it adhered to the variable and unsatisfactory element of price, as having contributed more to the prosperity of commerce than any previous law in the statute book. In 1773 these injurious statutes were abolished, but the penal character of “engrossing” and “forestalling” had a root in the common law of England, as well as in the popular prejudice, which kept the evil alive to a later period. As the public enlightenment increased the judges were at no loss to give interpretations of the common law consistent with public policy. Subsequent to the act of 1773, for example, there was a case of conviction and punishment for engrossing hops, R. v. Waddington, 1800, 1 East, 143, but though this was deemed a sound and proper judgment at the time, yet it was soon afterwards overthrown in other cases, on the ground that buying wholesale to sell wholesale was not in “restraint of trade” as the former judges had assumed.

In 1800, one John Rusby was indicted for having bought ninety quarters of oats at 4s. per quarter and selling thirty of them at 4s. the same day. Lord Kenyon, the presiding judge, animadverted strongly against the repealing act of 1773, and addressed the jury strongly against the accused. Rusby was heavily fined, but, on appeal, the court was equally divided as to whether engrossing, forestalling and regradating were still offences at common law. In 1844, all the statutes, English, Irish and Scottish, defining the offences, were repealed and with them the supposed common law foundation. In the United States there have been strong endeavours by the government to suppress trusts and combinations for engrossing. (See also TRUSTS; MONOPOLY.)

ENGYON, an ancient town of the interior of Sicily, a Cretan colony, according to legend, and famous for an ancient temple of the Matres which aroused the greed of Verres. Its site is uncertain; some topographers have identified it with Gangi, a town 20 m. S.E. of Cefalu, but only on the ground of the similarity of the two names. See C. Hilsen in Pauly-Wissowa, Realencyclopdie, v. 2568.

ENID, a city and the county-seat of Garfield county, Oklahoma, U.S.A., about 55 m. N.W. of Guthrie. Pop. (1900) 3444; (1907) 10,867 (355 of negro descent); (1910) 13,799. Enid is served by the St Louis & San Francisco, the Atchison, Topeka & Santa Fe, and the Chicago, Rock Island & Pacific railways, and by several branch lines, and is an important railway centre. It is the seat of the Oklahoma Christian University (1907; co-educational). Enid is situated in a flourishing agricultural and stock-raising region, of which it is the commercial centre, and has various manufactures, including lumber, brick, tile and flour. Natural gas was discovered near the city in 1907. Enid was founded in 1893 and was chartered as a city in the same year.

ENIGMA (Gr. ἐνίγμα), a riddle or puzzle, especially a form of verse or prose composition in which the answer is concealed by means of metaphors. Such were the famous riddle of the Sphinx and the riddling answers of the ancient oracles. The composition of enigmas was a favourite amusement in Greece and prizes were often given at banquets for the best solution of them (Athen. x. 457). In France during the 17th century two names stand out: Jean Baptiste Boileau, Charles Riviere Dufresny and J. J. Rousseau did not consider it beneath their literary dignity. In 1646 the abbé Charles Cotier (1604-1682)
ENKHUIZEN—ENNISKILLEN

published a *Racouil des énigmes de ce temps*. The word is applied figuratively to anything inexplicable or difficult of understanding.

**ENKHUIZEN**, a seaport of Holland in the province of North Holland, on the Zuider Zee, and a railway terminus, 114 m. N.E. by E. of Hoorn, with which it is also connected by steam tramway. In conjunction with the railway service there is a steamboat ferry to Stavenoren in Friesland. Pop. (1900) 6885. Enkhuizen, like its neighbour Hoorn, exhibits many interesting examples of Dutch architecture dating from the 15th to 17th centuries, when 't was an important and flourishing city. The façades of the houses are usually built in courses of brick and stone, and adorned with carvings, sculptures and inscriptions. Some ruined gateways belonging to the old city walls are still standing; among them being the tower-gateway called the Dromedar (1540), which overlooks the harbour. The tower contains several rooms, one of which was formerly used as a prison. Among the churches mention must be made of the Zuiderkerk, or South church, with a conspicuous tower (1450–1525); and the Westerkerk, or West church, which possesses a beautifully carved Renaissance screen and pulpit of the middle of the 16th century, and a quaint wooden bell-house (1519) built up for use before the completion of the bell-tower. There are also a Roman Catholic church and a synagogue. The picturesque town hall (1668) contains some finely decorated rooms with paintings by Johan van Neck, a collection of local antiquities and the archives. Other interesting buildings are the orphanage (1616), containing some 17th and 18th century portraits and ancient leather hangings; the weigh-house (1550), the upper story of which was once used by the Surgeons' Guild, several of the windowpanes (dating chiefly from about 1640), being decorated with the arms of various members; the former mint (1611); and the ancient assembly-house of the dike-revees of Holland and West Friesland. Enkhuizen possesses a considerable fishing fleet and has some shipbuilding and rope-making, as well as market traffic.

**ENNERSKING, JOHN JOSEPH** (1841– ), American landscape painter, was born, of German ancestry, in Minster, Ohio, on the 4th of October 1841. He was educated at Mount St Mary's College, Cincinnati, served in the American Civil War in 1861–1865, studied art in New York and Boston, and gave it up because his eyes were weak, only to return to it after failing in the manufacture of tinware. In 1873–1876 he studied in Munich under Schleich and Leier, and in Paris under Daubigny and Bonnat; and in 1878–1879 he studied in Paris again and sketched in Holland. Enneking is a "plein-airist," and his favourite subject is the "November twilight" of New England, and more generally the half lights of early spring, late autumn, and winter dawn and evening.

**ENNIS** (Gaelic, Eanais, an island; Irish, Ennis and Inish), the county town of Co. Clare, Ireland, in the east parliamentary division, on the river Fergus, 25 m. W.N.W. from Limerick by the Great Southern & Western railway. Pop. of urban district (1901) 9093. It is the junction for the West Clare line. Ennis has breweries, distilleries and extensive flour-mills; and in the neighbourhood limestone is quarried. The principal buildings are the Roman Catholic church, which is the pro-cathedral of the diocese of Killaloe; the parish church formed out of the ruins of Ennis Friary, or Enniscorrib Abbey, founded by Carbrig O'Brien; a school on the foundation of Erasmus Smith, and various county buildings. The abbey, though greatly mutilated, is full of interesting details, and includes a lofty tower, a marble screen, a chapter-house, a notable east window, several fine tombs and an altar of St Francis. On the site of the old court-house a colossal statue in white limestone of Daniel O'Connell was erected in 1885. The interesting ruins of Clare Abbey, founded in 1104 by Donnell O'Brien, king of Munster, are half-way between Ennis and the village of Clare Castle. O'Brien also founded Killeone Abbey, beautifully situated on the lough of the same name, 3 m. S. of the town, possessing the unusual feature of a crypt and a holy well. Five miles N.W. of Ennis is Dysert O'Dea, with interesting ecclesiastical remains, a cross, a round tower and a castle. Ennis was incorporated in 1612, and returned two members to the Irish parliament until the Union, and thereafter one to the Imperial parliament until 1885.

**ENNISCORCY**, a market town of Co. Wexford, Ireland, in the north parliamentary division, on the side of a steep hill above the Slaney, which here becomes navigable for barges of large size. Pop. of urban district (1901) 5438. It is 774 m. S. by W. from Dublin by the Dublin & South-Eastern railway. There are breweries and distilleries; tanning, distilling and woollen manufactures are also prosecuted to some extent, and the town is the centre of the agricultural trade for the district, which is aided by the water communication with Wexford. There are important fowl markets and horse-fairs. Enniscorcy was taken by Cromwell in 1649, and in 1798 was stormed and burned by the rebels, whose main forces encamped on an eminence called Vinegar Hill, which overlooks the town from the east. The old castle of Enniscorcy, a massive square pile with a round tower at each corner, is one of the earliest military structures of the Anglo-Norman invaders, founded by Raymond le Gros (1176). Ferns, the next station to Enniscorcy on the railway towards Dublin, was the seat of a former bishopric, and the modernized cathedral, and ruins of a church, an Augustinian monastery founded by Dermot Mac-Mormor about 1160, and a castle of the Norman period, are still to be seen. Ennistully was incorporated by James I., and sent two members to the Irish parliament until the Union.

**ENNISKILLEN, WILLIAM WILLOUGHBY COLE, 3rd Earl of (1807–1886), British palaeontologist, was born on the 25th of January 1807, and educated at Harrow and Christ Church, Oxford. As Lord Cole he early began to devote his leisure to the study and collection of fossil fishes, with his friend Sir Philip de M. G. Egerton, and he amassed a fine collection at Florence Court, Enniskillen—including many specimens that were described and figured by Agassiz and Egerton. This collection was subsequently acquired by the British Museum. He died on the 21st of November 1886, being succeeded by his son (b. 1845) as 4th earl.

The first of the Coles (an old Devonshire and Cornwall family) to settle in Ireland was Sir William Cole (d. 1653), who was "undertaker" of the northern plantation and received a grant of a large property in Fermanagh in 1611, and became provost and later governor of Enniskillen. In 1760 his descendant John Cole (d. 1767) was created Baron Mountflorence, and the latter's son, William Willoughby Cole (1736–1803), was in 1776 created Viscount Enniskillen and in 1789 earl. The 1st earl's second son, Sir Galbraith Lowry Cole (1772–1842), was a prominent general in the Peninsular War, and colonel of the 27th Inniskillings, the Irish regiment with whose name the family was associated.

**ENNISKILLEN, Inniskillings**, a market town and the county town of county Fermanagh, Ireland, in the north parliamentary division, picturesquely situated on an island in the river connecting the upper and lower loughs Erne, 116 m. N.W. from Dublin by the Great Northern railway. Pop. of urban district (1901) 5412. The town occupies the whole island, and is connected with two suburbs on the mainland on each side by two bridges. It has a brewery, tanneries and a small manufactory of cutlery, and a considerable trade in corn, pork and flour. In 1685 Enniskillen was captured by James II. at the battle of Crom; and part of the defenders of the town were subsequently formed into a regiment of cavalry, which still retains the name of the Inniskilling Dragoons. The town was incorporated by James I., and returned two members to the Irish parliament until the Union; thereafter it returned one to the Imperial parliament until 1885. There are wide communications by water by the river and the upper and lower loughs Erne, and by the Ulster canal to Belfast. The loughs contain trout, large pike and other coarse fish. Two miles from Enniskillen in the lower lough is Devenish Island, with its celebrated monastic remains. The abbey of St Mary here was founded by St Molaise (Lasairian) in the 6th century; here too are a fine round tower 85 ft. high, remains of domestic buildings, a holed stone and a tall well-preserved cross. The whole is carefully preserved by...
the commissioners of public works under the Irish Church Act of 1869. Steamers ply between Enniskillen and Belleek on the lower lake, and between Enniskillen and Knockinny on the upper lake.

ENNUS, QUINTUS (239-170 B.C.), ancient Latin poet, was born at Rudiae in Calabria. Familiar with Greek as the language in common use among the cultivated classes of his district, and with Oscan, the prevailing dialect of lower Italy, he further acquainted himself with Latin after the best and noblest manner of acquiring knowledge of it (Gellius xvi. 17), he had three "hearts" (corda), the Latin word being used to signify the seat of intelligence. He is said (Servius on Æn. vii. 691) to have claimed descent from one of the legendary kings of his native district, Messapus the eponymous hero of Messapia, and this consciousness of ancient lineage is in accordance with the high self-confident tone of his mind, with his sympathy with the dominant genius of the Roman republic, and with his personal relations to the members of her great families. Of his early years nothing is directly known, and we first hear of him in middle life as serving during the Second Punic War, with the rank of centurion, in Sardinia, in the year 204, where he attracted the attention of Cato the elder, and was taken by him to Rome in the same year. Here he taught Greek and adapted Greek plays for a livelihood, and by his poetical compositions gained the friendship of the greatest men in Rome. Among these were the elder Scipio and Fulvius Nobilior, whom he accompanied on his Aetolian campaign (198). Through the influence of Nobilior's son, Ennius subsequently obtained the privilege of Roman citizenship (Cicero, Brutus, 20. 70). He lived plainly and simply on the Aventine with the poet Caecilius Statius. He died at the age of 70, immediately after producing his tragedy Thesmophoria. In the last book of his epic poem, in which he seems to have given various details of his personal history, he mentions that he was in his 67th year at the date of its composition. He compared himself, in comparison with that of the great work of his life, to a gallant horse which, after having often won the prize at the Olympic games, obtained his rest when weary with age. A similar feeling of pride at the completion of a great career is expressed in the memorial lines which he composed to be placed under his bust after death,— "Let no one weep for me, or celebrate my funeral with mourning; for I still live, as I pass to and fro through the mouths of men." From the impression stamped on his remains, and from the testimony of his countrymen, we think of him as a man of a robust, sagacious and cheerful nature (Hor. Ep. ii. 1. 50; Cic. De sen. 5); of great industry and versatility; combining imaginative enthusiasm and a vein of religious mysticism with a sceptical indifference to popular beliefs and a scorn of religious imposture; and tempering the grave seriousness of a Roman with a genial capacity for enjoyment (Hor. Ep. i. 19. 7). Till the appearance of Ennius, Roman literature, although it had produced the epic poem of Naevius and some adaptations of Greek tragedy, had been most successful in comedy. Naevius and Plautus were men of thoroughly popular fibre. Naevius suffered for his attacks on members of the aristocracy, and, although Plautus carefully avoids any direct notice of public matters, yet the bias of his sympathies is indicated in several passages of his extant plays. Ennius, on the other hand, was by temperament in thorough sympathy with the dominant aristocratic element in Roman life and institutions. Under his influence literature became less suited to the popular taste, more especially addressed to a limited and cultivated class, but at the same time more truly expressive of what was greatest and most worthy to endure in the national sentiment and traditions. He was a man of many-sided activity. He devoted attention to questions of Latin orthography, and is said to have been the first to introduce shorthand writing in Latin. He attempted tragedy, but with so little success that in North of Volcius Sedigetus he is mentioned, solely as a mark of respect "for his antiquity," tenth and last in the list of comic poets. He may be regarded also as the inventor of Roman satire, in its original sense of a "medley" or "miscellany," although it was by Lucullus that the character of aggressive and censored criticism of men and manners was first imparted to that form of literature. The word satura was originally applied to a rude scenic and musical performance, exhibited at Rome before the introduction of the regular drama. The satyrica of Ennius were collections of writings on various subjects, written in various metres and contained in four (or six) books. Among these were included metrical versions of the physical speculations of Epicurus, of the gastronomic researches of Archestratus of Gela (Hedyphegetia), and, probably, of the rationalistic doctrines of Euhemerus. It may be noticed that all these writers whose works were thus introduced to the Romans were Sicilian Greeks. Original compositions were also contained in these satyrica, and among them the panegyric on Scipio, unless this was a drama. The satire of Ennius seems to have resembled the more artistic satire of Horace in its record of personal experiences, in the occasional introduction of dialogue, in the use made of fables with a moral application, and in the didactic office which it assumed.

But the chief distinction of Ennius was gained in tragic and narrative poetry. He was the first to impart to the Roman adaptations of Greek tragedy the masculine dignity, pathos and oratorical fervour which continued to animate them in the hands of Pacuvius and Accius, and, when set off by the acting of Aesopus, called forth vehement applause in the age of Cicero. The titles of about twenty-five of his tragedies are known to us, and a considerable number of considerable numbers of fragments, a few words to about fifteen lines, have been preserved. These tragedies were for the most part adaptations and, in some cases, translations from Euripides. One or two were original dramas, of the class called proeuctae, i.e. dramas founded on Roman history or legend; thus, the Ambracia treated of the capture of that city by his patron Nobilior, the Sabinae of the rape of the Sabine women. The heroes and heroines of the Trojan cycle, as Achillas, Ajax, Telamon, Cassandra, Andromache, were prominent figures in some of the dramas adapted from the Greek. Several of the more important fragments are found in Cicero, who expresses a great admiration for their many fortitude and dignified pathos. In these remains of the tragedies of Ennius we can trace indications of strong sympathy with the noble and bolder elements of character, of vivid realization of impassioned situations, and of sagacious observation of life. The frank bearing, fortitude and self-sacrificing heroism of the best type of the soldierly character find expression in the persons of Achilles, Telamon and Euryylyus; and a dignified and passionate tenderness of feeling makes itself heard in the lyrical utterances of Cassandra and Andromache. The language is generally nervous and vigorous, occasionally vivified with imaginative energy. But it flows less smoothly and easily than that of the dialogue of Latin comedy. It shows the same tendency to aim at effect by alliterative and assonantal sound, and plays on words. The richness of early art is most apparent in the inequality of the metres in which both the dialogue and the "recitative" are composed.

But the work which gained him his reputation as the Homer of Rome, and which called forth the admiration of Cicero and Lucretius and frequent imitation from Virgil, was the Annales, a long narrative poem in eighteen books, containing the record of the national story from mythical times to his own. Although the whole thorougb of the work implies that confusion of the provinces of poetry and history which was perpetuated by later writers, and especially by Lucon and Silius Italicus, yet it was a true instinct of genius to discern in the idea of the national destiny the only possible motive of a Roman epic. The execution of the poem (to judge from the fragments, amounting to about six hundred lines), although rough, unequal and often prosaic, seems to have combined the realistic fidelity and freshness of feeling of a contemporary chronicle with the vivifying and idealizing power of genius. Ennius prided himself especially on being the first to form the strong voice of Latium into the mould of the Homeric hexameter in place of the old Saturnian metre. And although it took several generations of poets to beat their music out to the perfection of the Virgilian cadences, yet in the rude adaptation of Ennius the secret of what ultimately
became one of the grandest organs of literary expression was first discovered and revealed. The inspiring idea of the poem was accepted, purified of all alien material, and realized in artistic shape by Virgil in his national epic. He deliberately imparted to that poem the charm of antique associations by incorporating with it much of the phraseology and sentiment of Ennius. The occasional references to Roman history in Lucretius are evidently reminiscences of the Annales. He as well as Cicero speaks of him with pride and affection as "Ennius noster." 1 Of the great Roman writers Horace had least sympathy with him; yet he turned to the highest esteem in which he was held during the Augustan age. Ovid expresses the grounds of that esteem when he characterizes him as

"Ingenio maximius, arte rudis." 2

A sentence of Quintilian expresses the feeling of reverence for his genius and character, mixed with distaste for his rude workmanship, with which the Romans of the early empire regarded him: "Let us reverence Ennius as we reverence the sacred groves, hallowed by antiquity, whose massive and venerable oak trees are not so remarkable for beauty as for the religious awe which they inspire" (Inst. or. x. 1. 88).

Editions of the fragments by L. Müller (1884), L. Valmaggi (1900, with notes), L. Vahlen (1903), monographs by M. Mommsen (1887), Ralph von Hebel (1889), M. Mommsen, History of Rome, bk. iii. ch. 14. On Virgil's indebtedness to Ennius see V. Crivelli, Qua propter hostis Vergilis Ennius (1886).

ENNODIUS, MAGNUS FELIX (A.D. 474–502), bishop of Pavia. Latin rhetorician and poet. He was born at Arelius (Arles) and belonged to a distinguished but impious family. Having lost his parents at an early age, he was brought up by an aunt at Ticinum (Pavia); according to some, at Mediolanum (Milan). After her death he was received into the family of a pious and wealthy young lady, to whom he was betrothed. It is not certain whether he eventually married this lady; she seems to have lost her money and retired to a convent, whereupon Ennodius entered the Church, and was ordained deacon (about 493) by Epiphanius, bishop of Pavia. From Pavia he went to Milan, where he continued to reside until his elevation to the see of Pavia about 513. During his stay at Milan he visited Rome and other places, where he gained a reputation as a teacher of rhetoric. As bishop of Pavia he played a considerable part in ecclesiastical affairs. On two occasions (in 515 and 517) he was sent to Constantinople by Theodoric on an embassy to the emperor Anastasius, to endeavour to bring about a reconciliation between the Eastern and Western churches. He died on the 17th of July 521; his epitaph still exists in the basilica of St Michael at Pavia (Corpus Inscriptionum Latinarum, v. pt. ii. No. 6964).

Ennodius is one of the best representatives of the twofold (pagan and Christian) tendency of the 6th-century literature, and of the Gallo-Roman clergy who upheld the cause of civilization and classical literature against the invasions of barbarism. But his anxiety not to fall behind his classical models—the chief of whom was Virgil—his striving after elegance and grammatical correctness, and a desire to avoid the commonplace have produced a turgid and affected style, which, aggravated by rhetorical exaggerations and popular barbarisms, makes his works difficult to understand. It has been remarked that his poetry is less unintelligible than his prose.

The numerous writings of this versatile ecclesiastic may be divided into (1) letters, (2) miscellaneous, (3) discourses, (4) poems. The lettera on a variety of subjects, addressed to high church and state officials, are admirable for their seriousness and political shrewdness of the missellians, the most important are: The Panegyric of Theodoric, written to thank the Arian prince for his tolerance of Catholicism and support of Pope Symmachus (probably delivered before the king on the occasion of his entry into Ravenna or Milan); like all similar works, it is full of flattery and exaggeration, but if used with caution is a valuable authority; The Life of St Epiphanius, bishop of Pavia, the best and the most important of all his works, with an interesting picture of the political activity and influence of the church; Escharciscon de Vido Sue, a sort of "confessions," after the manner of Augustine; the exposition of the enfanchisement of a slave with religious formalities in the presence of a bishop; Paraenesis didascalica, an educational guide, in which the claims of grammar as a preparation for the study of rhetoric, the mother of all the sciences, are strongly insisted on. The discourses (Dictiones) are sacred, scholastic, controversial and ethical. The discourse on the Controversiae of the elder Seneca; the ethical harangues of the Didascaliae, descriptions of a journey from Milan to Brigantium (Briançon) and of a trip on the Po; an apology for the study of profane literature; an apothalaurum, in which Love is introduced as executing Christianity; a dozen hymns, after the manner of St Ambrose, probably intended for church use; epigrams on various subjects, some being epigrams proper—inscriptions for tombstones, baptistries—other imitations of Martial, satiric pieces and descriptions of scenery.

There are two excellent editions of Ennodius by G. Hartel (vol. vi. of Corpus scriptorum ecclesiasticon Latinurn, Vienna, 1882) and F. Vogel (vol. viii. of Monumenta Germanicu historica, 1895, with exhaustive prolegomena). On Ennodius generally consult M. Fertig, Ennodius und seine Zeit (1855–1860); A. Dubois, La Littérature d'Ennodius (1903); F. Magani, Ennodio (1908), and A. Ebert, Allgemeine Geschichte der Lit. des Mittelalters im Abend- lande, i. (1896); M. Mamius, Geschichte der christlich-lateinischen Theologie (1889). French translation by abbé S. Léglise (Paris, 1896 fol.).

ENNIS, a town of Austria, in upper Austria, 11 m. by rail S.E. of Linz. Pop. (1900) 4372. It is situated on the Enns near its confluence with the Danube and possesses a 15th-century castle, an old Gothic church, and a town hall erected in 1565. Three miles to the S.W. lies the Augustinian monastery of St Florian, one of the oldest and largest religious houses of Austria. Founded in the 7th century, it was occupied by the Benedictines till the middle of the 11th century. It was established on a farm basis in 1071, when it passed into the hands of the Augustinians. The actual buildings, which are among the most magnificent in Austria, were constructed between 1668 and 1745. Its library, with over 70,000 volumes, contains valuable manuscripts and also a fine collection of coins. Enns is one of the oldest towns in Austria, and stands near the site of the Roman Laurocunum. The nucleus of the actual town was formed by a castle, called Anasburg or Aensburg, erected in 900 by the Bavarians as a post against the incursions of the Hungarians. It soon attained commercial prosperity, and by a charter of 1213 it was made a free town. In 1725 it passed into the hands of Rudolph of Habsburg. An encounter between the French and the Austrian troops took place here on the 5th of November 1809.

ENOCH (הַמָּשָּׁמָה, הַמַּשָּׁם, Hânôkh, Teaching or Dedication). (1) In Gen. iv. 17, 18 (J), the eldest son of Cain, born while Cain was building a city, which he named after Enoch; nothing is known of the city. (2) In Gen. v. 24, 25, and (P), senekkah in descent from Adam in the line of Seth; he "walked with God," and after 365 years "was not for God took him." [(1) and (2) are often regarded as both corruptions of the sephenih primitive king Evedorachos (Emmeduranki in cuneiform inscriptions), the two genealogies, Gen. iv. 16–24, v. 12–17, being variant forms of the Babylonian list of primitive kings. Emmeduranki is the favourite of the sun-god, cf. Enoch's 365 years.1] Heb. xi. 5 says Enoch "was not found, because God translated him." Later Jewish tradition represented him as receiving revelation from God, and as the first author; apparently following the Babylonian account which makes Emmeduranki receive instruction in all wisdom from the sun-god.2 Two apocryphal works written in the name of Enoch are extant, the Book of Enoch, compiled from documents and works written 200–500 B.C., quoted as the work of Enoch, Jude 14 and 15, and the Book of the Secrets of Enoch, A.D. 1–50. Cf. 1 Chron. i. 3; Luke iii. 37; Wisdom iv. 7–14; Eccles. xlv. 16, 17. (3) Son, i.e. clan, of Midian, in Gen. xxiv. 4; 1 Chron. vi. 15. (4) Son, i.e. clan, of Benjamin, in Gen. xlix. 6; Exod. vi. 5; Exod. vi. 14; Num. xxvi. 5; 1 Chron. v. 3. There may have been some historical connexion between these two clans with identical names.

Enoch, Book of. The Book of Enoch, or, as it is sometimes called, the Ethiopic Book of Enoch, in contradistinction to the Stonic Book of Enoch (see below), is perhaps the most important of all the apocryphal and pseudopaulinical Biblical works preserved in the history of religious thought. It is not the work of a single author, but rather a conglomerate of literary fragments which once circulated under the names of Enoch, Noah and possibly Methuselah. In the Book of the Secrets of Enoch we have additional portions of this literature. As the former work is derived from a variety of Pharisaean writers in Palestine, so the latter in its present form was written for the most part by Hellenistic Jewry in Egypt.

The Book of Enoch was written in the second and first centuries B.C. It was well known to many of the writers of the New Testament, and in many instances influenced their thought and diction. Thus it is quoted as a genuine production of Enoch in the Epistle of Jude, 14 sq., and it lies at the base of Matt. xix. 28 and John v. 22, 27, and many other passages. It had also a vast indirect influence on the Palestinian literature of the 1st century of our era. Like the Pentateuch, the Psalms, the Midrashim, and the Dead Sea Scrolls, it was divided into five parts, with the critical discussion of which we shall deal below. As the earlier Fathers and Apologists it had all the weight of a canonical book, but towards the close of the 3rd and the beginning of the 4th century it began to be discredited, and finally fell under the ban of the Church. Almost the latest reference to it in the early church is made by George Synkellos in his Chronography about A.D. 800. The book was then lost sight of till 1773, when Bruce discovered the Ethiopic version in Abyssinia.

Original Language. That the Book of Enoch was written in Semitic is now accepted on all hands, but scholars are divided as to whether the Semitic language in question was Hebrew or Aramaic. Only one valuable contribution on this question has been made, and that by Halévy in the Journal asiatique, Avril-Mai 1867, pp. 352-365. This scholar is of opinion that the entire work was written in Hebrew. Since this publication, however, fresh evidence bearing on the question has been discovered in the Greek fragment (1-xxxii.) found in Egypt. Since this fragment contains three Aramaic words transliterated in the Greek, some scholars, and among them Schürer, Lévi and N. Schmidt, have concluded that not only are chapters i-xxxvi. derived from an Aramaic original, but also the remainder of the book. In support of the latter statement no evidence has yet been offered by these or any other scholars, nor has there been any attempt to meet the positive arguments of Halévy for a Hebrew original of xxxvii.-civ., whose Hebrew reconstructions of the text must be accepted and must be adopted by every editor and translator of the book. A prolonged study of the text, which has brought to light a multitude of fresh passages the majority of which can be explained by retranslation into Hebrew, has convinced the present writer that, whilst the evidence on the whole is in favour of an Aramaic original of vii.-xxxvi., it is just as conclusive on behalf of the Hebrew original of the greater part of the rest of the book.

Versions.—Greek, Latin and Ethiopic. The Semitic original was lost after the 4th century. It is improbable that there were two distinct Greek versions. Of the one, several fragments have been preserved in Synkellos (A.D. 800), vi.-x. 14, viii. 4.-ix. 4, xv.-xvi. 1; of the other, i-xxxii. in the Giza Greek fragment discovered in Egypt and published by Bourliot (Fragmenta grecos du livre d’Enoch), in 1882, and subsequently by Lods, Dillmann, Charles (Book of Enoch, 318 sqq.), Swete, and finally by Radermacher and Charles (Ethiopic Text, 3-75). In addition to these fragments there is what of lxxiii.-xxiv (see Gildemeister in the ZDMG, 1895, pp. 621-624, and Charles, Ethiopic Text, pp. 175-177). Of the Latin version only i-9 survives, being preserved in the Pseudo-Cyprian’s Ad Noetianum, and civ. 1-18 discovered by James in an 8th-century MS. of the British Museum (see James, Apoc. anedota, 146-200; Charles, op. cit. 219-222). This version is made from the Greek.

The Ethiopic version, which alone preserves the entire text, is a very faithful translation of the Greek. Twenty-eight MSS. of this version are in the different libraries of Europe, of which fifteen have been found in England. This version was made from an ancestor of the Greek fragment discovered at Giza. Some of the utterly unintelligible passages in this fragment are literally reproduced in the Ethiopic. The same wrong order of the text in vii.-viii. is common to both. In order to recover the original text, it is from time to time necessary to retranslate the Ethiopic into Greek, and the latter in turn into Aramaic or Hebrew. By this means we are able to detect dittypographies in the Greek and variants in the original Semitic. The original was written to a great extent in verse. The discovery of this fact is most helpful in our criticism of the text. This version was first edited by Laurence in 1853 from one MS., in 1851 by Dillmann from five, in 1902 by Fleming from fifteen MSS., and in 1906 by the present writer from twenty-three.

Translations and Commentaries.—Laurence, The Book of Enoch (Oxford, 1821), Dillmann, Das Buch Hanoch (1853); Schodde, The Book of Enoch (1882), Charles, The Book of Enoch (1893); Beer, Das Buch Hanoch, 3 vols.; James, Jüdische Studien, i. 207-209, and a short critical account of the most important of these in Charles, op. cit. pp. 9-21.

The different Elements in the Book, with their respective Characters and Dates.—We have remarked above that the Book of Enoch is divided into five parts—i.-xxxvi., xxxvii.-lxxi., lxxii.-lxxxii., lxxxii.-xc., cix-cvii. Some of these parts constituted originally separate treatises. In the course of their reduction and incorporation into a single work they suffered much mutilation and loss. From an early date the compositeness of the work was recognized. Scholars have varied greatly in their critical analyses of the work (see Charles, op. cit. 6-21, 305-312). The analysis which gained most acceptance was that of Dillmann (Herzog’s Realencyclop. xii. 350-352), according to whom the present books consist of—(1) the groundwork, i.e. i.-xxxvi., lxxii.-cv., written in the time of John Hyrcanus; (2) xxxvii.-lxxi., lxxii.-xc., before 64 B.C.; (3) the Noachic fragments, vi.-xii.; (4) xiii.-xx.; (5) xxi.-xxiv.; (6) xxxvii.-lxxx.; (7) lxix.-lxxii.; (8) lxxxii.-xc.; (9) xci.; (10) xcvii.; (11) xcviii.; (12) cvii., and from the Noah tradition; (13) vi.-xi.; (14) xxi.-xxiv. 1-20, li.-lii., liii.-lxxx.; (15) cviii. Thus while Dillmann finds eleven separate sources, Beer finds fifteen. A fresh study from the hand of Appel (Die Composition des dichtischen Henochschriften, 1906) seeks to reach a final analysis of the Hebrew, but in spite of its evident importance and insight, it cannot escape the charge of extravagance. The original book or ground-work of Enoch consisted of i.-xvi., xx.-xxxvi. This work called forth a host of imitators, and a number of their writings, together with the groundwork, were edited as a Book of Methuselah, i.e. lxxii.-cv. Then came the final redactor, who interpolated the groundwork and the Methuselah sections, adding two others from his own pen. The Similitudes he worked up from a series of later sources, and gave them the second place.
ENoch, Bkook OF

in the final work authenticating them with the name of Noah. The date of the publication of the entire work Appel assigns to the years immediately following the death of Herod.

We shall now give an analysis of the book, with the dates of the various sections where possible. Of these we shall deal with the easiest first. Chaps. xxxii.-lxxxvi. constitutes a work in itself, the writer of which, whether he was the same as the author of the rest of the book, is unknown. His sole aim is to give the law of the heavenly bodies. His work has suffered disarrangements and interpolations at the hands of the editor of the whole text. Thus lxxvi.-lxxxvii., which concerns the wind, is not connected with the wind, and the laws of the heavenly bodies. Certain geographical matters, and lxxxvi., which is concerned wholly with ethical matters, are foreign to a work which professes in its title (lxxvi. i) to be the law of the heavenly bodies. The laws themselves are also corrupt. Finally, lxxxvii. should stand before lxxxvi., for the opening words of the latter suppose it to be already read. The date of this section can be partially established, for it was known to the authors of Jubilees, and was therefore written before the last third of the 2nd century B.C.

Chaps. lxxxviii.-xc.—This section was written before 161 B.C., for John Hyrcanus (Acts xii. 13), who was still living, was still reigning, and was therefore writing, 161 B.C. (Dillmann, Schürer and others take the great horn to be John Hyrcanus, but this interpretation does not hold.) In this section the Messiah is to be established as the law-giver, and the Jerusalem city-state is set up by God Himself.

Chaps. xci.-xcii.—In the preceding section the Maccabees were the religious champions of the nation and the friends of the Messiah. In the present section the Sadducees and the Pharisees are the chief parties, and the Pharisees (the Sadducees are not yet recognized by the Laws of Deuteronomy), and the general public are the main points of interest. This section was written therefore after 134 B.C., when the breach between John Hyrcanus and the Pharioses took place, and the latter became the first opponents of the former (of the former, B.C.x.). For it is not likely that in a book dealing with the sufferings of the Pharisees such a reference would be omitted. These chapters indicate a revolution in the religious hopes of the nation. An eternal Messiah is no longer the hope of the nation, but only an eternal God, appointed by God Himself, and the son of man (lxxxviii. 5). This is therefore the real end of the book, as seen by the latter part of the book (lxxvi.-lxxxvi. 1), and by the writer of lxxxvii. 6.

Chaps. xxciii.-xcvi.—This is the most difficult section of the book. It is very composite. Chaps. vi.-xii. is apparently an independent fragment. It is an apocalyptic Scapegoat. It is therefore the oldest part, and the three main parts of the book of Scapegoat are the story of Scapegoat, the story of the Scapegoat, and the story of the Scapegoat, and each of these parts is a different story. The Scapegoat is a story of the Scapegoat, and the story of the Scapegoat is a different story. The Scapegoat is a story of the Scapegoat, and the story of the Scapegoat is a different story. The Scapegoat is a story of the Scapegoat, and the story of the Scapegoat is a different story.

Chaps. xxxvi.-lxxviii.—These constitute the well-known Similitudes. They were written before 64 B.C., for Rome was not yet known to the writer, and after 95 B.C., for the slaying of the righteous of which the writer complains, was not perpetrated by the Maccabean princes before the year 95 B.C. This section consists of three similitudines—xxxvi.-xxxvii., lxxvii.-lxxxvi., lxxxvi.-lxxxviii. These are introduced and concluded by xxxviii., and lxxxviii. There are many interpolations—lxxvii.-lxxxviii. 25 confusedly from the Book of Noah; most probably xxviii. 2. Where xxxviii. 19 reads "in spring is doubtful. Chaps. i., lvi.-lvii. 32 are likewise insertions.

In R. H. Charles's edition of Enoch, xxxvi. xxvii. is bracketed as an interpolation. The writer of the latter section is referred to as a "son of man." The name of the Similitudes though it is dislocated from its original context. It presents two visits of Enoch to heaven in lxxxi. 1-4 and lxxxi. 5-17. The extraordinary statement in lxxxi. 14, according to which Enoch is addressed as "the Son of Man," is seen, as Appel points out, on examination of the context to have arisen from the loss of a portion of the text after verse 13, in which Enoch saw a heavenly being who was called "the angel who was to the sight of man." This being was then. Then comes ver. 14, which, owing to the loss of this passage, has assumed the form of an address to Enoch: "Thou art the Son of Man," but which stood originally as the angel's reply to Enoch: "This is the Son of Man," &c. Ver. 15., then, gives the message sent to Enoch by the Son of Man. In the next verse the second person should be changed into the third. Thus we recover the original text of this difficult chapter. The Messianic doctrine and eschatology of this section is unique. The Messiah is here for the first time described as the pre-existent Son of Man (xxxvi. 2), who sits on the throne of God (lxxvi. 2), and is called the angel who was to the sight of man (lxxvi. 6), and is the Judge of all mankind (lxxvi. 27). After the judgment there will be a new heaven and a new earth, which will be the abode of the blessed.

The Book of the Secrets of Enoch, or Slavonic Enoch. This new fragment of the Enochic literature has only recently come to light through the discovery of a Slavonic text in the library of the Russian Academy at St. Petersburg. Since about A.D. 500 it has been lost sight of. It is cited without acknowledgment in the Book of Adam and Eve, the Apocalypses of Moses and Paul, the Sibylline Oracles, the Ascension of Isaiah, the Epistles of Barnabas, and referred to by Origen and Irenaeus (see Charles, The Book of the Secrets of Enoch, 1820, pp. xvi.-xvii.).

For Charles's edition of this work, in 1895, Professor Morfill translated two of the best MSS., as well as Sokolov's text, and was also quoted on the authority of other MSS. In 1896 Bonnet issued his Das slavische Ennochbuch, in which the relation of the above two MSS. is given side by side, preceded by a short introduction.

Analysis.—Chaps. i.-iv. Introduction: life of Enoch: his dream, in which he is told that he will be taken up to heaven: his admonitions to his sons. i.-xxxvi. What Enoch saw in heaven. iii.-vi. The first heaven: the rulers of the stars: the great sea and the treasures of snow, &c. vii. The second heaven: the fallen angels. vii.-ix. The third heaven: paradise and place of punishment. ix.-xii. The fourth heaven: the gates of the three friends of the enochs. xii.-xvii. The fifth heaven: the watchers mourning for their fallen brethren. xiv. The sixth heaven: seven bands of angels arrange and study the courses of the stars, &c. seventh heaven: the souls of men. xvii.-xviii. The seventh heaven: the Lord sitting on His throne with the ten chief orders of angels. Enoch is clothed by Michael in the raiment of God, and in the secrets of the secrets of the secrets of the secrets of all the assembled people at Achthusian. xiv.-xviii. Enoch's translation. Rejoicing of the people on behalf of the revelation given them through Enoch.

Language and Place of Writing.—A large part of this book was written for the first time in Greek. This may be inferred from xvi. 10. And 1 i. 15, a name (i.e. Adam) from the four substances: the East, the West, the North and the South. Thus Adam's name is here derived from the initial letters of the four quarters: ἀναρ, δόξ, δερ, μηνυβα. This derivation is impossible in Semitic. This context is found elsewhere in the Sibyllines iii. 24 sqq. and other Greek writings. (2) Again our author uses the chronology of the Septuagint and in 1, 14 follows the Septuagint text of Deuteronomy xxxii. 35 against the Hebrew. On the other hand, some
sections may wholly or in part go back to Hebrew originals. There is a Hebrew Book of Enoch attributed to R. Ishmael ben Eliahu who lived at the close of the 1st century and the beginning of the 2nd century B.C. This book is very closely related to the Book of the Secrets of Enoch, or rather, to a large extent dependent upon it. Did Ishmael ben Eliahu use the Book of the Secrets of Enoch in its Greek form, or did he find portions of it in Hebrew? At all events, extensive quotations from a Book of Enoch form the basis of the rabbinical literature of the middle ages, and the provenance of these has not yet been determined. See Jewish Encyc. l. 576 seq.

But there is a stronger argument for a Hebrew original of certain sections to be found in the fact that the Testaments of the XII. Patriarchs appears to quote xxxiv. 2, 3 of our author in T. Napth. iv. 1, T. Benj. ix.

The book in its present form was written in Egypt. This may be inferred (1) from the variety of speculations which it holds in common with Philo and writings of a Hellenistic character that circulated mainly in Egypt. (2) The Phoenixes are Chalkydri (ch. xii.)—monstrous serpents with the heads of crocodiles—are natural products of the Egyptian imagination. (3) The syncretistic character of the creation account (xxv.-xxvi.) betrays Egyptian elements.

Relation to Jewish and Christian Literature.—The existence of a kindred literature in Neo-Hebrew has been already pointed out. We might note besides that it is quoted in the Book of Act Ben and Eve, the Apocalypse of Moses, the Apocalypse of Paul, the anonymous work De montibus Sinai et Sion, the Sibylline Oracles ii. 75, Origen, De principi. i. 3. 2. The authors of the Ascension of Isaiah, the Apoc. of Baruch and the Epistle of Barnabas were probably acquainted with it. In the New Testament the similarity of matter and diction is sufficiently strong to establish a close connexion, if not a literary dependence. Thus with Matt. v. 9, "Blessed are the peacemakers," cf. lxxi. 13, "Blessed is he who establishes peace." With Matt. v. 34, 35, 37, "Swear not at all," cf. xlix. 1, "I will not swear by a single oath, neither by heaven, nor by earth, nor by any other creature which God made—if there is no truth in man, let them swear by a word yea, yea, or nay, nay."

Date and Authorship.—The book was probably written between 30 B.C. and A.D. 70. It was written after 30 B.C., for it makes use of Sirach, the (Ethiopic) Book of Enoch and the Book of Wisdom. It was written before A.D. 70; for the temple is still standing; see lxx. 2.

The author was an orthodox Hellenistic Jew who lived in Egypt. He believed in the value of sacrifices (xlii. 6; lxxi. 1, 2, &c.), but is careful to enforce enlightened views regarding them (xlv. 3, 4; lxxi. 4, 5) in the law, lxxi. 8, 9; in a blessed immortality, l. 2; lxxvi. 6, 8-10, in which the righteous should be clothed in "the raiment of God's glory," xliii. 8. In questions relating to cosmology, sin, death, &c., he is an eclectic, and allows himself the most unrestricted freedom, and readily incorporates Platonic (xxxix. 16), Egyptian (xxix. 2) and Zend (lviii. 4-6) elements into his system of thought.

Anthropological Views.—All the souls of men were created before the foundation of the world (xxxii. 5) and likewise their future abodes in heaven or hell (xxii. 2, lviii. 3). Man's name was derived, as we have already seen, from the four quarters of the world, and his body was compounded from seven substances (and. 10). He was created originally good: freewill was bestowed upon him with instruction in the two ways of light and darkness, and then he was left to mould his own destiny (xxxix. 15). But his preferences through the bias of the flesh took an evil direction, and death followed as the wages of sin (xxx. 16).

ENOMOTO, BUZO, VISCOUNT (1839-1900), Japanese vice-admiral, was born in Tokyo. He was the first officer sent by the Tokugawa government to study naval science in Europe, and after going through a course of instruction in Holland he returned in command of the frigate "Kaiyo Maru," built at Amsterdam to order of the Yedo administration. The salient episode of his career was an attempt to establish a republic at Hakodate. Finding himself in command of a squadron which represented practically the whole of Japan's naval forces, he refused to acquiesce in the deposition of the Shōgun, his liege lord, and, steaming off to Yezo (1867), proclaimed a republic and fortified Hakodate. But he was soon compelled to surrender. The newly organized government of the empire, however, instead of inflicting the death penalty on him and his principal followers, as would have been the inevitable sequel of such a drama in previous times, punished them with imprisonment only, and four years after the Hakodate episode, Enomoto received an important post in Hokkaido, the very scene of his wild attempt. Subsequently (1874), as his country's representative in St Petersburg, he concluded the treaty by which Japan exchanged the southern half of Sakhalen for the Kuriles. He received the title of viscount in 1885, and afterwards held the portfolios of communications, education and foreign affairs. He died at Tokyo in 1909.

ENOS (anc. Aenomos), a town of European Turkey, in the vilayet of Adrianople; on the southern shore of the river Maritsa, where its estuary broadens to meet the Aegean Sea in the Gulf of Enos. Pop. (1905) about 8000. Enos occupies a ridge of rock surrounded by broad stretches of marshes. It is the seat of a Greek bishop, and the population is mainly Greek. It long possessed a valuable export trade, owing to its position at the mouth of the Maritsa, the great natural waterway from Adrianople to the sea. But its commerce has declined, owing to the unhealthiness of its climate, to the accumulation of sandbanks in its harbour, which now only admits small coasters and fishing-vessels, and to the rivalry of Dédéagach, a neighbouring seaport connected with Adrianople by road.

ENRIQUEZ GOMEZ, ANTONIO (c. 1601-c. 1661), Spanish dramatist, poet and novelist of Portuguese-Jewish origin, was known in the early part of his career as Enriquez de Enriz. Born at Segovia, he entered the army, obtained a captaincy, was suspected of heresy, fled to France about 1636, assumed the name of Antonio Enriquez Gomez, and became major-domo to Louis XIII., to whom he dedicated Luis dado de Diosa y de la (París, 1645). Some twelve years later he removed to Amsterdam, avowed his conversion to Judaism, and was burned in effigy at Seville on the 14th of April 1660. He is supposed to have returned to France, and to have died there in the following year. Three of his plays, El Gran Cardenal de España, don Gil de Albornos, and the two parts of Farnam Mendes Pinto were received with great applause at Madrid about 1629; in 1635 he contributed a sonnet to Montalban's collection of pastoral panegyrics on Lope de Vega, to whose dramatic school Enriquez Gomez belonged. The Academias morales de las Musas, consisting of four plays (including A lo que obliga el honor, which recalls Calderon's Médico de su honra), was published at Bordeaux in 1643; La Torre de Babilonia, containing the two parts of Farnam Mendes Pinto, appeared at Rouen in 1647; and in the preface to his poem, El Samson Nasareno (Rouen, 1656), Enriquez Gomez gives the titles of sixteen other plays likewise ascribed to Seville. There is no foundation for the theory that he wrote the plays ascribed to Fernando de Zárate. His dramatic works, though effective on the stage, are disfigured by extravagant incidents and preciosity of diction. The latter defect is likewise observable in the mingled prose and verse of La Culpa del primer peregrino (Rouen, 1644) and the dialogues entitled Política Anglica (Rouen, 1647). Enriquez Gomez is best represented by El Siglo Pitagórico y Vida de don Gregorio Guadix (Rouen, 1644), a striking picaresque novel in prose and verse, which is still regarded as a classic.

ENSCHENDE, a town in the province of Overysel, Holland, near the Prussian frontier, and a junction station 5 m. by rail S.E. of Hengelo. Pop. (1900) 23,141. It is important as the centre of the flourishing cotton-spinning and weaving industries of the Twente district; while by the railway via Gronau and
Koesfeld to Dortmund it is in direct communication with the Westphalian coalfields. Enschede possesses several churches, an industrial trade school, and a large park intended for the benefit of the working classes. About two-thirds of the town was burnt down in 1862.

**ENSENADA, CNON DE SOMODEVILLA, MARQUES DE LA** (1702–1781), Spanish statesman, was born at Alesanco near Logroño on the 2nd of June 1702. When he had risen to high office, it was said of him that his pedigree was distinguished, but nothing is known of his parents—Francisco de Somodevilla and his wife Francisca de Bengoechea,—nor is anything known of his own life before he entered the civil administration of the Spanish navy as a clerk in 1720. He served in administrative capacities at the relief of Ceuta in that year and in the reoccupation of Oran in 1737. His ability was recognized by Don Jose Patiño, the chief minister of King Philip V. Somodevilla was much employed during the various expeditions undertaken by the Spanish government to put the king's sons by his second marriage with Elizabeth Farnese, Charles and Philip, on the thrones of Naples and Parma. In 1736 Charles, afterwards King Charles III. of Spain, conferred on him the Neapolitan title of Marques de la Ensenada. The name can be resolved into the three Spanish words "en se nada," meaning "in himself nothing." The courtly flattery of the time, and the envy of the nobles who disliked the rise of men of Ensenada's class, were employed to play on words; en Ensenada is, however, a roadstead or small bay. In 1742 he became secretary of state and war to Philip, duke of Parma. In the following year (11th of April 1743), on the death of Patiño's successor Campillo, he was chosen by Philip V. as minister of finance, war, the navy and the Indies (i.e. the Colonies). Ensenada met the nomination with a becoming **solo episcopari**, professing that he was incapable of filling the four posts at once. His reluctance was overborne by the king, and he became in fact prime minister at the age of forty-one. During the remainder of the king's reign, which lasted till the 11th of July 1746, and under his successor Ferdinand VI. until 1754, Ensenada was the effective prime minister. His administration is notable in Spanish history for the vigour of his policy of internal reform. The reports on the finances and general condition of the country, which he drew up for the new king on his accession, and again after peace was made with England at Aix-la-Chapelle on the 18th of October 1748, are very able and clear-sighted. Under his direction the despoticism of the Bourbon kings became paternal. Public works were undertaken, shipping was encouraged, trade was fostered, numbers of young Spaniards were sent abroad for education. Many of them abused their opportunity, but on the whole the prosperity of the country revived, and the way was cleared for the more sweeping innovations of the following reign. Ensenada was a strong partisan of the French alliance and of a policy hostile to England. Sir B. Keene, the English minister, supported the Spanish court party opposed to him, and succeeded in preventing him from adding the foreign office to others which he held. Ensenada would probably have fallen sooner but for the support he received from the Portuguese queen, Barbara. In 1754 he offended her by opposing an exchange of Spanish and Portuguese colonial possessions in America which she favoured. On the 20th of July he was arrested by the king and sentenced to go into mild confinement at Granada, which he was afterwards allowed to exchange for Puerto de Santa Maria. On the accession of Charles III. in 1759, he was released from arrest and allowed to return to Madrid. The new king named him as member of a commission appointed to reform the system of taxation. Ensenada could not renounce the hope of again becoming minister, and entered into intrigues which offended the king. On the 18th of April 1766 he was again exiled from court and ordered to go to Medina del Campo. He had no further share in public life, and died on the 2nd of December 1781. Ensenada acquired wealth in office, but he was never accused of corruption. Though, like most of his countrymen, he suffered from the manía for grandeur, and was too fond of imposing schemes out of all proportion with the resources of the state, he was undeniably an able and patriotic man, whose administration was beneficial to Spain.

For his administration see W. Coxe, *Memoirs of the Kings of Spain of the House of Bourbon* (London, 1815), but the only complete account of Ensenada is by Don Antonio Rodríguez Villa, *Don Canón de Somodevilla, Marqués de la Ensenada* (Madrid, 1876). (D. H.)

**ENSIGN** (through the Fr. *en seigne* from the Latin plural *i* of *iugum* and *tornum*, emblem or badge such as symbols of office, or in heraldry, the ornament such as the crown, coronet or mitre borne above the charge or arms. The word is more particularly used of a military or naval standard or banner. In the British navy, ensign has a specific meaning, and is the name of a flag having a red, white or blue ground, with the Union Jack in the upper corner next the staff. The white ensign (which is sometimes further distinguished by having the St George's Cross quartered upon it) is only used in the royal navy and the royal yacht squadron, while the blue and red ensigns are the badges of the naval reserve, some privileged companies, and the merchant service respectively (see FTAO). Until 1871 the lowest grade of commissioned officers in infantry regiments of the British army had the title of ensign (now replaced by that of second lieutenant). It is the duty of the officers of this rank to carry the colours of the regiment (see COLOURS, MILITARY). In the 16th century ensign was corrupted into "en sigilum," and used in the two senses of a banner and the bearer of the banner. In the United States navy, the title ensign superseded in 1863 that of *passed midshipman*. It designates an officer ranking with second lieutenant in the army.

**ENSILAGE**, the process of preserving green food for cattle in an undried condition in a silo (from Gr. *sýbos*, Lat. *sírus*, a pit for holding grain), i.e. a pit, an erection above ground, or stack, from which air has been as far as possible excluded. The fodder which is the result of the process is called silage. In various parts of Germany a method of preserving green fodder precisely similar to that used in the case of *saucerbröw* has prevailed for upwards of a century. Special attention was first directed to the practice of ensilage by a French agriculturist, Auguste Goffart of the district of Sologne, near Orleans, who in 1877 published a work (*Manuel de la culture et de l'ensilage des moëts et autres fourragers variés*) detailing the experiences of many years in preserving green crops in silos. An English translation of Goffart's book by J. B. Brown was published in New York in 1879, and, as various experiments had been previously made in the United States in the way of preserving green crops in pits, Goffart's experience attracted considerable attention. The conditions of American dairy farming proved eminently suitable for the ensiling of green maize fodder; and the success of the method was soon indisputably demonstrated among the New England farmers. The favourable results obtained in America led to much discussion and to the introduction of the system in the United Kingdom, where, with different conditions, success has been more qualified. It has been abundantly proved that ensilage forms a wholesome and nutritious food for cattle. It can be substituted for root crops with advantage, because it is succulent and digestible; milk resulting from it is good in quality and taste; it can be secured largely irrespective of weather; it carries over grass periods of great abundance and waste to times when none would otherwise be available; and a larger number of cattle can be supported on a given area by the use of ensilage than is possible by the use of green crops. Early silos were made of stone or concrete either above or below ground, but it is recognized that air may be sufficiently excluded in a tightly pressed stack, though in this case a few inches of the fodder round the sides is generally useless owing to mildew. In America round erections made of wood and 35 or 40 ft. in depth are most commonly used. The crops suitable for ensilage are the ordinary grasses, clovers, lucerne, vetches, oats, rye and maize, the latter being the most important silage crop in America; various weeds may also be stored in silos with good results, notably spurrey (*Spergula arvensis*), a most troublesome plant in poor light soils. As a rule the crop should be mown
when in full flower, and deposited in the silo on the day of its cutting. Late is cut a few days before it is ripe and is filled in the silo. Fair, dry weather is not essential; but it is found that when moisture, natural and extraneous, exceeds 75% of the whole, good results are not obtained. The material is spread in uniform layers over the floor of the silo, and closely packed and trodden down. If possible, not more than a foot or two should be added daily, so as to allow the mass to settle down closely, and to heat uniformly throughout. When the silo is filled or the stack built, a layer of straw or some other dry porous substance may be spread over the surface. In the silo the pressure of the material, when chaffed, excludes air from all but the top layer; in the case of the stack extra pressure is applied by means of planks or other weighty objects in order to prevent excessive heating.

The closeness with which the fodder is packed determines the nature of the resulting silage by regulating the chemical changes which occur in the stack. When closely packed, the supply of oxygen is limited; and the attendant acid fermentation brings about the decomposition of the carbohydrates present into acetic, butyric and lactic acids. This product is named "sour silage." If, on the other hand, the fodder is unchaffed and loosely packed, or the silo be built gradually, oxidation proceeds more rapidly and the temperature rises; if the mass be compressed when the temperature is 140°-160°F., the action ceases and "sweet silage" results. The nitrogenous ingredients of the fodder also suffer change: in making sour silage as much as one-third of the albuminoids may be converted into ammonia; in less proportion, but in less digestible form, soured silage is still less proportion is changed, but it becomes less digestible. In extreme cases, sour silage acquires a most disagreeable odour. On the other hand it keeps better than sweet silage when removed from the silo.

ENSTATITE, a rock-forming mineral belonging to the group of orthorhombic pyroxenes. It is a magnesium metasilicate, MgSiO₃, often with a little iron replacing the magnesium; as the iron increases in amount there is a transition to diopside (q.v.), and with still more iron to hypersthene (q.v.). Bronzite and hypersthene were known long before enstatite, which was first described by G. A. Kennett in 1855, and named from bovarī, "an opponent," because the mineral is almost insusible before the blowpipe: the material he described consisted of imperfect prismatic crystals, previously thought to be scapolite, from the serpentines of Mount Zdjmar near Schönberg in Moravia. Coarse, porphyritic, perfect for architectural measurement were found in the meteorite which fell at Breitenbach in the Erzgebirge, Bohemia. Large crystals, a foot in length and mostly altered to steatite, were found in 1874 in the apatite veins traversing mica-schist and hornblende-schist at the apatite mine of Kőrrestad, near Brevig in southern Norway. Isolated crystals are of rare occurrence, the mineral being usually found as an essential constituent of igneous rocks; either as irregular masses in plutonic rocks (norite, peridotite, pyroxenite, &c.) and the serpentines which have resulted by their alteration as small idiomorphic crystals in volcanic rocks (trachyte, andesite). It is also a common constituent of meteoric stones, forming with olivine the bulk of the material: here it often forms small spherical masses, or chondrules, with an internal radiated structure.

Enstatite and the other orthorhombic pyroxenes are distinguished from those of the monoclinic series by their optical characters, viz. straight extinction, much weaker double refraction and stronger pleochroism: they have prismatic cleavages (with an angle of 88° 16') as well as planes of parting parallel to the planes of symmetry in the prism-zone. Enstatite is white, greenish or brown in colour; its hardness is 5½, and sp. gr. 3.2-3.3. (L. J. S.)

ENTABLATURE (Lat. in, and tabula, a tablet), the architectural term for the superstructure carried by the columns in the classic orders (q.v.). It usually consists of three members, the architrave (the supporting member carried from column to column, pier or wall); the frieze (the decorative member); and the cornice (the projecting and protective member). Sometimes the frieze is omitted, as in the entablature of the portico of the Caryatides of the Erechtheum. There is every reason to believe that the frieze did not exist in the archaic temple of Diana at Ephesus; and it is not found in the Lycian tombs, which are reproductions in the rock of timber structures based on early Ionian work.

ENTADA, in botany, a woody climbing belonging to the family Leguminosae and common throughout the tropics. The best-known species is Entada scandens, the sword-bean, so called from the large wooden sword-shaped bracts or "beams." The seeds are often made into snuff-boxes or match-boxes, and a preparation from the kernel is used as a drug by the natives in India. The seeds will float for a long time in water, and are often thrown up on the north-western coasts of Europe, having been carried by the Gulf-stream from the West Indies; they retain their vitality, and under favourable conditions will germinate. Linnaeus records the germination of a seed on the coast of Norway.

ENTAIL (from Fr. taille, to cut; the old derivation from tales haeredes is now abandoned), in law, a limited form of succession (q.v.). In architecture, the term "entail" denotes an ornamental device sunk in the ground of stone or brass, and subsequently filled in with marble, mosaic or enamel.

ENTASIS (from Gr. ἐντασις, to stretch a line or bend a bow), in architecture, the increment given to the column (q.v.), to counteract the optical illusion which produces an apparent hollowness in an extended straight line. It was referred to by Vitruvius (iii, 3), and was first noticed in the columns of the Doric orders in Greek temples by Allason in 1814, and afterwards measured and verified by Penrose. It varies in different temples, and is not found in some: it is most pronounced in the temple of Jupiter Olympius, most delicate in the Erechtheum. The entasis is almost invariably introduced in the spires of English churches.

ENTERITES (Gr. ἐντέρος, intestine), a general medical term for inflammation of the bowels. According to the anatomical part specially attacked, it is subdivided into duodenitis, jejunitis, ileitis, typhilitis, appendicitis, colitis, proctitis. The chief symptom is diarrhoea. The term "enteric fever" has recently come into use instead of "typhoid" for the latter disease; but see Typhoid Fever.

ENTHUSIASM, a word originally meaning inspiration by a divine aëlius or by the presence of a god. The Gr. ἐνθυσώμας is the same as the word ἐνθυσόμαι, to be filled, possessed by a god (θεός). Applied by the Greeks to manifestations of divine "possession" by Apollo, as in the case of the Pythia, or by Dionysus, as in the case of the Bacchantes and Maenads, it was also used in a transferred or figurative sense; thus Socrates speaks of the inspiration of poets as a form of enthusiasm (Plato, Apol. Soc. 22 c). Its uses, in a religious sense, are confused to an exaggerated or wrongful belief in religious inspiration, or to intense religious fervour or emotion. Thus a Syrian sect of the 4th century was known as "the Enthusiasts"; they believed that by perpetual prayer, ascetic practices and contemplation, man could become inspired by the Holy Spirit, in spite of the ruling evil spirit, which the fall had given to him. From their belief in the efficacy of prayer (εὐγνωμία), they were also known as Euchites. In ordinary usage, "enthusiasm" has lost its peculiar religious significance, and means a whole-hearted devotion to an ideal, cause, study or pursuit; sometimes, in a depreciatory sense, it implies a devotion which is partisan and is blind to difficulties and objections. (See further Inspiration, for a comparison of the religious meanings of "enthusiasm," "ecstasy" and "fanaticism.")

ENTHYMEME (Gr. ἐνθυμέμα, in formal logic, the technical name of a syllogistic argument which is incompletely stated. Any one of the premises may be omitted, but in general it is that one which is most obvious or most naturally present to the mind. In point of fact the full formal statement of a syllogism is rare, especially in rhetorical language, when the deliberate omission of one of the premises has a dramatic effect. The
suppression of the conclusion may have the effect of emphasizing the idea which necessarily follows from the premises. Far commoner is the omission of one of the premises which is either too clear to need statement or of a character which makes its omission desirable. A famous instance quoted in the Port Royal Logic, pt. iii. ch. xiv., is Medea's remark to Jason in Ovid's Medea, "Servare potui, perdere an possim rogas?" where the major premise is "Qui servare potuit, perdere posse potuit" is its author's.

This use of the word entomology differs from Aristotle's original application of it to a syllogism based on probabilities or signs (ἐντομος ἤ ιματοσ), i.e. on propositions which are generally valid (ἐλεκτρα) or on particular facts which may be held to justify a general principle or another particular fact (Anal. prior. β xxvii. 70 a 10).

See beside text-books on logic, Sir W. Hamilton's Discussions (1847); Mansel's ed. of Aldrich, Appendix F; H W B. Joseph, Intro. to Logic, chap. xvi.

ENTOMOLOGY (Gr. ἐντόμα, insects, and ἄγος, a discourse), the science that treats of insects, i.e. of the animals included in the class Hexapoda of the great phylum (or sub-phylum) Arthropoda. The term, however, is somewhat elastic in its current use, and students of centipedes and spiders are often reckoned among the entomologists. As the number of species of insects is believed to exceed that of all other animals taken together, it is no wonder that this study should form a special division of zoology with a distinctive name.

Beetles (Scarabaei) are the subjects of some of the oldest sculptured works of the Egyptians, and references to locusts, bees and ants are familiar to all readers of the Hebrew scriptures. The interest of insects to the eastern races was, however, economic, religious or moral. The science of insects began with Aristotle, who included in a class "Entoma" the true insects, the arachnids and the myriapods, the Crustacea forming another class ("insecta tracra") of the "Anrema" or "bloodless animals." For nearly 2000 years the few writers who dealt with zoological subjects followed Aristotle's leading.

In the history of the science, various lines of progress have to be traced. While some observers have studied in detail the structure and life-history of a few selected types (insect anatomy and development), others have made a more superficial examination of large series of insects to classify them and determine their relationships (systematic entomology), while others again have investigated the habits and life-relations of insects (insect biomics). During recent years the study of fossil insects (palaeoentomology) has attracted much attention.

The foundations of modern entomology were laid by a series of wonderful memoirs on anatomy and development published in the 17th and 18th centuries. Of these the most famous are M. Malpighi's treatise on the silkworm (1669) and J. Swammerdam's insects, issued in 1737. Fifty years after its author's death, and containing observations on the structure and life-history of a series of insect types, Aristotle and Harvey (De generatione animalium, 1651) had considered the insect larva as a prematurely hatched embryo and the pupa as a second egg. Swammerdam, however, showed the presence under the larval cuticle of the pupal structures. His only unfortunate contribution to entomology—indeed to zoology generally—was his theory of growth, which taught the existence within the egg of a perfectly formed but miniature adult. A year before Malpighi's great work appeared, another Italian naturalist, F. Redi, had disproved by experiment the spontaneous generation of maggots from putrid flesh, and had shown that they can only develop from the eggs of flies.

Meanwhile the English naturalist, John Ray, was studying the classification of animals; he published, in 1705, his Methodus Insectorum, in which the nature of the metamorphosis received due weight. Ray's "Insects" comprised the Arachnids, Crustacea, Myriapoda and Annelida, in addition to the Hexapods. Ray was the first to formulate that definite conception of the species which was adopted by Linnaeus and emphasized by his binomial nomenclature. In 1735 appeared the first edition of the Systema naturae of Linnaeus, in which the "Insecta" form a group equivalent to the Arthropoda of modern zoologists, and are divided into seven orders, whose names—Coleoptera, Diptera, Lepidoptera, &c., founded on the nature of the wings—have become firmly established. The fascinating subjects of insect biomics and life-history were dealt with in the classical memoirs (1754-1742) of the Frenchman R. A. F. de Réamur, and (1752-1758) of the Swede C. de Geer. The freshness, the air of leisure, the enthusiasm of discovery that mark the work of these old writers has not been equalled by the more systematic zoologist, who at times feels burdened with the accumulated knowledge of a century and a half. From the end of the 18th century until the present day, it is only possible to enumerate the outstanding features in the progress of entomology. In the realm of classification, the work of Linnaeus was continued in Denmark by J. C. Fabricius (Systema entomologica, 1775), and extended in France by G. P. B. Lamarck (Animalc sans verites, 1801) and G. Cuvier (Lecons d'anatomie comparée, 1800-1803), and in England by W. E. Leach (Trans. Linn. Soc. xi., 1815). These three authors definitely separated the Arachnids, Crustacea and Myriapoda as classes distinct from the Insects (see HEXAPODA).

The work of J. O. Westwood (Modern Classification of Insects, 1839-1840) connects these older writers with their successors of to-day.

In the anatomical field the work of Malpighi and Swammerdam was first continued most energetically by French specialists. P. Lycot had published in 1760 his elaborate monograph on the goats-moth caterpillar, and H. E. Strauss-Dürckheim in 1828 issued his great treatise on the cockchafer. But the name of J. C. L. de Savigny, who (Mém. sur les animaux sans verites, 1816) established the homology of the jaws of all insects whether biting or sucking, deserves especial honour. Many anatomical and developmental details were carefully worked out by L. Dubour (in a long series of memoirs from 1811 to 1860) in France, by G. Newport ("Insecta" in Encyc. Anat. and Physiol., 1839) in England, and by H. Burmeister (Handbuch der Entomologie, 1832) in Germany. Through the 19th century, as knowledge increased, the work of investigation became necessarily more and more specialized. Anatomists like F. Leydig, F. Müller, B. T. Lowe and V. Graber turned their attention to the detailed investigation of some one species or to special points in the structure of some particular organs, using for the elucidation of their subject the ever-improving microscopic methods of research.

Societies for the discussion and publication of papers on entomology were naturally established as the number of students increased. The Société Entomologique de France was founded in 1832, the Entomological Society of London in 1834. Few branches of zoology have been more valuable as a meeting-ground for professional and amateur naturalists than entomology, and not seldom as in the case of Westwood, developed into a professor. During the pre-Linnean period, the beauty of insects—especially the Lepidoptera—had attracted a number of collectors; and these "Aurelians"—regarded as harmless lunatics by most of their friends—were the forerunners of the systematic students of later times. While the insect fauna of European countries was investigated by local naturalists, the spread of geographical exploration brought ever-increasing stores of new material to the great museums, and specialization—either in the fauna of a small district or in the world-wide study of an order or a group of families—became constantly more marked in systematic work. As examples may be instanced the studies of A. H. Haliday and H. Loew on the European Diptera, of John Curtis on British insects, of H. T. Stainton and O. Staudinger on the European Lepidoptera, of R. M'Callan on the European and of H. A. Hagen on the North American Neuroptera, of D. Sharp on the Syntomidae and other families of Coleoptera of the whole world.

The embryology of insects is entirely a study of the last century. C. Bonnet indeed observed in 1745 the virgin-reproduction of Aphids, but it was not until 1842 that R. A. von Kölliker described the formation of the blastoderm in the egg of the midge Chromatopus. Later A. Weismann (1863-1864)
traced details of the growth of embryo and of pupa among the Diptera, and A. Kovalevsky in 1871 first described the formation of the ootheca, developed in insects. Most of the recent work on the embryology of insects has been done in Germany or the United States, and among numerous students V. Graber, K. Heider, W. M. Wheeler and R. Heymons may be especially mentioned. The work of de Réamur and de Geer on the bionomics and life history of insects has been continued by numerous observers, among whom may be especially mentioned in France J. H. Fabre and C. Janet, in England W. Kirby and W. Spence, J. Lubbock (Lord Avebury) and L. C. Miall, and in the United States C. V. Riley. The last-named may be considered the founder of the strong company of entomological workers now labouring in America. Though Riley was especially interested in the bearings of insect life on agriculture and industry—economic entomology (q. v.)—he and his followers have laid the science generally under a deep obligation by their researches.

After the publication of C. Darwin's Origin of Species (1859) a fresh impetus was given to entomology as to all branches of zoology, and it became generally recognized that insects form a group convenient and helpful for the elucidation of certain problems of animal evolution. The writings of Darwin himself and of A. R. Wallace (both at the time active entomological collectors) contain much evidence drawn from insects in favour of descent with modification. The phylogeny of insects has since become a subject of special interest to Brauer, H. Walckenaer and many others, the study of mimicry and allied problems by H. W. Bates, F. Müller, E. B. Poulton and M. C. Piepers; the bearing of insect habits on theories of selection and use-inheritance by A. Weismann, G. W. and E. Peckham, G. H. T. Eimer and Herbert Spencer; variation by W. Bateson and M. Standfuss.

BIBLIOGRAPHY.—References to the works of the above authors, and to many others, will be found under HEXAPODA and the special articles on various insect orders. Valuable summaries of the labours of Malpighi, Swammerdam and other early entomologists are given in L. C. Denny's Cockroaches (London, 1878), and L. Henneugy's Les Insectes (Paris, 1904).

ENTOMOSTRACA. This zoological term, as now restricted, includes the Branchiopoda, Ostracoda and Copepoda. The Ostracoda have the body enclosed in a bivalve shell-covering, and normally unsegmented. The Branchiopoda have a very variable number of body-segments, with or without a shield, simple or bivalved, and some of the postoral appendages normally branchial. The Copepoda have normally a segmented body, not enclosed in a bivalved shell-covering, the segments not exceeding eleven, the limbs not branchial. Under the heading CRUSTACEA the Entomostroidea have already been distinguished not only from the Thryostroidea but also from the Malacostracae, and an intermediate group of which the true position is still disputed. The choice is open to maintain the Leptostenoidea as independent orders, or to follow in it the Leptostraca, or to introduce it among the Malacostraca as the Nebaliacea, or with Packard and Sars to make it an entomostroidea subdivision under the title Phyllo- cardia. At present it comprises the single family Nebaliidae. The bivalved carapace has a jointed rostrum, and covers only the front part of the body, to which it is only attached quite in front, the valve-like sides being under control of an adductor muscle. The eyes are stalked and movable. The first antennae have a lamellar appendage at the end of the peduncle, a decided non-entomostracan feature. The second antennae, mandibles and two pairs of maxillae may also be claimed as of malacostracan type. To these succeed eight pairs of foliaceous branchial appendages on the front division of the body, followed on the hind division by four pairs of powerful bifurcate swimming feet and two rudimentary pairs, the number, though not the nature, of these appendages being malacostracan. On the other hand, the two limbless segments that precede the caudal furca are definitely non-malacostracan. The family was long limited to the single genus Nebalia (Leach), and the single species N. hippus (O. Fabricius). Recently Sars has added a Norwegian species, N. typiklophus, not blind but weak-eyed. There are also now two more genera, Paramebalia (Claus, 1885), in which the branchial feet are much longer than in Nebalia, and Nebaliopsis (Sars, 1887), in which they are much shorter. All the species are marine.

Branchiopoda.—In this order, exclusion of the Phyllocarida will leave three suborders of very unequal extent, the Phyllopoda, Cladocera, Branchiura. The constituents of the last have often been classed as Copepoda, and among the Branchiopoda must be regarded as aberrant, since the "branchial tail" implied in the name is absent, the foot, and the actual feet are by no means obviously branchial.

Phyllopoda.—This "leaf-footed" suborder has the appendages which follow the second maxillae variable in number, but all foliaceous and branchial. The development begins with a free nauplius stage. In the outward appearance of the adults there is great want of uniformity, one set having their limbs sheltered by no carapace, another having a broad shield over most of the body, and a third having a more pointed shield giving birth to winged and many other phyllopods, and in turn "millions of them perish by the drying up of the pools in July" (Packard). The remaining family, the Branchiopodidae, includes eight genera. In the long familiar Branchipus, Chirocephalus and Stereopleocephalus the males have frontal appendages, but these are wanting in the "brine shrimp" Artemia, and the same want helps to distinguish Branchipotidae (Verrill, 1869) from the genus Branchipus. Of the Branchiopodidae (Sars, 1897) the male is not yet known, but in his genera of the same date, the Siberian Artemiopsis and the South African Branchipodopsis (1898), there are frontal appendages. Of the genus the male belongs to Cape Colony, but the specimens described were born and bred in observed in Norway. For the study of fresh water Entomostroidea new possibilities are now opening up to the naturalist. A small group was dried mud, coming for example from Pennsylvania, and after an indefinite interval of time put into water in England or elsewhere, may yield him living forms, both new and old, in the most agreeable variety. Some caution should be used against confusing accidentally introduced indigenous species with those reared from the imported eggs. Those, too, who send or bring the forms, should exercise a little thought in the choice of it, since dry earth that has never had any Entomostracae near it at home will not become fertile in them by the mere fact of exportation.

2. Notopoda.—In this division the body is partly covered by a broad shield, the hind part may be a true carapace, but the first antennae are small, the second rudimentary or wanting; of the numerous feet, sometimes sixty-three pairs, exceeding the number of segments to which they are attached, the first pair are more or less unlike the rest, and in the female the eleventhe have the epipod and exopod (flagellum and sub-apical lobe of Lankester) modified to form an ovipositor.

Development begins with a nauplius stage. Males are very rare. The single family Apusidae contains only two genera, Apus and its near neighbour Lepadurus. Apus australiensis (Spencer and Hall, 1896) may rank as the largest Entomostraca, reaching in the male, from front of shield to end of telson, a length of 70 mm., in the female of 64 mm. In a few days, or at most a fortnight, after a rainfall numberless specimens of these sires were found swimming about, and as not a single one was to be found in the water-pools prior to the rain, these must have been developed from the egg. Similarly, in Northern India, Apus himalayensis was "collected from a stagnant pool in a jungle four days after a shower of rain had fallen," following a drought of four months (Packard).
3. Conchophila.—Though concealed within the bivalved shell-cover, the mouth-parts are nearly as in the Gymnothora, but the flexing of the caudal part is in contrast, and the biramous second antennae correspond with what is only a larval character in the other. The male that meets two females is modified into grasping organs. The small ova are crowded beneath the dorsal part of the valves. The development usually begins in water, though sometimes in the air. They are found in the following families: (a) The Limnadiidae, with feet from 18 to 32 pairs, comprise four (or five) genera. Of these Limnadiella (Girard, 1855) has a single eye. It remains rather obscure, though the type species occurs in the eastern part of the Malay Peninsula. The genus Limnadia (Bronngränt, 1826) has little room to consist of species essentially parthenogenetic. But when asked to produce a young, however unusual and happens to be the enormous, he has no difficulty in showing how hard it is to prove a negative. (b) The Lyncidae, with not more than twelve pairs of feet. This family is limited to the species, widely distributed, of the single genus Lymnaea, established by O. F. Müller in 1776 and 1781, and first restricted by Leach in 1816 in the Encyclopaedia Britannica (art. "Annuola," of that edition). Leach assigns to it the single species L. brachyurus (Müller), and as this is included in the genus Lymnaea (Löven, 1846), that genus must be a synonym of Lymnaea as restricted. (c) Lepidesthesidae. Esteria (Rüppell, 1837) was instituted for the species dasilacensia, which Sars includes in his genus Lepidesthes (1898), but Sars was not notified, and of its synonyms Cyclaeus (Audouin, 1837) is lost for vagueness, while Issuria (Joly, 1842) is also so designated, so that Lepidesthes becomes the name of the type species that designates the name of the family. This family consists of the single species Cylindriconcha holsiapis (Baird), reported from India, Ceylon, Celebes, Australia, East Africa, and Brazil (1887), having been described as having its eyes from dried Australian mud, found that, unlike other phyllopods, but like the Cladoceras, the parent keeps its brood within the shell until their full development.

4. Cladocera.—In the suborder the head is more or less distinct, the rest of the body being in general laterally compressed and covered by a bivalved test. The title "branching horns" alludes to the second antennae, which are two-branched except in the families of Holopedium, with both branch setiferous, composed of only two to four joints. The mandibules are without palps. The pairs of feet are a pair to six. The eye is single, and in addition to the eye there is often an "eye-spot," Monospius being unique in having the eye-spot alone and no eye, while Legidioapis (Sars, 1901) has an eye with an eye-spot equal to it or larger. The heart has a pair of venous ostia, often blending into one, and an anterior arterial sesta. Respiration is conducted by the general surface, by the branchial lamina (external branch) of the test, and the vesicular appendage (when present) at the base of this branch. The "abdomen," behind the limbs, is usually very short, occasionally very long. The "postabdomen," marked off by the two postabdominal setae, usually has teeth or spines, and often serves as a denticle or fan-like claw, or it may be rudimentary, as in Polyphemus. Many species have a glandular organ at the back of the head, which Sida cristalina uses for attaching itself to various objects. The Leydigian or nuchal organ is supposed to be auditory and to contain an otolith. The female lays two kinds of eggs—"summer-eggs," which develop without fertilization, and "winter-eggs" or resting eggs, which require to be fertilized. The latter in the Daphniidae are enclosed in a modified part of the mother's shell, called the epipharynx from its resemblance to a saddle in shape and size. In other families a less elaborate case has been observed, for which Scourfield has proposed the term protoehippium. In Legidioapis he has recently found a structure almost as complex as that of the Daphniidae. In some families the resting eggs escape into the water without special covering. Only the embryos of Lepidiodora are known to hatch out in the nauplius stage. Penilia (Dana, 1849) is perhaps the only exclusively marine that meets a fresh-water Cladoceran. Fresh water, but their adaptability is large, since Koia rectimens (O. F. Müller) can equably enjoy a pond at Blackheath, and near Odessa live in water twice as salt as that of the ocean. In point of size a Cladoceran of 5 mm. is spoken of as colossal.

Dr. Jules Richard in his revision (1895) retains the sections proposed by Sars in 1865. Calyptraemera and Gymnomera. The former, with small mouth used or not used by the eye. H. O. Müller has divided into two tribes, the Cladopoda, or "comb-feet," in which the six pairs of similar feet, all branching and non-prehensile, are furnished with setae arranged like the teeth of a comb, and the Anomopoda, or "variety-feet," in which the front feet differ from the rest by being more or less prehensile, without branchial laminae.

The Cladopoda comprise two families: (a) the Holopediidae, with only one species. The male that meets two females is modified into grasping organs. The small ova are crowded beneath the dorsal part of the valves. The development usually begins in water, though sometimes in the air. (b) The Simidae, without such involution, but with seven genera, and rather more than twice as many species. Of Diaphanosoma modigliani Rich. says that at different points of Lake Toba in Sumatra millions of specimens were penned, among which a species of a rogest stripe, certain to be deinvolution, but with seven genera, and rather more than twice as many species. Of Diaphanosoma modigliani Rich. says that at different points of Lake Toba in Sumatra millions of specimens were penned, among which a species of a rogest stripe, certain to be deinvolution, but with seven genera, and rather more than twice as many species. Of Diaphanosoma modigliani Rich. says that at different points of Lake Toba in Sumatra millions of specimens were penned, among which a species of a rogest stripe, certain to be deinvolution, but with seven genera, and rather more than twice as many species.
"interruption parasites," because when gorged they leave their hosts, fishes or frogs, and swim about in freedom for a considerable period. The long-known Argulus (O. F. Müller) has the second maxillae transformed into suckers, but in Dolops (Audouin, 1837) (fig. 1), the name of which supersedes the more familiar Cypridina (Heller, 1857), these effect attachment by ending in strong hooks (Bouvier, 1897). A third genus, Chromedon (Thiele, 1900), has suckers, but has lost its first antennae, at least in the female.

The Podocopa.-The body, seldom in any way segmented, is wholly encased in a bivalved shell, the caudal part strongly flexed, and almost always ending in a furca. The limbs, including antennae and mouth organs, never exceed seven definite pairs. The first antennae never have more than eight joints. The young usually pass through several stages of development after leaving the egg, and this commonly after, even long after, the egg has left the maternal shell. Paethogenesis is frequent.

The four tribes instituted by Sars in 1865 were reduced to two by G. W. Müller in 1894, the Mydocopa, which almost always have a heart, and the Podocopa, which have none.

Mydocopa.—These have the furcular branches broad, lamellar, with at least three pairs of strong spines or unges. Almost always the first antennae are the only ones in the water. The tribe includes the three families, Cyprididae, Holocypridae, and the heartless Polycopidae, which constituted the tribe Cladocopa of Sars. From the first of these genera, distinguished from the others by the shape of the valves, and from the second of the number of spines which they possess, it has been named Cyprididae. The Podocopa are remarkable for seven pairs of long branchial valves which fold over the head of the animal, and the Sarsiidae, still somewhat obscure, but with the first antennae, to which is added the category, now unknown, known as the Podocopa, and the third, which are destitute of compound lateral eyes, and have the sexual orifice unsymmetrically placed.

Cyprididae.—In these the furcular branches are linear or rudimentary, the shell is without rostral spines, and, besides distinguishing characters of the second antennae, they have always a branchial plate which develops on the first maxillae, which is important in the classification of the genus. There are five families: (a) Cyprididae (including Cypridopsis of Brady and Norman). In some of the genera the fission is more or less complete, and in the British Isles it is said "until quite lately males in this genus were unknown; and up to the present time no male has been found in the British Islands." (Brady and Norman, 1896). On the other hand, the first antennae, according to the plan of calling them second maxillae in the Cypriidae (including Asterope, maxillae in the Holocypridae and Cypridina, and second maxillae in the Polycopidae, and the genus Cypridina in the Podocopa, so that in his fine monograph he uses the term first leg in two quite different senses. The first legs, meaning thereby the sixth pair of appendages, are generally pediform and locomotive, but sometimes unjointed, acting as a kind of brushes to cleanse the furca, while in the Polycopidae they are entirely wanting. The second legs are sometimes wanting, sometimes pediform and locomotive, sometimes strangely metamorphosed into the "vermiform organ," generally long, many-jointed, and distally provided with retractile spines, its function being that of an extremely mobile cleansing foot, which can in some cases do the work of the furca in the brood-space, between the branchial leaves of Arsterope (fig. 3), and even range over the external surface of the valve. The "branchial" appendages of the Podocopa are medially placed, and, in spite of their sometimes forward situation, the species are believed among other possibilities that they and the definition of the Cypridinae may be alike remnant of a third pair of legs, not homologous with the peduncles of other Ostracods (Podocopa included). The furca is, however, usually a powerful motor organ, and has its laminae edged with strong teeth (ungues) or setae or both. The valves are always of a single nauplium, though born as young, and pass through various stages to maturity. Brady and Norman, in their Monograph of the Ostracoda of the North Atlantic and Northern Europe (1896), give a bibliography of 127 titles, and in the second part (1896) they give 55 more. The lists are not meant to be exhaustive, any more than G. W. Müller's list of 125 titles (1894). They do not refer to Latreille, 1802, with whom the term Ostracoda originates.

Copepoda.—The body is not encased in a bivalved shell; its articulated segments are at most eleven, those behind the cephalic segment being without trace of limbs, but the last almost always carrying a furca. Sexes separate, fertilization by spermatophores. Ova in single or double or rarely several

---
ENTOMOSTRACA

packets, attached as osiries or egg-strings to the genital openings, or enclosed in a dorsal marsupium, or deposited singly or occasionally in groups. The teneral larval organ in the male, and both sexes, constantly tend to prove that there are no sharply dividing lines between the free-living, the semi-parasitic, and those which in adult life are wholly parasitic and then sometimes grotesquely unlike the normal standard. Giesbrecht and Hansen have shown that the mouth-organs consist of mandibles, first and second maxillae and maxillipeds; and Claus himself relinquished his long-maintained hypothesis that the last two pairs were the separated exopods and endopods of a single pair of appendages. Thouret’s classification (1859) of Gnathostoma, Pocellostoma, Siphonostoma, based on the mouth-organs, was long followed, though almost at the outset shown by Claus to depend on the erroneous supposition that the Pocellostoma were devoid of mandibles. Brady added a new section, Choniostoma, in 1894, and another, Leptostoma, in 1900, each for a single species. Canu in 1892 proposed two groups, Monopodophyla and Dipodophyla, the copulatory openings of the females being in the latter, unpaired in the former. It may be questioned whether this distinction, however important in itself, would lead to a satisfactory grouping of families. In the same year Giesbrecht proposed his division of the order into Gymnonepla and Podoplea.

In appearance an ordinary Copepod is divided into fore- and hind-body, of its eleven segments the composite first being the head, the next five constituting the thorax, and the last five the abdomen. The absence of sense organs, though frequent, is not after a little experience materially confusing the count. But there is this peculiarity, that the middle segment is sometimes continuous with the broader fore-body, sometimes with the narrow hind-body. In the former case the hind-body, consisting only of the abdomen, is a pleon or tail-part devoid of feet, and the species so constructed are Gymnonepla, those of the naked or footless pleon. In the latter case the middle segment is represented with it to the hind-body a total of the middle leg-limen, whence the term Podoplea, meaning species that have a pleon with feet. It may be objected that hereby the term pleon is used in two different senses, first applying to the abdomen alone and then to the abdomen plus the last thoracic segment. Even this verbal flaw would be obviated if Giesbrecht could prove his tentative hypothesis, that the Gymnonepla may have lost a pre-genital segment of the abdomen, and the Podoplea may have lost the last segment of the thorax. The classification is worked out as follows:

1. Gymnonepla.—First segment of hind-body footless, bearing the orifices of the genital organs (in the male unsexmatically placed); last foot of the fore-body in the male a copulatory organ; neither, or only one, of the first pair of antennae in the male geniculating; cephalic lobe usually articulated and provided with many plumose setae; heart generally present. Animals usually free-living, pelagic (Giesbrecht and Schmell).

This group, with 65 genera and four or five hundred species, is divided by Giesbrecht into tribes: (a) Amphakandria. In this tribe the males have both antennae of the first pair as sensory organs. The most important one, but one family, the Calanidae, but this is a very large one, with 20 genera and more than 100 species. Among them is the cosmopolitan Calanus finmarchicus, the earliest described (by Bishop Gunner in 1777) of all the marine free-swimming Copepoda. Also is the pelagic Plankton, Calanus plumulans (Dana), with its highly ornamented antennae and gorgeous tail, the most beautiful species of the whole order (fig. 4). (b) Heterakandria. Here the males have one or the other of the first pair of antennae modified into a grasping organ for holding the females. There are four families, the Diaptomidae with 27 genera, the Pontellidae with 10, the Paracyclopidae and Conuraeidae each with one genus. The first of these families is often called Centropagidae, but, as Sars has pointed out, Diaptomus (Westwood, 1836) is the oldest genus in it. Of 177 species validly described, 67 to Diaptomus. In regard to one of its species Dr. Brady says: "In one instance, at least (Talikn Tarn, Cumberl) I have seen the net come up from a depth of 6 or 8 ft. below the surface with a dense mass consisting almost entirely of Diaptomus." The length of this net-filling species is about a twentieth of an inch. (c) Podoplea.—The first segment of the hind-body almost always with a sensory pair of antennae; and the second pair of the organs (symmetrically placed in both sexes) in the following segment; the last foot of the body nor the rudimentary feet just mentioned acting as a copulatory organ in the male; or neither of the first pair of antennae in the male geniculating; cephalic limbs less abundantly articulated and with fewer plumose setae or none, but with hooks and clasping setae. Heart almost always wanting. (d) Free-living (rarely pelagic) or parasitic (Giesbrecht and Schmell).

This group is also divided by Giesbrecht into two tribes, Amphithrandria and Isokeraandria. In 1892 he distinguished the former tribe, in which the mouth-organs are of the free-living type, modified for holding the female, and the genital openings of the female have a ventral position, sometimes in close proximity, sometimes more remotely lateral; the different sexes differing from each other in the form of the male are similar to those of the female, the function of holding her being transferred to the male maxillipeds, while the genital openings of the female are dorsal, though at times strongly lateral. In the Isokeraandria the female has in the abdomen six times or six times more than the copepod genus. The family Thaumatothrix (Kröyer), established earlier than its synonym Thaumatocara (Kröyer), or that of the genus Monopoda is, imperfectly known. The defect of mouth-organs probably does not apply to the period of youth, which some of them spend parasitically in the body-cavity of worms (Gard, 1896). The family Podoplea, or six times or six times more than the copepod genus. Of those with the eggs surrounded by a parasitic, semi-parasitic species, the definitions, of a too hasty precision, took a different form: (a) Amphithrandria. "Swimming Podoplea with geniculating first antennae in the male sex, and descendants of such; first antennae in female and male almost always differently articulated." The families occupy fresh water as well as the sea. Naturally "descendants" which have lost the characteristic feature of the definition cannot be recognized without some further assistance than the definition supplies. Of the families comprised, the Monomorfididae consist only of Monomorfa (Canu, 1892) and Monodendrothrix (Müller, 1776), though greatly restricted since Müller’s time, still has several scores of species abundantly peopling inland waters of every kind and situation, without one that can be relied on as exclusively marine like the species of Oithona (Baird). The Monomorfididae are now limited to Misophria (Boeck). The presence of a heart in this genus helps to make it a link between the Podoplea and Gymnonepla, though in various other respects it approaches the next family. The Harpacticidae owe their name to the genus Articopsis (Milne-Edwards, 1840). Brady in 1880 assigns to this family 33 genera and 81 species. Among them are sub-families of the richly adorned Podoplea, the Capitulidae, Tachidinae, Anomamorphinae, Harpacticinae, Dyidinae, Canthocampinae (for which Canthocampinae should be read), and Monomorphyinae, among which Stenohalinidae (Brady) without distinctive characters can be described. The Aciscididae have variable characters, showing a gradual adaptation to parasitic life in Tunicates. Giesbrecht (1900) considers Canu quite right in grouping together in this single family those parasites of ascidians, simple and compound, which had been previously distributed among families with the more or less significant names Nolodaphyidae, Dorytephiidae, Buperothidae, Schistoothidae, Kinetomodidae, Enterocaridae, and Enteromastidae. Further, he includes in this family the Ectenognaths, not an ascidian, but from the intestine of the beautiful starfish Acanthos rosacea. The Asterocaridae, which have a good swimming caudal, except in the case of Cancerilla tubulata (Dalley), lead a semi-parasitic life on echinoderms, sponges, &c., inhabiting their food. Giesbrecht, displacing the older name Ascominiatidae, assigns to this family 21 genera in five subfamilies, and suggests that the long-known but still puzzling Nicolaë from the gills of the lobster might be placed in an
ENTRAGUES—ENTRE MINHO E DOURO

additional subfamily, or be made the representative of a closely related family. The Dichelostomidae, on account of their sometimes many-jointed first antennae, are referred also to this tribe by Giesbrecht. (b) Isorudaria. "Swimming Podopæa without general swimming movements; first and dwelling the mouth of several species of one antennae of male and female almost always articulated alike." To this tribe Giesbrecht assigns the families Clavigeridae, Coryxotidae, Glaucophoridae, and Eunotidae. The Eunotidae, Colpoclididae, Nereididae. Here also must for the time be placed the Calligidae, 

Philothoidae (Philothoidae of Vogt, Carus, Claus), Lernaeidae, Chondracanthidae, Sphaeroidae (better known as Chondracanthidae), and the remarkable subfamily of the Lernaeopodidae, Herpilobidae, Entomopodidae. For the distinguishing marks of all these, the number of their genera and species, their habits and 

transfers, the reader is referred to the writings of specialists. Sars (1901) proposed seven suborders—Calanoida, Harpacticoida, Cyclopoida, Notodendridae, Monistriodihi, Caligoïda, Lernaeoida.

ENTRAGUES, CATHERINE HENRIETTE DE BALZAC D' (1759-1833), marquise de Verneuil, mistress of Henry IV., king of France, was the daughter of Charles Balzac d'Entragues and of Marie Touchet, mistress of Charles IX. Ambitious and intriguing, she succeeded in inducing Henry IV. to promise to marry her after the death of Gabrielle d'Estrees, a promise which led to bitter scenes at court when shortly afterwards Henry married Marie de Medici. She carried her spite so far as to be deeply compromised in the conspiracy of Marshal Biron against the king in 1606, but escaped with a slight punishment, and in 1608 Henry actually took her back into favour again. She seems then to have been involved in the Spanish intrigues which preceded the death of the king in 1610. See H. de la Ferrière, Henri IV. le roi, l'amoureux (Paris, 1890).

ENTRECASTAUX, JOSEPH-ANTOINE BRUNI D' (1739-1793). French navigator, was born at Aix in 1739. At the age of fifteen he entered the navy. In the war of 1778 he commanded a frigate of thirty-two guns, and by his clever seamanship was successful in convoying a fleet of merchant vessels from Marseille to the Levant, although they were attacked by two pirate vessels, each of which was larger than his own ship. In 1785 he was appointed to the command of the French fleet in the East Indies, and two years later he was named governor of the Mauritius and the Isle of Bourbon. While in command of the East India fleet he made a voyage to China, an achievement which in 1790 led the French government to select him to command an expedition which it was sending out to seek some tidings of the unfortunate La Pérouse, of whom nothing had been heard since February 1788. Rear-admiral d'Entrécastaux's expedition comprised the "Recherche" and "L'Esperance," with Captain Huon de Kermadec as second in command. No tidings were obtained of the missing navigator, but in the course of his search Entrécastaux made important geographical discoveries. He traced the outlines of the eastern coast of New Holland, made extensive surveys round the Tasmanian coast, and touched at several places on the south coast of New Holland. The two ships entered Storm Bay, Tasmania, on the 21st of April 1792, and remained there until the 16th of May, surveying and naming the d'Entrécastaux Channel, the entrances to the Huon and Derwent rivers, Brunni Island, Recherche Bay, Port Esperance and various other localities. Excepting the name of the river Derwent (originally called Riviere du Nord by its French discoverers), these foregoing appellations have been retained. Leaving Tasmania the expedition sailed northward for the East Indies, and while coasting near the island of Java, Entrécastaux was attacked by scurvy and died on the 20th of July 1793.

ENTRE MINHO E DOURO (popularly called Minho), a former province of Northern Portugal; bounded on the N. by Galicia in Spain, E. by Traz-os-Montes, S. by Beira and W. by the Atlantic Ocean. Pop. (1900) 1,170,361; area 2790 sq. m. Though no longer officially recognized, the old provincial name remains in common use. The coast-line of Entre Minho e Douro is level and unbroken except by the estuaries of the main rivers; inland, the elevation gradually increases towards the north and east, where several mountain ranges mark the frontier. Of these, the most important are the Serra da Peneda (4728 ft.), between the rivers Minho and Limia; the Serra do Gerês (4357 ft.), on the Galician border; the Serra da Cabreira (4021 ft.), immediately to the south; and the Serra de Marão (4642 ft.), in the extreme south-east. As its name implies, the province is bounded by two great rivers, the Douro (g.) on the south, and the Minho (Spanish Miño) on the north; but a small tract of the province is south of the Douro, and a small tract of the Galician province is north of the Douro. The provincial boundary. There are three other large rivers which, like the Minho, flow west-south-west into the Atlantic. The Limia or Antela (Spanish Limia) rises in Galicia, and reaches the sea at Viana do Castelo; the Cavado springs from the southern foot hills of La Raya Seca, on the northern frontier of Traz-os-Montes, and forms, at its mouth, the small harbour of Espozende; and the Ave descends from its sources in the Serra da Cabreira to Guimaraes, where it enters the Atlantic. A large right-hand tributary of the Douro, the Tamega, rises in Galicia, and skirts the western slopes of the Serra de Marão.

The climate is mild, except among the mountains, and such plants as heliotrope, fuchsias, palms, and aloes thrive in the open throughout the year. Wheat and maize are grown on the plains, and other important products are wine, fruit, olives and chestnuts. Fish abound along the coast and in the main rivers; olive oil is obtained from the mountain forests, and dairy-farming and the breeding of pigs and cattle are carried on in all parts. As the province is occupied by a hardy and industrious peasantry, and the density of population (419:5 per sq. m.) is more than twice that of any other province on the Portuguese mainland, the soil is very closely cultivated. The methods and implements of the farmers are, however, most primitive, and at the beginning of the 20th century is was not unusual to see a mule, or even a woman, harnessed with the team of oxen to an old-fashioned wooden plough. Small quantities of coal, iron, anthracite, lead and gold are mined; granite and slate are quarried; and there are mineral springs at Mongão (pop. 2283) on the Minho. The Oporto-Corunna railway traverses the western districts and crosses the Spanish frontier at Tuy; its branch lines give access to Braga, Guimarães and Povo da Varzim; and the Oporto-Salamanca railway passes up the Douro valley. The greater part of the north and west can only be reached by road, and even the chief highways are ill-kept. In these regions the principal means of transport is the springless wooden cart, drawn by one or more of the tawny and under-sized but powerful oxen, with immense horns and elaborately carved yoke, which are characteristic of northern Portugal. For administrative purposes the province is divided into three districts: Viana do Castelo in the north, Braga in the centre, Oporto in the south. The chief towns are separately described; they include Oporto (169,353), one of the greatest wine-producing cities in the world; Braga (24,200), the seat of an archbishopric; Viana (12,623) and Povoa da Varzim (12,041), a place of considerable historical interest.
ENTREPIÓT (a French word, from the Lat. interpositum, that which is placed between), a storehouse or magazine for the temporary storage of goods, provisions, &c.; also a place where goods, which are not allowed to pass into a country duty free, are stored under the superintendence of the custom house authorities till they are re-exported. In a looser sense, any town with a particular distribution of trade is called an entrepôt. The word is also used attributively to indicate the kind of trade carried on in such towns.

ENTRE RIOS (Span. "between rivers"), a province of the eastern Argentine Republic, forming the southern part of a region sometimes described as the Argentine Mesopotamia, bounded N. by Corrientes, E. by Uruguay with the Uruguay river as the boundary line, S. by Buenos Aires and W. by Santa Fé; the Paraná river forming the boundary line with these two provinces. Pop. (1893) 292,019; (1905, est.) 376,600. The province has an area of 26,784 sq. m., consisting for the most part of an undulating, well-watered and partly-wooded plain, terminating in a low, swampy district of limited extent in the angle between the two great rivers. The great forest of Monteïl occupies an extensive region in the N., estimated at nearly one-fifth the area of the province. Its soil is exceptionally fertile and its climate is mild and healthy. At this stage, when the "garden of Argentina," which would probably be sufficiently correct had its population devoted as much energy to agriculture as they have to political conflict and civil war. Its principal industry is that of stock-raising, exporting live cattle, horses, hides, jerked beef, tinned and salted meats, beef extract, mutton and wool. Its agricultural products are also important, including wheat, Indian corn, barley and fruits. Lime, gypsum and firewood are also profitable items in its export trade. The Paraná and Uruguay rivers provide exceptional facilities for the shipment of produce and the Entre Rios railways, consisting of a trunk line running E. and W. across the province from Paraná to Concepción del Uruguay and several tributary branches, afford ample transportation facilities to the ports. Another railway line follows the Uruguay from Concordia northward into Corrientes. Entre Rios has been one of the most turbulent of the Argentine provinces, and has suffered severely from political disorder and civil war. Comparative quiet reigned from 1842 to 1870 under the autocratic rule of Gen. J. J. Urquiza. After his assassination in 1870 these partisan conflicts were renewed for two or three years, and then the province settled down to a life of comparative peace, followed by an extraordinary development in her pastoral and agricultural industries. Among these is the slaughtering and packing of beef, the exportation of which has reached large proportions. The capital is Paraná, though the seat of government was once at Concepción del Uruguay, and was again transferred to that town during Urquiza's domination. Concepción del Uruguay, or Concepción (founded 1778), is a flourishing town and port on the Uruguay, connected by railway with an extensive producing region which gives it an important export trade, and is the seat of a national college and normal school. Its population was estimated at 9,000 in 1905. Other large towns are Gualeguay and Gualeguaychú.

ENCYC (Fr. envoyé, "sent"), a diplomatic agent of the second rank. The word envoyé comes first into general use in this connexion in the 17th century, as a translation of the Lat. ablegatus or missus (see Diplomacy). Hence the word envoy is commonly used of any one sent on a mission of any sort.

ENZIO (c. 1220-1272), king of Sardinia, was a natural son of the emperor Frederick II. His mother was probably a German, and his name, Enzio, is a diminutive form of the German Heinrich (Henry). He was a great affection for him, and he was probably present in the battle of Cortenuova in 1237. In 1238 he was married, in defiance of the wishes of Pope Gregory IX., to Adelasia, widow of Ubaldo Visconti and heiress of Torres and Gallura in Sardinia. Enzio took at once the title of king of Torres and Gallura, and in 1243 that of king of Sardinia, but he only spent a few months in the island, and his sovereignty existed in name alone. In July 1250 he was appointed imperial viceroy in Italy, and sharing in his father's excommunication in the same year, took a prominent part in the war which broke out between the emperor and the pope. He commenced his campaign by subdividing the march of Ancona, and in May 1241 was in command of the forces which defeated the Genoese fleet at Meloria, where he seized a large amount of booty and captured Messina, which afterwards was proceeding to a council summoned by Gregory to Rome. Later he fought in Lombardy. In 1248 he assisted Frederick in his vain attempt to take Parma, but was wounded and taken prisoner by the Bolognese at Fossalta on the 26th of May 1249. His captivity was a severe blow to the Hohenstaufen cause in Italy, and was soon followed by the death of the emperor. He seems to have been very well treated by the people of Bologna, where he remained a captive until his death on the 16th of March 1272. He was apparently granted a magnificent funeral, and was buried in the church of St Dominic at Bologna. During his imprisonment Enzio is said to have been loved by Lucia da Viadagola, a well-born lady of Bologna, who shared his captivity and attempted to procure his release. Some doubt has, however, been cast upon this story, and the same remark applies to another which tells how two friends had almost succeeded in freeing him from prison concealed in the hair of a child. His remains were recognized by the people of Bologna to be those of Enzio, in his heroic youth, and his body was placed in the church of St Dominic at Bologna. His marriage with Adelasia had been declared void by the pope in 1243, and he left one legitimate, and probably two illegitimate daughters. Enzio forms the subject of a drama by E. B. S. Raupach and of an opera by A. F. B. Dulk.

See F. W. Grossman, König Enzio (Göttingen, 1883); and H. Blasius, König Enzio (Breslau, 1884).

ENZYME (Gr. ἐνζυμος, leavened, from ἐν, in, and ζυμον, leaven), a term, first suggested by Kühne, for an unorganized ferment (see Fermentation), a group of substances, in the constitution of plants and animals, which decompose certain carbon compounds occurring in association with them. See also Plants: Physiology, Nutrition, &c.

EOCENE (Gr. ἐος, dawn, cauros, recent), in geology, the name suggested by Sir C. Lyell in 1833 for the lower subdivision of the rocks of the Tertiary Era. The term was intended to convey the idea that this was the period which saw the dawn of the recent or existing forms of life, because it was estimated that among the fossils of this period only 3% of the species are still living. Since Lyell's time much has been learned about the fauna and flora of the period, and many palaeontologists doubt if any of the Eocene species are still extant, unless it be some of the lowest forms of life. Nevertheless the name is a convenient one and is in general use. The Eocene as originally defined was not long left intact, for E. Beyrich in 1834 proposed the term "Oligocene" for the upper portion, and later, in 1874, K. Schimper suggested "Paleocene" as a separate epoch preceding the Oligocene. The Oligocene division has been generally accepted as a distinct period, but "Paleocene" is not so widely used.

In north-western Europe the close of the Cretaceous period was marked by an extensive emergence of the land, accompanied, in many places, by considerable erosion of the Mesozoic rocks; a prolonged interval elapsed before a relative depression of the land set in and the first Eocene deposits were formed. The early Eocene formations of the London-Paris-Belgian basin were of fresh-water and brackish origin; towards the middle of the period they had become marine, while later they reverted to the original type. In southern and eastern Europe changes of sea-level were less pronounced in character; here the late Cretaceous seas were followed without much modification by those of the Eocene period, so rich in foraminiferal life. In many other regions, the great gap which separates the Tertiary from the Mesozoic rocks in the United States, where the Mesozoic rocks do not exist, and the boundary line is difficult to draw. Eocene strata succeed Cretaceous rocks without serious unconformity in the Libyan area, parts of Denmark, S.E. Alps, India, New Zealand and central N. America. The unconformity is marked in England, parts of Egypt, on the Atlantic coastal plain and in the eastern gulf region of N. America, as well as in the marine Eocene of western Oregon. The clastic Flysch formation of the
Carpathians and northern Alps appears to be of Eocene age in the upper and Cretaceous in the lower part. The Eocene sea covered at various times a strip of the Atlantic coast from New Jersey southward and sent a great tongue or bay up the Mississippi valley; similar epicontinental seas spread over parts of the Pacific border, but the plains of the interior with the mountains on the west were meanwhile being filled with terrestrial and lacustrine deposits which attained an enormous development. This great extension of non-marine formations in the Eocene of different countries has introduced difficulties in the way of exact correlation; it is safer, therefore, in the present state of knowledge, to make no attempt to find in the Eocene strata of America and India, &c., the precise equivalent of subdivisions that have been determined with more or less exactitude in the London-Paris-Belgian area.

It is possible that in Eocene times there existed a greater continuity of the northern land masses than obtains to-day. Europe at that time was probably united with N. America through Iceland and Greenland; while on the other side, America may have joined Asia by the way of Alaska. On the other hand, the great central, mediterranean sea which stretched across the Eurasian continents sent an arm northward somewhere just east of the Ural mountains, and thus divided the northern land mass in that region. S. America, Australia, and perhaps Africa may have been connected more or less directly with the Antarctic continent.

Associated, no doubt, with the crustal movements which closed the Cretaceous and inaugurated the Eocene period, there were local and intermittent manifestations of volcanic activity throughout the period. Diabases, gabbros, serpentines, soda-potash granites, &c., are found in the Eocene of the central and northern Apennines. Tuffs occur in the Veronese and Vicentin Alps—Ronca and Spelecochiss. Tuffs, basalts and other igneous rocks appear also in Montana, Wyoming, California, Oregon, Washington, Idaho, Colorado; also in Central America, the Antillean region and S. America.

It has been very generally assumed by geologists, mainly upon the evidence of plant remains, that the Eocene period opened with a temperate climate in northern latitudes; later, as indicated by the London Clay, Alum Bay and Bournemouth beds, &c., the temperature appears to have been at least subtropical. It should be observed that the frequent admixture of temperate forms with what are now tropical species makes it difficult to speak with certainty as to the degree of warmth experienced. The occurrence of lignites in the Eocene of the Paris basin, Tirol and N. America is worthy of consideration in this connexion. On the other hand, the coarse boulder beds in the lower Flysch have been regarded as evidence of local glaciation; this would not be inconsistent with a period of widespread geniality of climate, as is indicated by the large size of the nummulites and the dispersion of the marine Mollusca, but the evidence for glaciation is not yet conclusive.

Eocene Stratigraphy.—In Britain, with the exception of the Bovey beds (g.s.) and the leaf-bearing beds of Antrim and Mull, Eocene rocks are confined to the coasts of Cornwall and the western shores of the Irish Sea. They lie in the two well-marked synclinal basins of London and Hampshire which are conterminous in the western area (Hampshire, &c.), but are separated towards the east by the denuded anticline of the Weald. The strata in these two basins have been grouped in the following manner:

- **London Basin.**
  - Upper: Upper Bagshot Sands.
  - Middle: Middle Bagshot Beds and part of Lower Bagshot Beds.

- **Hampshire Basin.**
  - Headon Hill and Barton Sands.
  - Bracklesham Beds and leaf-bearing beds of Gournemont and Alum Bay.

- **London Clay and equivalent Bognor Beds, Woolwich and Reading Beds.**

The Thanet sands have not been recognized in the Hampshire basin; they are usually pale yellow and greensand with streaks of clay and at the base, resting on an evenly denuded surface of chalk is a very constant layer of green-coated, well-rounded chalk. It is about 100 ft. thick. The beds in this series vary in E. Kent, where it attains its most complete development. The Woolwich and Reading beds (see Reading Beds) contain both the eolian and estuarine sands and clays. The Woolwich and London Clay are the Oldhean beds or Blackheath pebbles, 20 to 50 ft., made up almost entirely of well-rounded flint pebbles set in sand; the fossils are marine and estuarine. Blackheath is a marl, contains much blue or brown clay with sandy layers and septarian nodules; its equivalent in the Hampshire area is sometimes called the Bognor beds and is exposed on the coast. The Ramsdown and Barton beds will be found briefly described under those heads.

Crossing the English Channel, we find in northern France and Belgium a series of deposits identified in their general characters with those of England. The antecilical ridge of the English Weald is prolonged south-eastwards on to the continent, and separates the basins from the French eolian areas much as it did the areas of London and Hampshire; and it is clear that at the time of deposition all four regions were intimately related and subject to similar variations of marine area. With time, the estuarine conditions. A series of strata so variable from point to point is it natural that many purely local phases should have received distinctive names; in the Upper Eocene of the Paris basin the more important formations are the highly fossiliferous marine sands known as the "Sands of Beauchamp," and the local fresh-water limestone, the "Calcaire de St. Ouen." The Middle Eocene is represented by the well-known "Crapaudier," about 90 ft. thick. The beds in this series vary a good deal lithologically, some being sandy, others marly or glauconitic; fossils are abundant. The Upper Calcareous marls or "Calcaire plat" is a fresh-water formation; the middle division is marlaceous; while the lower one is more of marine origin. The numerous quarries and mines for building stone in the neighbourhood of Paris have made it possible to acquire a very precise knowledge of the fossiliferous rocks. Many of the fossils received trade names, such as "Rochelette," "Roche," "Banc franc."

- Banc vert."
- "Cliquart."
- "Saint Nom": the two last named are distinctive. Better than these limestones are the nummulitic sands of Soissons and Soissons. The Lower Eocene contains the lignitic plastic clay (argile plastique) of Soissons and elsewhere; the limestones of Rilly and Sészanne and the greenish glauconitic sands of Brachez. The relative position of the above formations with respect to those of Belgium and England will be seen from the table of Eocene strata.

The Eocene deposits of southern Europe differ in a marked manner from those of the Anglo-Parisian basin. The most important feature is the great development of nummulitic limestone with thin marls and nummulitic sandstones. The sea in which the nummulitic limestones were formed occupied the site of an enlarged Mediterranean communicating with similar waters right round the coast, for these rocks are found not only in southern Europe, including all the Alpine tracts, Greece and Turkey and southern Russia, but they are well developed in northern Africa, Asia Minor, Palestine, and they may be followed through Persia, Baluchistan, India, into China, Tibet, Japan, Sumatra, Borneo and the Philippines. The eolian nummulitic limestones very often bear the degree of hardness and the eolian character where they have been subjected to elevation and compression as in the Alpine region, 10,000 ft. above the sea, or from 16,000, to 20,000 ft., in the central Asian plateau. Besides being a wide-spread formation, the nummulitic limestone is locally several thousand feet thick.

While the foraminiferal limestones were being formed over most of southern Europe, a series of eolian beds was formed in the Carpathians and the northern Alpine region, viz., the Flysch and the Vienna sandstone. Some portions of this Alpine Eocene are coarsely conglomeratic, and in places there are boulders of
non-local rocks of enormous dimensions included in the argillaceous or sandy matrix. The occurrence of these large boulders together with the scarcity of fossils and the palynological information; but the evidence lithostratigraphic is not conclusive. C. W. von Gjöbel has classified the Eocene of the northern Alps (Bavaria, &c.)

**Upper Eocene**
- Flysch and Vienna sandstone, with younger nummular beds and Häring group.

**Middle Eocene**
- Kressenberg Beds, with older nummulitic marls.

**Lower Eocene**
- The Häring group of northern Tirol contains lignite beds of some importance. In the southern and S.E. Alps the following divisions are recognized.

**Upper Eocene**
- Macigno or Tassello—Vienna Sandstone, conglomerates, marls and shales.

**Middle Eocene**
- Nummulitic limestones, three subdivisions.
- Liburnian stage (or Soeteostroece), foraminiferal limestones with fresh-water intercalations at the top and bottom, the Cosinus beds, fresh-water in the middle of the series.

In the central and northern Atlantic coastal plain the Eocene strata have been subdivided by Prof. F. Saccio into an upper Bartonian, a middle Parisian and a lower Suessonian series. In the middle member are the representatives of the Flysch and the Macigno. These Eocene strata are upwards of 5,000 ft. thick. In northern Africa the nummulitic limestones and sandstones are widely spread; the lower portions comprise the Libyan group and the shales of Essen on the Nile. Of the African Eocene fauna only that of the Atlas and the scrubbed Atlas has been looked at; the fossiliferous strata of Benghazia, 1,500 to 2,000 ft., consisting of clays with gypsum and lignite, shales and sandstones; these beds have, side by side with Eocene nummulites, a few fossils of Cretaceous affinities. Above the Ramlah group is the massive nummulitic limestone and sandstone of the Kithar group; these are succeeded by the nummulitic limestones and shales at the base of the Nari group. In the southern Himalayan region the nummulitic series of the Eocene is well developed, but there are difficulties in fixing the line of demarcation between this and the younger formations. The lower part of the Sirmur series of the Simla district may belong to this period; it is subdivided into a gneiss, a gneiss, a gneiss, a gneiss, and a gneiss, part of the Kithar group with the Subat group at the base. Beneath the thick nummulitic Eocene limestone of the Salt Range are shales and marls with a few coal seams. The marine Eocene rocks of N. America are most extensively developed round the coast of the Gulf of Mexico, whence they spread into the valley of the Mississippi and, as a comparatively narrow strip, along the Atlantic coast. The series in Alabama, which may be taken as typical of the Gulf coast Eocene, is as follows:
- Upper Jacksonian, White limestone of Alabama (and Vicksburg?)
- Middle Claibornean, Buhtrstone series.
- Lower Chickasawian Sands and lignites.
- Midwayan or Clayton formation, a limestone.

The above succession is not fully represented in the Atlantic coast.

On the Pacific coast marine formations are found in Oregon and California; such are the Tejon series with lignite and oil; the Eocene deposits are those of the Rocky Mountains and the adjacent western plains, in Wyoming, Nebraska, Colorado, &c.; they are of terrestrial, lacustrine or marine origin. The Eocene deposits of Wyoming and Colorado are, in part at least, part of the Cretaceous, and because they were the scarcest synchronous, there is considerable difficulty in placing them in their true position in the time-scale. The main divisions or groups are generally recognized as follows:

**Upper Eocene**
- Uinta Group, 800 ft. (=? Jacksonian).
- Bridger Group, 2,000 ft. (=? Claibornean).
- Wind River Group, 800 ft.
- Wasatch Group, 2,000 ft. (=? Chickasawian).

**Lower Eocene**
- Torreyton Group, 300 ft.
- Puerco Group, 500 to 1,000 ft.

The Fort Union beds of Canada and parts of Montana and N. Dakota are probably the oldest Eocene strata of the Western Interior; they are 1,000 feet thick and possibly are equivalent to the Miocene group. But in these beds, as in those known as Arapahoe, Livingston, Denver, Ohio and Ruby, which are now often classified as the Fort Union, the upper part of the beds is transitional between the Mesozoic and Tertiary systems. There is, however, a marked unconformity between the Eocene Tertiary or San Miguel and Poison Canyon formations of Colorado and the underlying Laramie rocks.

Many local aspects of Eocene rocks have received specific names, but too little is known about them to enable us to make out a distinct recognition of the Eocene rocks in the United States. The Eocene of the John Day basin, Oregon, the Finny conglomerate of Yellowstone Park, the Sphinx conglomerate of Montana, the Ono and Makahayu conglomerates of Puget Sound, the Maestrichti shales of Utah, the Mojave formation of S. California, and the Amoyon formation of Nevada.

Of the Eocene of other countries little is known in detail. The strata of this age occur in Central and S. America (Paragoria-Megelian series—Brazil, Chile, Argentina), in S. Australia (and in the Great Australian Bight), New Zealand, in Seymour Island near Graham Land in the Antarctic Regions, Japan, Java, Borneo, New Guinea, Moluccas, Philippines, New Caledonia, also in Greenland, Bear Island, Spitzbergen and Siberia.

**Organic Life of the Eocene Period.**—As it has been observed above, the name Eocene was given to this period on the ground that it is the "Age of living Things"; this phrase is now present; this estimation was founded upon the assemblage of invertebrate remains which, from the commencement of this period until the present day, there has been comparatively little change. The real biological interest of the period centres around the higher vertebrate types. In the marine mollusca the most noteworthy change is the entire absence of ammonoids, the group which throughout the Mesozoic era had taken so prominent a place, but disappeared completely with the close of the Cretaceous. Nautiloids were more abundant than they are at present, but as a whole the Cephalopods took a more subordinate part than they had done in previous periods. On the other hand, Gasteropods and Pelecypods found in the numerous shallow seas a very suitable environment and flourished exceedingly, and their shells are often preserved in a state of great perfection and in enormous numbers. Of the Gasteropoda genera Cerithium with its estuarine and lagoonal forms Polamides, Polamidopsis, &c., is very characteristic; Rostellaria, Voluta, Fusus, Pleurotomaria, Conus, Tylus, may also be cited. Cardium, Venericaria, Cussatella, Corbulomya, Cysthea, Lucina, Anomia, Ostrea are a few of the many Pelecypod genera. Echinoderms were represented by abundant sea-urchins, Echinolampas, Linithia, Conocyclus, &c. Corals flourished on the numerous reefs and approached to modern forms (Tetrahymena, Dendrophyllia). But by far the most abundant marine organism was the Ctenodactyl, which flourished in the oceans and was abundant in countless myriads. Foremost among these are the Nummulites, which by their extraordinary numerical development and great size, as well as by their wide distribution, demand special recognition. Many other genera of almost equal importance as rock builders, lived at the same time: Orthisphragma, Operculina, Asinina, Orbitolites, Miliola, Alveolina. Crustaceae were fairly abundant (Xanthopsis, Poritamus), and most of the orders and many families of modern insects were represented.

When we turn to the higher forms of life, the reptiles and mammals, we find a remarkable contrast between the fauna of the Eocene and those periods which preceded and separated it. The great group of Saurian reptiles, whose members had held dominion on land and sea during most of the Mesozoic time, had completely disappeared by the beginning of the Eocene; in their place placental mammals made their appearance and rapidly became the dominant group. Among the early Eocene mammals no trace can be found of the numerous and clearly-marked orders with which we are familiar to-day; instead we find obscurely differentiated types, which cannot be fitted without violence into any of the modern orders. The early placental mammals were generalized types (with certain non-placental characters) with potentialities for rapid divergence and development in the direction of the more specialized modern orders. Thus, the Creodonta foreshadowed the Carnivora, the
Condylarthra presaged the herbivorous groups; but before the close of this period, so favourable were the conditions of life to a rapid evolution of types, that most of the great orders had been clearly defined, though none of the Eocene genera are still extant. Among the early carnivores were Arctocyon, Palaeoconis, Amblyodonus, Hyaenodon, Cynodon, Promonoster, Protarchis. The primitive dog-like forms did not appear until late in the period, in Europe; and true cats did not arrive until later, though they were represented by Eumetala in the Upper Eocene of France. The primitive ungulates (Condylarthra) were generalized forms with five effective toes, exemplified in *Phacoceros*. The gross Amblypoda, with five-toed stumply feet (*Coryphodon*), were prominent in the early Eocene; particularly striking forms were the Dinoceratae, Dinoceras, with three pairs of horns or protuberances on its massive skull and a pair of huge canine teeth projecting downwards; *Tinoceras, Uindatherium, Loxo- phodon*, &c.; these elephantine creatures, whose remains are so abundant in the Eocene deposits of western America, died out before the close of the period. The divergence of the hoofed mammals into the two prominent divisions, the odd-toed and even-toed, began in this period, but the former did not get beyond the three-toed stage. The least differentiated of the odd-toed group were the Lophodontas: tapers were foreshadowed by *Systemodon* and similar forms (*Palaeotherium, Palaeolotherium*); the peccary-like *Hyracotherium* was a forerunner of the horse, *Hyochoerus* was a primitive rhinoceros. The evolution of the horse through such forms as *Hyracotherium, Pachycephalosaurus, Eohippus*, &c., appears to have proceeded along parallel lines in Eurasia and America, but the true horse did not arrive until later. Ancestral deer were represented by *Dichobune, Amphi- troglus* and others, while many small hog-like forms existed (*Diplopus, Eohyrus, Hyopontias, Homacodon*). The primitive stock of the camel group developed in N. America in late Eocene time and sent branches into S. America and Eurasia. The edentates were very generalized forms at this period (Gan-

1 Bartonien from Barton, England.
2 Lutétien = Lutetia = Paris.
3 Yprésien = Ypres, Flanders.
4 Landénien = Landen, Belgium.
5 Thaniacien = The Isle of Thanet.
6 Paniséliens = Mont Panisel, near Mons.
7 Other names that have been used to subdivide the epoch of the Eocene not included in the table are Parisien and Sussonian (Soisson): Ludien (Ludes in the Paris basin) and Priabonian (Pribona in the Vicentine Alps); Heersien (Heer near Maastricht) and Wennemelen (Wemmel, Belgium); very many more might be mentioned.

EON DE BEAUMONT.

Charles Geneviève Louise Auguste André Titothée d' (1728–1810), commonly known as the Chevalier d’Eon, French political adventurer, famous for the supposed mystery of his sex, was born near Tonnerre in Burgundy, on the 7th of October 1728. He was the son of an advocate of good position, and after a distinguished course of study at the Collège Mazarin he became a doctor of law by special dispensation before the usual age, and adopted his father's profession. He
began literary work as a contributor to Fréron's *Annales littéraires*, and attracted notice as a political writer by two works on financial and administrative questions, which he published in his twenty-fifth year. His reputation increased so rapidly that in 1755 he was, on the recommendation of Louis François, prince of Conti, entrusted by Louis XV. (who had originally started his "secret" foreign policy—i.e. by undisclosed agents behind the backs of his ministers—in favour of the prince of Conti's ambition to be king of Poland) with a secret mission to the court of Russia. It was on this occasion that he is said to have been the first to assume the dress of a woman, with the connivance, it is supposed, of the French court.  

In this disguise he obtained the appointment of reader to the empress Elizabeth, and won her over entirely to the views of his royal master, with whom he maintained a secret correspondence during the whole of his diplomatic career. After a year's absence he returned to Paris to be immediately charged with a second mission to St Petersburg, in which he figured in his true sex, and as brother of the reader who had been at the Russian court the year before. He played an important part in the negotiations between the courts of Russia, Austria and France during the Seven Years' War. For these diplomatic services he was rewarded with the decoration of the grand cross of St Louis. In 1759 he served with the French army on the Rhine as aide-de-camp to the marshal de Broglie, and was wounded during the campaign. He had held for some years previously a commission in a regiment of dragoons, and had distinguished himself for his skill both in horse and foot, and early in fencing. In 1762, on the return of the duc de Nivernais, d'Eon, who had been secretary to his embassy, was appointed his successor, first as resident agent and then as minister plenipotentiary at the court of Great Britain. He had not been long in this position when he lost the favour of his sovereign, chiefly, according to his own account, through the adverse influence of Madame de Pompadour, who was jealous of him as a secret correspondent of the king. Suppressed by the court of Versailles, d'Eon showed his irritation by denying the genuineness of the letter of appointment, and by raising an action against Guercy for an attempt to poison him. Guercy, on the other hand, had previously commenced an action against d'Eon for libel, founded on the publication by the latter of certain state documents of which he had possession in his official capacity. Both parties succeeded in so far as a true bill was found against Guercy for the attempt to murder d'Eon; but, by pleading his privilege of ambassador, he escaped a trial, and d'Eon was found guilty of the libel. Failing to come up for judgment when called on, he was outlawed. For some years afterwards he lived in obscurity, appearing in public chiefly at fencing matches. During this period rumours as to the sex of d'Eon, originating probably in the story of his first residence at St Petersburg as a female, began to excite public interest. In 1774 he published at Amsterdam a book called *Les Loisirs du Chevalier d'Eon*, which stimulated gossip. Bets were frequently laid on the subject, and an action raised before Lord Mansfield in 1777 for the recovery of one of these bets brought the question to a judicial decision, by which d'Eon was declared a female. A month after the trial he returned to France, having received permission to do so as the result of negotiations in which Beaumarchais was employed as agent. The conditions were that he was to deliver up certain state documents in his possession, and to wear the dress of a female. The reason for the latter of these stipulations has never been clearly explained, but he complied with it to the close of his life. In 1784 he received permission to visit London for the purpose of bringing back his library and other property. He did not, however, return to France, though after the Revolution he sent a letter, using the name of Madame d'Eon, in which he offered to serve in the republican army. He continued to dress as a lady, and took part in fencing matches with success, though as late as 1796 he was in London. He died in London on the 22nd of May 1810. During the closing years of his life he is said to have enjoyed a small pension from George III.

1 But see Lang's *Historical Mysteries*, pp. 241-242, where this traditional account is discussed and rejected.

A post-mortem examination of the body conclusively established the fact that d'Eon was a man.

The best modern accounts are in the duc de Broglie's *Le Secret du roi* (1888); Captain J. Buchan Telfer's *Strange Career of the Chevalier d'Eon* (1888); Octave Homberg and Fernand Jousselin, *Le Chevalier d'Eon* (1904); and A. Lang's *Historical Mysteries* (1904).

**ÉÖTVÖS, JÓZSEF**, Baron (1813-1871), Hungarian writer and statesman, the son of Baron Ignacz Éötvös and the baroness Lillian, was born at Buda on the 15th of September 1813. After having received a thorough education at the Jesuit College, Éötvös was sent to the University of Vienna, which was then a necessity, and was early introduced to political life by his father. He also spent many years in western Europe, assimilating the new ideas both literary and political, and making the acquaintance of the leaders of the Romantic school. On his return to Hungary he wrote his first political work, *Prison Reform*; and at the diet of 1839-1840 he made a great impression by his eloquence and learning. One of his first speeches (published, with additional matter, in 1841) warmly advocated Jewish emancipation. Subsequently, in the columns of the *Pesti Hírlap*, Éötvös disseminated his progressive ideas farther afield, his standpoint being that the necessary reforms could only be carried out administratively by a responsible and purely national government. The same sentiments pervade his novel *The Village Notary* (1844-1845), one of the classics of the Magyar literature, as well as in the less notable romance *Hungary in 1514* about the cruelty of the Turks. In 1843, though deprived of his parochial clergy's office, but his popularity among the Jews and his public career. He was now generally regarded as one of the leading writers and politicians of Hungary, while the charm of his oratory was such that, whenever the archduke palatine Joseph desired to have a full attendance in the House of Magnates, he called upon Éötvös to address it. The February revolution of 1848 was the complete triumph of Éötvös' ideas, and he held the portfolio of public worship and instruction in the hands of the Hungarian ministry. His influence was far beyond his own department. Éötvös, Déak and Széchenyi represented the pacific, moderating influence in the council of ministers, but when the premier, Baththyány, resigned, Éötvös, in despair, retired for a time to Munich. Yet, though withdrawn from the tempests of the War of Independence, he continued to serve his country with his pen. His *Influence of the Ruling Ideas of the 19th Century on the State* (Pest, 1851-1854; German editions at Vienna and Leipzig the same year) profoundly influenced literature and public opinion in Hungary. On his return home, in 1851, he kept resolutely aloof from all political movements. In 1859 he published *The Guarantees of the Power and Unity of Austria* (Ger. ed. Leipzig, same year), in which he tried to arrive at a compromise between personal union and ministerial responsibility on the one hand and centralization on the other. After the Italian war, however, such a halting-place was regarded as inadequate by the majority of the nation. In the diet of 1861 Éötvös was one of the most loyal followers of Déak, and his speech in favour of the "Address" (see Déak, Francis) made a great impression at Vienna. The enforced calm which prevailed during the next few years enabled him to devote himself once more to literature, and, in 1866, he was elected president of the Hungarian academy. In the diets of 1865 and 1867 he fought zealously by the side of Déak, with whose policy he now completely associated himself. On the formation of the Andrássy cabinet (Feb. 1867) he once more accepted the portfolio of public worship and education, being the only one of the ministers of 1848 who thus returned to office. He had now, at last, the opportunity of realizing the ideals of a lifetime. That very year the diet passed his bill for the emancipation of the Jews; though his further efforts in the direction of religious liberty were less successful, owing to the opposition of the Catholics. But his greatest achievement was the National Schools Act, the most complete system of education provided for Hungary since the days of Maria Theresa. Good Catholic though he was (in matters of religion he had been the friend and was the disciple of Montalembert), Éötvös looked with disfavour on the dogma of papal infallibility, promulgated in 1870, and when the bishop of
Fehérvár proclaimed it, Éotvös cited him to appear at the capital ad audiendum verbum regnum. He was a constant defender of the composition with Austria (Ausgleich), and during the absence of Andrassy used to preside over the council of ministers; but the labours of the last few years were too much for his failing health. He died on the evening of the 2nd of May 1879; a statue was erected to him at Pest in the square which bears his name.

Éotvös occupied a prominent place in Hungarian literature as in Hungarian politics. His peculiarity, both as a politician and as a statesman, lies in the fact that he was a true philosopher, a philosopher at heart as well as in theory; and in his poems and novels he clothed in artistic forms all the great ideas for which he contended in social and political life. The best of his verses as well as the most significant of his ballads, but his poems are insignificant compared with his romances. It was The Carthaginians, written on the occasion of the floods at Pest in 1838, that first took the public by storm. The Magyar novel was then in its infancy, being chiefly represented by the historico-epics of Jósiá. Éotvös first modernized it, giving prominence in his pages to current social problems and political aspirations. The famous Village Notary came still nearer to actual life, while Hungary in 1524, in which the tenets of the Dozsa (Donza) Jacobites were elaborated, is especially interesting because it attributes the great national catastrophe of Mohács to the blind selfishness of the Magyar nobility and the intense sufferings of the people. Yet, as already stated, all these books are written with a moral purpose, and their somewhat involved and difficult style is, nowadays at any rate, a trial to those who are acquainted with the easy, brilliant and lively novels of Jósiá.

The best edition of Éotvös' collected works is that of 1891, in 17 vols. Comparatively few of his writings have been translated, but there are a good English version (London, 1890) and numerous German versions of The Village Notary, while The Emancipation of the Jews has been translated into Italian and German (Pest, 1841-1842), and a German translation of Hungary in 1524, under the title of Der Bauernkrieg in Ungarn was published at Pest in 1850.

ERAPACH, an official, a governor of a province of Roman Greece, τραγευς, whose title was equivalent to, or represented that of the Roman praefectus. The area of his administration was called an eparchy (μηναδα). The term survives as one of the administrative units of modern Greece, the country being divided into monarchical units, again subdivided into eparchies, again subdivided into demarchies (see GREECE: Local Administration). "Eparch" and "eparchy" are also used in the Russian Orthodox Church for a bishop and his diocese respectively.

EPAMONDAS (c. 418-362), Theban general and statesman, born about 418 B.C. of a noble but impoverished family. For his education he was chiefly indebted to Lysis of Tarentum, a Pythagorean exile who had found refuge with his father Polyxen. He first comes into notice in the attack upon Mantinea in 385, when he commanded a Spartan side-train in the siege of Pelopidas. In his youth Epamondas took little part in public affairs; he held aloof from the political assassinations which preceded the Theban insurrection of 370. But in the following campaigns against Sparta he rendered good service in organizing the Theban defence. In 371 he represented Thebes at the congress in Sparta, and by his refusal to surrender the Boeotian cities under Theban control prevented the conclusion of a general peace. In the ensuing campaign he commanded the Boeotian army which met the Peloponnesian levy at Leuctra, and by a brilliant victory on this site, due mainly to his daring innovations in the tactics of the heavy infantry, established at once the predominance of Thebes among the land-powers of Greece and his own fame as the greatest and most original of Greek generals. At the instigation of the Peloponnesian states which armed against Sparta in consequence of this battle, Epamondas in 370 led a large host into Laconia; though unable to capture Sparta he ravaged its territory and dealt a lasting blow at Sparta's predominance in Peloponnesus by liberating the Messenians and rebuilding their capital at Messene. Accused on his return to Thebes of having exceeded the term of his command, he made good his defence and was re-elected beocetarch. In 360 he forced the Isthmian lines and secured Sicyon for Thebes, but gained no considerable successes. In the following year he served as a common soldier in Tesslera, and upon being reinstated in command contrived the safe retreat of the Theban army from a difficult position. Returning to

Thessaly next year at the head of an army he procured the liberation of Pelopidas from the tyrant Alexander of Pherae without striking a blow. In his third expedition (356) to Peloponnesus, Epamondas again eluded the Isthmian garrison and won over the Achaenans to the Theban alliance. Turning his attention to the growing maritime power of Athens, Epamondas next equipped a fleet of 100 triremes, and during a cruise to the Propontis detached several states from the Athenian confederacy. When subsequent complications threatened the position of Thebes in Peloponnesus he again mustered a large army in order to crush the newly formed Spartan league (352). After some masterly operations between Sparta and Mantinea, by which he nearly captured both these towns, he engaged in a naval battle on the Asteraios, and by his vigorous shock tactics gained a complete victory over his opponents (see MANTINEA). Epamondas himself received a severe wound during the combat, and died soon after the issue was decided. His title of fame rests mainly on his brilliant qualities both as a strategist and as a tactician; his influence on military art in Greece was of the greatest. For the purity and uprightness of his character he likewise stood in high repute; his culture and eloquence equaled the highest Attic standard. In politics his policy of centralization and overthrow of the Dozsa (Donza) government was completely destroyed, and this is especially interesting because it attributes the great national catastrophe of Mohács to the blind selfishness of the Magyar nobility and the intense sufferings of the people. Yet, as already stated, all these books are written with a moral purpose, and their somewhat involved and difficult style is, nowadays at any rate, a trial to those who are acquainted with the easy, brilliant and lively novels of Jósiá.
ÉPÉE-DE-COMBAT

devoted himself to the study of law; but about the time of his admission to the bar of Paris, the bishop of Troyes granted him ordination, and offered him a canonry in his cathedral. This bishop died soon after, and the abbé, coming to Paris, was, on account of his relations with Soanian, the famous Jansenist, deprived of his ecclesiastical functions by the archbishop of Beaumont. About the same time it happened that he heard of two deaf mutes whom a priest lately dead had been endeavouring to instruct, and he offered to take his place. The Spaniard Pereira was then in Paris, teaching the results he had obtained in dealing with deaf mutes; and it has been affirmed that it was from him that Épée obtained his manual alphabet. The abbé, however, affirmed that he knew nothing of Pereira’s method; and whether he did or not, there can be no doubt that he attained far greater success than Pereira or any of his predecessors, and that the whole system now followed in the instruction of deaf mutes virtually owes its origin to his intelligence and devotion. In 1735 he founded, for this beneficent purpose, a school which he supported at his own expense until his death, and which afterwards was succeeded by the “Institution Nationale des Sourds Muets à Paris,” founded by the National Assembly in 1791. He died on the 23rd of December 1789.

In 1838 a bronze monument was erected over his grave in the church of Saint Roch. He published various books on his method of instruction, but that published in 1784 virtually superseded all others. It is entitled La Veritable Manière d’instruire les sourds et muets, confirmée par une longue expérience. He also began a Dictionnaire général des signes, which was completed by his successor, the abbé Sicard.

ÉPÉE-DE-COMBAT, a weapon still used in France for duelling, and there and elsewhere (blunted, of course) for exercise and amusement in fencing (q.v.). It has a sharp-pointed blade, about 35 in. long, without any cutting edge, and the guard, or shell, is bowl-shaped, having its convexity towards the point. The épee is the modern representative of the small-sword, and both are distinguished from the one rapier, in point of size, by being several inches shorter and much lighter in weight. The small-sword (called thus in opposition to the heavy cavalry broadsword), was worn by gentlemen in full dress throughout the 18th century, and it still survives in the modern English court costume.

Fencing practice was originally carried on without the protection of any mask for the face. Wire masks were not invented till near 1780 by a famous fencing-master, La Boëssière the elder, and did not come into general use until much later. Consequently, in order to avoid dangerous blows to the face, and especially the eyes, it was long the rigorous etiquette of the fencing-room that the point should always be kept low.

In the 17th century a Scottish nobleman, who had procured the assassination of a fencing-master in revenge for having had one of his eyes destroyed by the latter at sword-play, pleaded on his trial for murder that it was the custom to “spare the face.”

Rowlandson’s well-known drawing of a fencing bout, dated 1787, shows two accomplished amateurs making a foil assault without masks, while in the background a less practised one is having a wire mask tied on.

For greater safety the convention was very early arrived at that no hits should count in a fencing-bout except those landing on the breast. Thus sword-play soon became so unpractical as to lose much of its value as a training for war or the duel. For, hits with “sharps” take effect wherever they are made, and many an expert fencer of the old school has been seriously wounded, or lost his life through such accidents. The days of Angelo, of Danet, and the famous chevalier de St George, who were among the first to adopt the fleuret also. All the illustrious French professors who came after them, such as La Boëssière the younger, Lafaugère, Jean Louis, Cordelois, Grisier, Bertrand and Robert, with amiable looks of a baron d’Espelîa, were foil-players pure and simple, whose reputations were gained before the modern épee play had any recognized status. It was reserved for Jacob, a Parisian fencing-master, to establish in the last quarter of the 19th century a definite method of the épee, which differed essentially from all its forerunners. He was soon followed by Baudry, Spinnewyn, Laurent and Ayat. The methods of the four first-named, not differing much inter se, are based on the perception that in the real sword fight, where hits are effective on all parts of the person, the “classical” bent-arm guard, with the foil inclining upwards, is hopelessly bad. It offers a tempting mark in the exposed sword-arm itself, while the point requires a movement to bring it in line for the attack, which involves a fatal loss of time. The épee is really in the nature of a short lance held in one hand, and for both rapidity and precision of attack, as well as for the defence of the sword-arm and the body behind it, a position of guard with the arm almost fully extended, and épee in line with the forearm, is far the safest. Against this guard the direct lance at the body is impossible, except at the risk of a mutual or double hit (le coup des deux veuves). No safe attack at the face or body can be made without first binding or beating, opposing or evading the adverse blade, and such an attack usually involves an initial forward movement. Beats and binds of the blade, with the body of the body, or counter-attacks with opposition, render the old foil-parries in most instances, except at close quarters. And much of the offensive is reduced to thrusts at the wrist or forearm, intended to disable without seriously wounding the adversary. The direct lance (coup-droit) at the body often succeeds in turneetums, but usually at the cost of a counter hit, which, though later in time, would be fatal with sharp weapons.

Ayat’s method, as might be expected from a first-class foil-player, was less simple, more original, and with great simplicity it marked the most successful épee-play, because it usually gained its most conspicuous victories over those who attempted a foil defence, and whose practice gave them no safe strokes for an attack upon the extended blade. But by degrees the épéists themselves discovered new ways of attacking with comparative safety, and at the present day a complete épéist is master of a large variety of attractive as well as scientific movements, both of attack and defence.

Rowlandson’s and according to all experts that this development was achieved. Perhaps the most conspicuous representative of the new school is J. Joseph-Renaud, a consummate swordsman, who has also been a champion foil-player. Lucien Gaudin, Albert and Edmond Wallace may be also mentioned as among the most skilful amateurs, Albert Ayat and L. Bouché as professors—all of Paris. Belgium, Italy and England have also produced épéists quite of the first rank.

The épee lends itself to competition far better than the foil, and the revival of the small-sword soon gave rise in France to “pools” and “tournaments” in which there was the keenest rivalry between all comers.

In considering the épee from a British point of view, it may be mentioned that it was first introduced publicly in London by C. Newton-Robinson at an important assault-at-arms held in the Steinvay Hall on the 4th May 1900. Professor Spinnewyn was the principal demonstrator, with his pupil, the late Willy Bowles. In what is now the School of Arms, Lincoln’s Inn, the first English open épee tournament for amateurs. It was won by W. Sulzbacher, C. Newton-Robinson being second, and Paul Ettinger, a French resident in London, third. This was immediately followed by the institution of the Épée Club of London, which, under the successive residencies of a veteran swordsman, Sir Edward Jenkinson, and of Lord Desborough, subsequently held annual open international tournaments. The winners were: in 1901, Willy Sulzbacher; 1903, Robert Montegomery; 1905, the marqueen de la Marquais Laubat; 1904, J. J. Renaud; 1905, R. Montegomery. In 1906
the Amateur Fencing Association for the first time recognized the best-placed Englishman, Edgar Seligman (who was the actual winner), as the English épée champion. In 1907 R. Montgomery was again the winner, in 1908 C. L. Daniell, in 1909 R. Montgomery. Edgar Seligman was the representative of the English amateurs who were the earliest to perceive the wonderful possibilities of épée-play, it is right to mention Captain Hutton, Lord Desborough, Sir Cosmo Duff-Gordon, Bart., Sir Charles Dilke, Bart., Lord Howard de Walden, Egerton Castle, A. S. Cope, R.A., W. H. C. Staveley, C. F. Clay, Lord Morpeth, Evan James, Paul King, J. B. Cunliffe, John Norbury, Jr., Theodore A. Cook, John Jenkins, R. Montgomery, S. Martineau, E. B. Milnes, H. S. Stirling, R. Stier, Dufferin, Hugh Pollock, R. W. Doyley, A. G. Ross, the Hon. Ivor Guest and Henry Balfour.

Among foreign amateurs who did most to promote the use of the épée in England were Messrs P. Ettlinger, Anatole Paroissien, J. Joseph-Reinuda, W. Sulzbacher, René Lacroix, H. G. Berger and the Marquis de Chasselay-Laubat.

Épée practice became popular among Belgian and Dutch fencers about the same time as in England, and this made it possible to set on foot international team-contests for amateurs, which have done much to promote good feeling and acquaintance among swordsmen of several countries. In 1903 a series of international matches between teams of six was inaugurated in Paris. Up to 1909 the French team uniformly won the first place, with Belgium or England second.

English fencers who were members of these international teams were Lord Desborough, Theodore A. Cook, Bowden, Cecil Haig, Norbury, Jr., R. Montgomery, John Jenkins, F. Townsend, W. H. C. Staveley, S. Martineau, C. L. Daniell, W. Godden, Captain Haig, M. D. V. Holt, Edgar Seligman, C. Newton- Robinson, A. V. Buckland, M. Davson, E. M. Amphlett and L. V. Fildes. In 1906 a British épée team of four, consisting of Lord Desborough, Sir Cosmo Duff-Gordon, Bart., Edgar Seligman and C. Newton- Robinson, with Lord Howard de Walden and Theodore Cook as reserves (the latter acting as captain of the team), went to Athens to compete in the international match at the Olympic games. After defeating the Germans rather easily, the team opposed and worsted the Belgians. It then found itself matched against the French in the final, the Greek team having been beaten by the French and the Dutch eliminated by the Belgians. After a very close fight the result was officially declared a tie. This was the first occasion upon which an English fencing team had encountered a tie in a match of this kind every even year. In fighting off the tie, however, the French were awarded the first prize and the Englishmen the second.

In the Olympic games of London, 1908, the Épée International Individual Tournament was won by Allibert (France), but Montgomery, Haig and Holt (England) took the 4th, 5th, and 8th places in the final pool. The result of the International Team competition was also very creditable to the English representatives, Daniell, Haig, Holt, Montgomery and Amphlett, who by defeating the Dutch, Germans, Danes and Belgians took second place to the French. Egerton Castle was captain of the English team.

In open International Tournaments on the Continent, English épeistes have also been coming to the front. None had won such a competition up to 1909 outright, but the following had reached the final pool: C. Newton-Robinson, Brussels, 1901 (10th), Épées équestres, 1909 (1st); E. Seligman, Copenhagen, 1902 and 1909, Paris, 1909 (12th); R. Montgomery, Paris, 1909 (5th); and E. M. Amphlett, Paris, 1900 (10th).

The method of ascertaining the victor in épée "tournaments" is by dividing the competitors into "pools," usually of six or eight fencers. Each of these fights an assault for first hit only, with every other member of the same pool, and he who is least often hit, or not at all, is returned the winner. If the competitors are numerous, fresh pools are formed out of the first two, three or four in each pool of the preliminary round, and so on, until a small number are left in for a final pool, the winner of which is the victor of the tournament.

Épée fencing can be, and often is, conducted indoors, but one of its attractions consists in its fitness for open-air practice in pleasant gardens.

In the case of the épée the most essential points are (1) the position of the sword-arm, which, whether fully extended or not, should always be so placed as to ensure the protection of the wrist, forearm and elbow from direct thrusts, by the intervention of the guard or shell; (2) readiness of the legs for instant advance or retreat; and (3) the way in which the weapon is held, the best position (though hard to acquire and maintain) being that adopted by J. J. Renaud with the fingers over the grip, so that a forward beat does not easily disarm.

The play of individuals is determined by their respective temperaments and physical powers. But every fencer should be always ready to deliver a well-aimed, swift, direct thrust at any exposed part of the antagonist's arm, his mask or thigh. Very tall men, who are usually not particularly quick on their legs, should not as a rule attack, otherwise than by direct thrusts, when matched against shorter men. For if they merely extend their sword-arm in response to a simple attack, their longer reach will ward it off with a stop or counter-thrust. Short men can only attack them safely by beating, binding, grasping, pressing or evading the blade, and the taller fencers must be prepared with all the well-known parries and counters to such offensive movements, as well as with the stop-thrust to be made either with advancing opposition or with a retreat. Fencers of small stature must be exceedingly quick on their feet, unless they possess the art of parrying to perfection, and even then, if slow to shift ground, they will continually be in danger. With plenty of room, the quick mover can always choose the moment when he will be within distance, for an attack which his slower opponent will be always fearing and unable to prevent or anticipate.

It is desirable to put on record the modern form of the weapon. An average épée weighs, complete, about a pound and a half, while a foil weighs approximately one-third less. The épée blade is exactly like that of the old small-sword after the abandonment of the "colichemarde" form, in which the "forte" of the blade was greatly thickened. In length from guard or shell to point it measures about 35 in., and in width at the shell about $\frac{1}{4}$ths of an inch. From this it gradually and regularly tapers to the point. There is no cutting edge. The side of the épée which is usually held uppermost is slightly concave, the other is strengthened with a midrib, nearly equal in thickness and configuration, in shape to either half of the true blade. The material is tempered steel. There is a haft or tang about 8 in. long, which is pushed through a circular guard or shell ("coquille") of convex form, the diameter of which is normally 5 in. and the convexity $\frac{1}{2}$ in. The shell is of steel or aluminium, and if of the latter metal, sometimes fortified at the centre with a disk of steel the size of a crown piece. The insertion of the haft or tang through the shell may be either central or eccentric to the extent of about 1 in., for the better protection of the outside of the forearms.

After passing through the shell, the haft of the blade is inserted in a grip or handle ("poignet"), averaging 7 in. in length and of quadrangular section, which is made of tough wood covered with leather, india-rubber, wound cord or other strong material with a rough surface. The grip is somewhat wider than its vertical thickness when held in the usual way, and it diminishes gradually from shell to pommel for convenience of holding. It should have a slight lateral curvature, so that in executing circular movements the pommel is kept clear of the wrist. The pommel, usually of steel, is roughly spherical or eight-sided, and serves as a counterbalance. The end of the haft is riveted through it, except in the case of "épées démontables," which are the most convenient, as a blade may be changed by simply unscrewing or unlocking the pommel.

An épée is well balanced and light in hand when, on poising the blade across the forefinger, about 1 in. in advance of the shell, it is in equilibrium.
For practice, the point is blunted to resemble the flat head of a nail, and is made still more incapable of penetration by winding around it a small ball of waxed thread, such as cobblers use. This is called the "button." In competitions various forms of "boules marmourets," all of which are unsatisfactory, are occasionally used. The "pointe d'arrêt," like a small in-tack plug, is fixed on the point of the blade, or fastened on by means of the waxed thread, is, on the contrary, most useful, by fixing in the clothes, to show where and when a good hit has been made. The point need only protrude about 1/10 of an inch from the button. There are several kinds of points d'arrêt. The best is called, after its inventor, the "Léon Sazli," and has three blunt points of hardened steel each slightly eccentric. The single point is sometimes prevented by the thickness of the button from scoring a good hit.

A mask of wire netting is used to protect the face, and a stout glove on the sword-hand. It is necessary to wear strong clothes and to pad the jacket and trousers at the most exposed parts, in case the blade should break unnoticed. A vulnerable spot, which ought to be specially padded, is just under the sword-arm.

Biography.—Among the older works on the history and practice of the small-sword, or épée, are the following:—The Scots Fencing-Master, or Compleat Small-swordman, by W. H. Gent (Sir William Hope), Edinburgh, 1740; afterwards translated into French, with several other works, by the same author, of later date, for which see Schools and Masters of Fencing, by Egerton Castle; Nouveau traité de la perfection sur la faîte des armes, by P. G. F. Girard (Paris, 1756); L'Art du Duelliste, by M. Angelo (London, 1673); L'Art du Duelliste, by M. Danet (2 vols., Paris, 1766-1767); Nouveau traité de l'art des armes, by Nicolas Demesne (Liége, 1778). More modern art: Traité de l'art des armes, by La Bessières, Jr. (Paris, 1818); Les Armes et le duc, by A. Grisier (2nd ed., Paris, 1847); Les Secrets de l'épée, by the baron de Bazancourt (Paris, 1862); Schools and Masters of Fencing, by Egerton Castle (London, 1862); Le Duelliste, by J. André (Paris, 1887); L'Exercice pratiqué au XIXe siècle, by Ambroise Baudry (Paris); L'Exercice de l'épée, by A. Spinewyn and Paul Manony (Paris, 1895); The Sword and the Centuries, by Captain Hutton (London, 1901); Revival of the Small-sword, by C. Newton-Robinson, in the Nineteenth Century and After (London, January 1905); Nouveau Traité de l'épée, by Dr Edom, privately published (Paris, 1908); and, most important of all, Méthode d'exercice à l'épée, by J. Joseph-Renaud, privately published (Paris, 1909).

Eperjes, a town of Hungary, capital of the county of Sáros, 100 m. N.E. of Budapest by rail. Pop. (1900) 13,008. It is situated on the left bank of the river Tárca, an affluent of the Tisza, and has been almost completely rebuilt since a great fire in 1885. Eperjes is one of the oldest towns of Hungary, and is still marked by the old walls. It is the seat of a Greek-Catholic bishop, and possesses a beautiful cathedral built in the 18th century in late Gothic style. It possesses manufactures of cloth, table-linen and earthenware, and has an active trade in wine, linen, cattle and grain. About 2 m. to the south is Sóvár with important salt-works.

In the same county, 28 m. by rail N. of Eperjes, is situated the old town of Bátó, (pop. 6058), which possesses a Gothic church from the 14th century, and an interesting town-hall, dating from the 15th century, and containing very valuable archives. In its neighbourhood, surrounded by pine forests, are the baths of Bárány, with twelve mineral springs—iodate, ferruginous and alkaline—used for bathing and drinking.

About 6 m. N.W. of Eperjes is situated the village of Vörös-vágás, which contains the only opal mine in Europe. The opal was mined here 800 years ago, and the largest piece hitherto found, weighing 2040 carats and estimated to have a value of £17,500, is preserved in the Court Museum at Vienna.

Eperjes was founded about the middle of the 12th century by a German colony, and was elevated to the rank of a royal free town in 1347 by Louis I. (the Great). It was afterwards fortified and received special privileges. The Reformation found many early adherents here, and the town played an important part during the religious wars of the 17th century. It became famous by the so-called "butchery of Eperjes," a tribunal instituted by the Austrian general Caraffa in 1687, which condemned to death and confiscated the property of a great number of citizens accused of Protestantism. During the 16th and the 17th centuries its German educational establishments enjoyed a wide reputation.

Épinal, a town of northern France, capital of an arrondissement in the department of Meuse, 88 m. E.N.E. of Paris on the main line of the Eastern railway to Châlons-sur-Marne. Pop. (1906) 20,241. The town is situated on the left bank of the Meuse at the extremity of the pretty valley of the Cubry, by which it is traversed. In the central and oldest quarter the streets are narrow and irregular; the surrounding suburbs are modern and more spacious, and that of La Folie, on the east, contains many handsome villas belonging to rich wine merchants. The town has also extended to the right bank of the Meuse. One of its churches preserves a portrait and stained glass windows of the 16th century, but the other public buildings are modern. Épinal is best known as the principal entrepôt of the Champagne wines, which are bottled and kept in extensive vaults in the chalk rock on which the town is built. The manufacture of the apparatus and material used in the champagne industry occupies many hands, and the Eastern Railway Company has important workshops here. Brewing, and the manufacture of sugar, are also carried on. Épinal is the seat of a sub-prefecture and has tribunals of first instance and of commerce, and communal colleges for girls and boys. Épinal (Spinacum) belonged to the archbishops of Reims from the 5th to the 10th century, at which period it came into the possession of the counts of Champagne. It suffered severely during the Hundred Years' War, and was burned by Francis I. in 1544. It resisted Henry of Navarre in 1592, and Marshal Biron fell in the attack which preceded its capture. In 1642 it was, along with Château-Thierry, erected into a duchy and assigned to the duke of Bouillon.

Épernon, a town of northern France in the department of Eure-et-Loir, at the confluence of the Drouette and the Guese, 17 m. N.E. of Chartres by rail. Pop. (1906) 2370. It belonged originally to the counts of Montfort, who, in the 11th century, built a castle here of which the ruins are still left, and granted a charter to the town. In the 13th century it became an independent lordship, which remained attached to the crown of Navarre till, in the 16th century, it was sold by King Henry (afterwards King Henry IV. of France) to Jean Louis de Nogaret, for whom it was raised to the rank of a duchy in 1581. The new duke of Épernon was one of the favourites of Henry III., who were called les Mignons; the king showered favours upon him, giving him the posts of colonel-general in the infantry and of admiral of the fleet. Under the reign of Henry IV., he made himself practically independent in his government of Provence. He was instrumental in giving the regency to Marie de' Medici in 1610, and as a result exercised a considerable influence upon the government. During his governorship of Guienne in 1622 he had some scandalous scenes with the parlement and the archbishop of Bordeaux. He died in 1642. His eldest son, Henri de Nogaret de la Valette, duke of Candale, served under Richelieu, in the armies of Guienne, of Picardy and of Italy. The second son of Jean Louis de Nogaret, Bernard, who was born in 1592, and died in 1665, was, like his father, duke of Épernay, colonel-general in the infantry and governor of Guienne. After his death, the title of duke of Épernay was borne by the families of Goth and of Pardaillan.

Ephebeum (from Gr. ἐφέβος, a young man), in architecture, a large hall in the ancient Palaestra furnished with seats (Vitruvius v. 11), the length of which should be a third larger than the width. It served for the exercises of youths of from sixteen to eighteen years of age.

Ephebi (Gr. ἐφέβοι, and ἐφήβοι, i.e. "those who have reached puberty"), a name specially given, in Athens and other Greek towns, to a class of young men from eighteen to twenty years of age, who formed a sort of college under state control. On the completion of his seventeenth year the Athenian youth attained his civil majority, and, provided he belonged to the first three property classes and passed the scrutiny (δοκοπαρία) as to age,
civic descent and physical capability, was enrolled on the register of his deme (παλαιοκή πλοιαρχία, πλοιαρχία). He thereby at once became liable to the military training and duties, which, at least in the earliest times, were the main object of the Ephesia. In the time of Aristotle the name of the enrolled ephesia was engraved on a bronze pillar (formerly on wooden tablets) in front of the council-chamber. After admission to the college, the ephesia took the oath of allegiance, recorded in Pollux and Stobaeus (not but in Aristotle), in the temple of Aglauros, and was sent to Munychia or Acte to form one of the garrison. At the end of the first year of training, the ephesia were reviewed, and, if their performance was satisfactory, were provided by the state with a spear and a shield, which, together with the χίλιμανα (longer or shorter sword, hat), made up their equipment. In their second year they were transferred to other garrisons in Attica, patrolled the frontiers, and on occasion took an active part in war. During these two years they were free from taxation, and were not allowed (except in certain cases) to appear in the law courts as plaintiffs or defendants. The ephesia took part in some of the most important Athenian festivals. Thus during the Eleusinia they were told off to fetch the sacred oaks from Marathon and to escort the image of Iacchus on the sacred way. They also performed police duty at the meetings of the ecclesia.

After the end of the 4th century B.C. the institution underwent a radical change. Enrolment ceased to be obligatory, lasted only for a year, and the limit of age was dispensed with. Inscriptions attest a continually decreasing number of ephesia, and with the admission of foreigners the college lost its representative national character. This was mainly due to the weakening of the military spirit and the progress of intellectual culture. The military element was no longer all-important, and the ephesia became a sort of university for well-to-do young men of good family, whose social position has been compared with that of the Athenian "knights" of earlier times. The institution lasted till the end of the 3rd century A.D.

It is probable that the ephesia was in existence in the 5th century B.C., and controlled by the Areopagus and strategus as its moral and military supervisors. In the 4th century their place was taken by ten sophronioi (one for each tribe), who, as the name implies, took special interest in the morals of those under them, their military training being in the hands of experts, of whom the chief were the haplogramous, the acontistai, the tachetai and the aphetes (instructors respectively in the use of arms, javelin-throwing, archery and the use of artillery engines). Later, the sophronioi were superseded by a single official called krateiai, elected for a year by the people, who appointed the instructors. When the ephesia instead of a military college became a university, the military instructors were replaced by philosophers, rhetoricians, grammarians and artists. In Roman imperial times several new officials were introduced, one of special importance being the director of the Diogeneion, where youths under age were trained for the ephesia. At this period the college of ephesia was a miniature city; its members called themselves "citizens," and it possessed an archon, strategus, herald and other officials, after the model of ancient Athens.

There is an extensive class of inscriptions, ranging from the 3rd century B.C. to the 3rd century A.D., containing decrees relating to the ephesia, their officers and instructors, and lists of the same, and a whole chapter (49) of the Aristotelian Constitution of Athens is devoted to the subject. The most important treatises on the subject are: W. Dittenberger, De ephesia Aticis (Göttingen, 1863); A. Dumont, Essai sur l'éphèbe attique (1879-1870); L. Gräf, Die Erhebung und Untertanen im klassischen Alterthum, iii (Würzburg, 1881); J. P. Mahaffy, Old Greek Education (1881); P. Girard, L'Éducation au Grec ancien au V et IVe siècle avant J.-C. (2nd ed., 1881); and an article of Dittenberger and Sage's Geschichte der alphabetschriften, which contains further bibliographical references; G. Gilbert, The Constitutional Antiquities of Athens (Eng. tr., 1895); G. Busolt, Die Religions- und Reichsgeschichte (1892); K. I. Martens and J. Ohler in Pauly-Wissowa, Realencyclopädie der klassischen Altertumswissenschaft, v. pt. 2 (1903); W. W. Capes, University Life in Ancient Athens (1877).

 Ephesia, de (Greek for a "diary"), a table giving for stated times the apparent position and other numerical particulars relating to a heavenly body. The Astronomical Ephemeris, familiarly known as the "Nautical Almanac," is a national annual publication containing ephemerides of the principal or more conspicuous heavenly bodies, elements and other data of eclipses, and other matters useful to the astronomer and navigator. The governments of the United Kingdom, the United States, France, Germany and Spain publish such annals.

EPHESIANS, EPISTLE TO THE. This book of the New Testament, the most general and least occasional and polemic of all the Pauline epistles, a large section of which seems almost like the literary elaboration of a theological topic, may best be described as a solemn oration, addressed to absent hearers, and intended not primarily to clarify their minds but to stir their emotions. It is thus a singularly mingled piece of rhetoric, reflecting on the nature not of an essay but a poem. Ephesians has been called "the crown of St Paul's writings," and whether it is measured by its theological or its literary interest and importance, it can fairly dispute with Romans the claim to be his greatest epistle. In the public and private use of Christians some parts of Ephesians have been among the most favourite of all New Testament passages. Like its sister Epistle to the Colossians, it can tarry in the home, whoever wrote it, deep with experience and bold use of reflection on the meaning of that experience; if it be from the pen of the Apostle Paul, it reveals to us a distinct and important phase of his thought.

To the nature of the epistle correspond well the facts of its title and address. The title "To the Ephesians" is found in the Muratorian canon, in Irenaeus, Tertullian and Clement of Alexandria, as well as in all the earliest MSS. and versions. Marcion, however (c. A.D. 150), used and recommended copies with the title "To the Laodiceans." This would be inexplicable if Eph. i.1 had read in Marcion's copies, as it does in most ancient authorities, "To the saints which are at Ephesus;" but in fact the words to Ephes for verse x were probably absent. They were not contained in the text used by Origen (d. 253); Basil (d. 379) says that "ancient copies" omitted the words; and they are actually omitted by Codices B (Vatican) and w (Sinaiticus, 4th century), together with Codex 07 (11th century). The words in Ephesians were thus probably originally lacking in the address, and were inserted from the suggestion of the title. Either the address was general ("to the saints who are also faithful") or else a blank was left. In the latter case the name may have been intended to be supplied orally, in communicating the letter, or a different name may have been written in each of the individual copies. Under any of these hypotheses the address would indicate that we have a single letter, written to a group of churches, doubtless in Asia Minor. This would account both for the collective form of the epistle, as well as for the entire and striking absence of personal greetings and of concrete allusions to existing circumstances among the readers. It appears to have drawn its title, "To the Ephesians," from one of the churches for which it was intended, perhaps the one from which a copy was secured when Paul's epistles were collected, shortly before or after the year 100. That our epistle is the one referred to in Col. iv. 16, which was to be had by the Colossians from Laodicea, is not unlikely. Such an identification doubtless led Marcion to alter the title in his copies.

The structure of Ephesians is epistolary; it opens with the usual salutation (i.1-2) and closes with a brief personal note and formal farewell (vi.21-24). In the intervening body of the epistle the writer also follows the regular form of a letter. In an ordinary Greek letter (as the papyri show) we should find the salutation followed by an expression of gratification over the correspondent's good health and of prayer for its continuance. Paul habitually expanded and deepened this, and, in this case, that paragraph is enormously enlarged, so that it may be regarded as including chapters i.iii., and as carrying the main thought of the epistle. Chapters iv.-vi. merely make application of the main ideas worked out in chapters i.-iii. Throughout the epistle we have a singular combination of the seemingly desultory method of a letter, turning aside at a word and straying wherever
the mood of the moment leads, with the firm, forward march of earnest and mature thought. In this combination resides the doubtless unconscious but nevertheless real literary art of the composition.

The fundamental theme of the epistle is *The Unity of Mankind in Christ*, and hence the Unity and Divinity of the Church of Christ. God’s purpose from eternity was to unite mankind in Christ, and so to bring human history to its goal, the New Man, the measure of the stature of the fulness of Christ. Those who have believed in Christ are the present representatives and result of the union by a clear knowledge of the purpose itself, the secret of the ages, has now been revealed to men. This theme is not formally discussed, as in a theological treatise, but is rather, as it were, celebrated in lofty eulogy and application. First, in chapters i.-iii., under the mask of a conventional congratulatory paragraph, the writer declares at length the privileges which this great fact confers upon those who by faith receive the gift of God, and he is thus able to touch on the various aspects of his subject. Then, in chapters iv.-vi., he turns, with a characteristic and impressive "therefore," to set forth the obligations which correspond to the privileges he has just expounded. This author is indeed intended to procure vigorous and substantial thinking, but the mainspring of his interest is the conviction that such thought is significant for inner and outer life.

The relationship, both literary and theological, between the epistle to the *Ephesians* and that to the *Colossians* (g.v.) is very close. It is to be seen in many of the prominent themes of resemblance, especially in the developed view of the central position of Christ in the whole universe; in the conception of the Church as Christ’s body, of which He is the head; in the thought of the great Mystery, once secret, now revealed. There is further resemblance in the formal moral code, arranged by classes of persons, and having much the same contents in the two epistles (Eph. v. 22-vi. 9; Col. iii. 18-iv. 1). In both, also, Tychicus carries the letter, and in almost identical language the readers are told that he will by word of mouth give fuller information about the apostle’s affairs (Eph. vi. 21-22; Col. iv. 7-8). Moreover, in a great number of characteristic phrases and even whole verses the two are alike. Compare, for instance, Eph. i. 7, Col. i. 14; Eph. i. 10, Col. i. 20; Eph. i. 21, Col. i. 16; Eph. i. 22, 23, Col. i. 18, 19; Eph. ii. 5, Col. ii. 13; Eph. i. 11, Col. i. 11; Eph. ii. 16, Col. i. 20; Eph. iii. 2, 3, Col. i. 25, 26, and many other parallels. Only a comparison in detail will give a true impression of the extraordinary degree of resemblance. Yet the two epistles do not follow the same course of thought, and their contents cannot be successfully exhibited in a common synoptical abstract. Each has its independent occasion, purpose, character and method; but they draw largely on a common store of thought and use common means of expression.

The question of the authorship of *Ephesians* is less important to the student of the history of Christian thought than in the case of most of the Pauline epistles, because of the generality of tone and the lack of specific allusion in the work. It purports to be by Paul, and was held to be his by Marcion and in the Muratorian canon, and by Irenæus, Tertullian and Clement of Alexandria, all writing at the end of the 2nd century. No doubt of the Pauline authorship was expressed in ancient times; nor is there any lack of early use by writers who make no direct quotation, to raise doubts as to the genuineness of the epistle. The influence of the language is probably to be seen in Ignatius, but no依据 in *Hebrews*, less certainly in the epistle of Barnabas. Some resemblances of expression in Clement of Rome and in Second Clement may have significance. There is here abundant proof that the epistle was in existence, and was highly valued and influential with leaders of Christian thought, about the year 100, when persons who had known Paul well were still living.

To the evidence given above may be added the use of *Ephesians* in the First Epistle of Peter. If the latter epistle could be finally established as genuine, or its date fixed, it would give important evidence with regard to *Ephesians*; but in the present state of discussion we must confine ourselves to pointing out the fact. Some of the more striking points of contact are the following: Eph. i. 3, 1 Peter i. 3; Eph. i. 20, 21, 25, 26; Eph. ii. 2, 3, iv. 17, 1 Peter iv. 3; Eph. ii. 21, 22, 1 Peter ii. 5; Eph. v. 22, 1 Peter iii. 1, 2; Eph. v. 25, 1 Peter iii. 7, 8; Eph. vi. 5, 1 Peter ii. 18, 19. A similar relation exists between *Romans* and *1 Peter*. In both cases the dependence is clearly on the part of 1 Peter; for ideas and phrases that in *Ephesians* and *Romans* have their firm place in closely wrought sequences, are found in 1 Peter with less profound significance and transformed into smoother and pointed maxims and apologetic sentences.

Objections to the genuineness of *Ephesians* have been urged since the early part of the 19th century. The influence of Schleiermacher, whose pupil Leonhard Usteri in his *Entwicklung der paulinischen Lehrbegriffe* (1824) expressed strong doubts as to *Ephesians*, carried weight. He held that Tychicus was the author. De Wette first (1826) doubted, then (1843) denied that the epistle was by Paul. The chief attack came, however, from Baur (1845) and his colleagues of the Tübingen school. Against the genuineness of the authorship have appeared Ewald, Renan, Haurath, Hilgenfeld, Ritschl, Pfeiderer, Weizäcker, Holtzmans, von Soden, Schmiedel, von Dobschütz and many others. On the other hand, the epistle has been defended by Bleek, Neander, Reuss, B. Weiss, Meyer, Sabatier, Lightfoot, Hort, Sanday, Bacon, Jülicher, Harnack, Zahn and many others. In recent years a tendency has been apparent among critics to accept *Ephesians* as a genuine work of Paul. This has followed the second form of the interpretation of the epistle.

Before speaking of the more fundamental grounds urged for the rejection of *Ephesians*, we may look at various points of detail which are of less significance.

(1) The style is unquestionably a slow and lumbering movement, in marked contrast with the quick effectiveness of *Romans* and *Galatians*. The sentences are much longer and less vivacious, as any one can see by a superficial examination. But nevertheless there are parts of the earlier epistles where the same tendency appears (e.g. Rom. iii. 23-26), and on the whole the style shows Paul’s familiar traits. (2) The vocabulary is said to be peculiar. But it can be shown to be no more so than that of *Galatians* (Zahn, *Einleitung*, i. pp. 365 ff.). On the other hand, some words characteristic of Paul’s use appear (notably ἄδεια, five times), and the most recent and careful investigation of Paul’s vocabulary (Nagel, *Wortersch. der paulinischen Briebe*, 1905) concludes that the evidence speaks for Paul. Certain phrases have aroused suspicion, for instance, “the devil” (vi. 11, instead of Paul’s usual term “Satan”), “his holy apostles and prophets” (iii. 5, as smacking of later fusionsense); “I Paul” (iii. 1); “unto me, who am less than the least of all the saints” (iii. 8, as exaggerated). But these cases, when properly understood and calmly viewed, do not carry conviction against the epistle. (4) The relation of *Ephesians* to *Colossians* would be a serious difficulty only if *Colossians* were held to be not by Paul. Those who hold to the genuineness of *Colossians* find it easier to explain the resemblances as the product of the free working of the same mind, than as due to a deliberate imitator. Holtzmann’s elaborate and very ingenious theory (1872) that *Colossians* has been expanded, on the basis of a shorter letter of Paul, by the same later hand which had previously written the whole of *Ephesians*, has not met with favour from recent scholars. But the more serious difficulties which to many minds still stand in the way of the acceptance of the epistle have come from the developed phase of Pauline theology which it shows, and from the general background and atmosphere of the underlying system of thought, in which the absence of the well-known earlier controversies is remarkable, while some things suggest the thought of John and a later age. Among the most important points in which the ideas and implications of *Ephesians* suggest an authorship and a period other than that of Paul are the following: (a) The union of Gentiles and Jews in one body is already accomplished. (b) The Christology is more advanced, uses
Alexandrian terms, and suggests the ideas of the Gospel of John. (c) The conception of the Church as the body of Christ is new. (d) There is said to be a general softening of Pauline thought in the direction of the Christianity of the 2nd century, while very many characteristic ideas of the earlier epistles are absent.

With regard to the change of affairs in the Church, it must be said that this can be a conscious argument of the Paulinist, who holds the view of the Tübingen scholars, that the Apostolic Age was all of a piece and was dominated solely by one controversy. The change in the situation is surely not greater than can be imagined within the lifetime of Paul. That the epistle implies as already existent a developed system of Gnostic thought such as only came into being in the 2nd century is not true, and such an idea is excluded by the external evidence. As to the other points, the question is, whether the admittedly new phase of Paul's theological thought is so different from his earlier system as to be incompatible with it. In answering this question different minds will differ. But it must remain possible that contact with new scenes and persons, and especially such controversial necessities as are exemplified in Colossians, stimulated Paul to work out more fully, under the influence of Alexandrian categories, lines of thought of which the germs and origins must be admitted to have been present in earlier epistles. It cannot be maintained that the ideas of Ephesians directly connect either in formulation or in tendency the thought of the earlier epistles. Moreover, if Colossians be accepted as Pauline (and among other strong reasons the unquestionable genuineness of the epistle to Philemon renders it extremely difficult not to accept it), the chief matters of this more advanced Christian thought are fully legitimated for Paul.

On the other hand, the characteristics of the thought in Ephesians give some strong evidence confirmatory of the epistle's own claim to be by Paul. (a) The writer of Eph. ii. 11-22 was a Jew, not less proud of his race than was the writer of Rom. ix.-xi. or of Phil. iii. 4 ff. (b) The centre in all the theology of the epistle is the idea of redemption. The use of Alexandrian categories is wholly governed by this interest. (c) The epistle shows the same panoramic, pictorial, dramatic conception of Christian truth which is everywhere characteristic of Paul. (d) The most fundamental elements in the system of thought do not differ from those of the earlier epistles.

The view which denies the Pauline authorship of Ephesians has to suppose the existence of a great literary artist and profound theologian, able to write an epistle worthy of Paul at his best, who, without betraying any recognizable motive, presented to the world in the name of Paul an imitation of Colossians, incredibly laborious and yet superior to the original in literary work, in power of thought, and beauty of expression, by H. von Soden (in Heinlpresse 1904; T. Zahn (1897-1899, 2nd ed. 1900); and in the thorough investigations of H. Holtzmann, Kritik der Epheser- und Kolossenser-Germaunie (1899), and F. J. A. Schürmann, Das Epheserbuch (1904). On early attestation see A. H. Charteris, Canonicity (1880) and the New Testament in the Apostolic Fathers (Oxford, 1905).

The theological ideas of Ephesians are also discussed in some of the works on Paul's theology; see especially J. F. Baur, Paulus (1845, 2nd ed. 1866-1867, Eng. trans. 1872-1874); O. Pfleiderer, Der Paulinismus (1873, 2nd ed. 1890, Eng. trans. 1877); and in the works on New Testament theology by E. Weiss (1868, 7th ed. 1903, Eng. trans. 1882-1883); H. Holtzmann (1897), and G. B. Stevens (1899). See also Sommerville, St Paul's Conception of Christ (1896).

Ephesus, an ancient Ionian city on the west coast of Asia Minor. In historic times it was situated on the lower slopes of the hills, Coressus and Prion, which rise out of a fertile plain near the mouth of the river Caýster, while the temple and precinct of Artemis and Diana, to the fame of which the town owed much of its celebrity, were in the plain itself, E.N.E. at a distance of about a mile. But there is reason to think both town and shrine had different sites in pre-Ionian times, and that both lay farther south among the foot-hills of Mt. Solimius. The situation of the city was such as at all times to command a great commerce. Of the three great river basins of Ionia and Lydia, those of the Hermus, Caýster and Maeander, it commanded the second, and had already access by easy passes to the other two.

The earliest inhabitants assigned to Ephesus by Greek writers are the "Amazons," with whom we hear of Leleges, Carians and Pelasgi. In the 11th century B.C., according to tradition (the date is probably too early), Androclus, son of the Athenian king Codrus, landed on the spot with his Ionians and a mixed army of Gallic and Etruscan and Illyrian mercenaries, under command of Cunshi, an Ionian from the history of the Greek priests. The deity of the city was Artemis; but we must guard against misconception when we use that name, remembering that she bore close relation to the primitive Asiatic goddess of nature, whose cult existed before the Ionian migration at the neighbouring Ortygia, and that she always remained the virgin-mother of all life and especially wild life, and an embodiment of the fertility and productive power of the earth. The well-known monstrous representation of her, as a figure with many breasts, swathed below the waist in grave-clothes, was probably of late and alien origin. In early Ionian times she seems to have been represented as a natural matronly figure, sometimes accompanied by a child, and to have been a more typically Hellenic goddess than she became in the Hellenistic and Roman periods.

Twice in the period 360-300 B.C. the city owed its preservation to a close interconference of the goddess; once when the swarms of the Cimmerians overran Asia Minor in the 7th century and burnt the Artemision itself; and once when Croesus besieged the town in the century succeeding, and only retired after it had solemnly dedicated itself to Artemis, the sign of such dedication being the stretching of a rope from city to sanctuary. Croesus was eager in every way to propitiate the goddess, and since about this time her temple was being restored on an enlarged scale, he presented most of the columns required for the building as well as some

Robinson (1903, 3rd ed. 1914); in German (1801; 2nd ed. 1873, H. (in Meyer's Kommentar) (8th ed. 1902); J. B. Lightfoot's commentary on Colossians (1875, 3rd ed. 1892), see also Sommerville, St Paul's Conception of Christ (1896) and A. C. G. Moule (in Cambridge Bible for Schools) (1887). R. W. Dale, Ephesien to the Ephesians; its Doctrine and Ethics (1882), is a valuable secondary exposition discussing important points.

Questions of genuineness, purpose, &c., are discussed in the New Testament Introductions of H. Holtzmann (1885, 3rd ed. 1892); B. Weiss (1886, 3rd ed. 1897, Eng. trans. 1887); G. Salmon (1887, 2nd ed. 1894); A. Jülicher (1875, 5th ed. 1897); T. Zahn (1887-1899, 2nd ed. 1900); and in the thorough investigations of H. Holtzmann, Kritik der Epheser- und Kolossenser-Germaunie (1899), and F. J. A. Schürmann, Das Epheserbuch (1894). See also Sommerville, St Paul's Conception of Christ (1896).

Ephesus, an ancient Ionian city on the west coast of Asia Minor. In historic times it was situated on the lower slopes of the hills, Coressus and Prion, which rise out of a fertile plain near the mouth of the river Caýster, while the temple and precinct of Artemis and Diana, to the fame of which the town owed much of its celebrity, were in the plain itself, E.N.E. at a distance of about a mile. But there is reason to think both town and shrine had different sites in pre-Ionian times, and that both lay farther south among the foot-hills of Mt. Solimius. The situation of the city was such as at all times to command a great commerce. Of the three great river basins of Ionia and Lydia, those of the Hermus, Caýster and Maeander, it commanded the second, and had already access by easy passes to the other two.

The earliest inhabitants assigned to Ephesus by Greek writers are the "Amazons," with whom we hear of Leleges, Carians and Pelasgi. In the 11th century B.C., according to tradition (the date is probably too early), Androclus, son of the Athenian king Codrus, landed on the spot with his Ionians and a mixed army of Gallic and Etruscan and Illyrian mercenaries, under command of Cunshi, an Ionian from the history of the Greek priests. The deity of the city was Artemis; but we must guard against misconception when we use that name, remembering that she bore close relation to the primitive Asiatic goddess of nature, whose cult existed before the Ionian migration at the neighbouring Ortygia, and that she always remained the virgin-mother of all life and especially wild life, and an embodiment of the fertility and productive power of the earth. The well-known monstrous representation of her, as a figure with many breasts, swathed below the waist in grave-clothes, was probably of late and alien origin. In early Ionian times she seems to have been represented as a natural matronly figure, sometimes accompanied by a child, and to have been a more typically Hellenic goddess than she became in the Hellenistic and Roman periods.

Twice in the period 360-300 B.C. the city owed its preservation to a close interconference of the goddess; once when the swarms of the Cimmerians overran Asia Minor in the 7th century and burnt the Artemision itself; and once when Croesus besieged the town in the century succeeding, and only retired after it had solemnly dedicated itself to Artemis, the sign of such dedication being the stretching of a rope from city to sanctuary. Croesus was eager in every way to propitiate the goddess, and since about this time her temple was being restored on an enlarged scale, he presented most of the columns required for the building as well as some
cows of gold. That is to say, these gifts were probably paid for out of the proceeds of the sequestration of the property of a rich Lydian merchant, Sadyattites, which Croesus presented to Ephesus (Nic. Damasc. fr. 63). To counteract, perhaps, the growing Lydian influence, Athens, the mother-city of Ephesus, despatched one of her noblest citizens, Aristarchus, to restore law on the basis of the Solonian constitution. The labours of Aristarchus seem to have borne fruit. It was an Ephesian follower of his, Hermodorus, who aided the Decemviri at Rome in their compilation of a system of law. And in the same generation Heraclitus, probably a descendant of Codrus, quitted his hereditary magistracy in order to devote himself to philosophy, in which his name became almost as great as that of any Greek. Poetry had long flourished at Ephesus. From very early times the Homeric poems found a home and admirers there; and to Ephesus belong the earliest epic poems of Greece, the war songs of Callinus, who flourished in the 7th century b.c. and was the model of Tyrtaeus. The city seems to have been more than once under tyrannical rule in the early Ionian period; and it fell thereafter first to Croesus of Lydia, and then to Cyrus, the Persian, and when the Ionian revolt against Persia broke out in the year 500 b.c. under the lead of Miletus, the city remained subversive to Persian rule. When Xerxes returned from the march against Greece, he honoured the temple of Artemis, although he had sacked other Ionian shrines, and even left his children behind at Ephesus for safety's sake. We hear again of Persian respect for the temple in the time of Tissaphernes (411 B.C.). After the final Persian defeat at the Eurymedon (406 B.C.), Ephesus for a time paid tribute to Athens, with the other cities of the coast, and Lysander first and Agesilaus afterwards made it their headquarters. To the latter fact we owe a contemporary description of it by Xenophon. In the early part of the 4th century it fell again under Persian influence, and was administered by an oligarchy. Alexander was received by the Ephesians in 334, and established democratic government. Soon after his death the city fell into the hands of Lysimachus, who introduced fresh Greek colonists from Lebedus and Colophon and, it is said, by means of an artificial inundation compelled those who still dwelt in the plain by the temple to migrate to the city on the hills, which he surrounded by a solid wall. He renamed the city after his wife Arsinoë, but the old name was soon resumed. Ephesus was very prosperous during the Hellenistic period, and is conspicuous both then and later for the abundance of its coinage, which gives us a more complete list of magistrates' names than we have for any other Ionian city. The Roman coinage is remarkable for the great variety and importance of its types. After the defeat of Antiochus the Great, King of Syria, by the Romans, Ephesus was barred over by the conquerors to Eumenes, son of Prusias of Pergamum, whose successor, Attalus Philadephus, unintentionally worked the city irremediable harm. Thinking that the shallowness of the harbour was due to the width of its mouth, he built a mole part-way across the latter; the result, however, was that the silting up of the harbour proceeded much more rapidly than before. The third Attalus of Pergamum bequeathed Ephesus with the rest of his possessions to the Roman people, and it became for a while the chief city, and for longer the first port, of Asia. Ephesus, the richest city, therefore, of the Ionian league, Ephesus remained subject to the Romans, save for a short period, when, at the instigation of Mithradates Eupator of Pontus, the cities of Asia Minor revolted and massacred their Roman residents. The Ephesians even dragged out and slew those Romans who had fled to the precinct of Artemis for protection, notwithstanding which sacrilege they soon returned from their new to their former masters, and even had the effrontery to state, in an inscription, its preservation. When, however, Mithradates was a mere yielding to superior force. Sulla, after his victory over Mithradates, brushed away their pretexts, and inflicting a very heavy fine told them that the punishment fell far short of their deserts. In the civil wars of the 1st century B.C. the Ephesians twice supported the unsuccessful party, giving shelter to, or being made use of by, first, Brutus and Cassius, and afterwards Antony, for which partisanship or weakness they paid very heavily in fines.

All this time the city was gradually growing in wealth and in devotion to the service of Artemis. The story of St. Paul's doings there illustrates this fact, and the sequel is very suggestive,—"the burning, namely, of books of sorcery of great value. Addiction to the practice of occult arts had evidently become general in the now semi-Christianized city. The Christian Church which Paul planted there was governed by Timothy and John, and is famous in Christian tradition as a nurse of saints and martyrs. According to local belief, Ephesus was also the last home of the Virgin, who was lodged near the city by St. John and there died. But to judge from the Apocryphal Letter to this Church (as shown by Sir W. M. Ramsay), the latter showed a dangerous tendency to lightness and reaction, and later events show that the pagan tradition of Artemis continued very strong and perhaps never became quite extinct in the Ephesian district. It was, indeed, long before the spread of Christianity threatened the old local cult. The city was proud to be termed neocorus or servant of the goddess. Roman emperors vied with wealthy natives in lavish gifts, one Vibia Salutaris among the latter presenting a quantity of gold and silver images to be carried annually in procession. Ephesus contested stoutly with Smyrna and Pergamum the honour of being called the first city of Asia; the latter appealed to Rome, and we still possess remains of which the emperors endeavoured to mitigate the bitterness of the rivalry. One privilege Ephesus secured; the Roman governor of Asia always landed and first assumed office there; and it was long the provincial centre of the official cult of the emperor, and seat of the Asiarch. The Goths destroyed both city and temple in the year A.D. 392, and although the city revived and the cult of Artemis continued, neither ever recovered its former splendour. A general council of the Christian Church was held there in 431 in the great double church of St Mary, which is still to be seen. On this occasion Nestorius was condemned, and the honour of the Virgin established as Theotokos, amid great popular rejoicing, due, doubtless, in some measure to the hold which the cult of the virgin Artemis still had on the city. (On this council see below.) Theretofore Ephesus seems to have been gradually deserted owing to its malaria; and life transferred itself to another and higher site near the Artemision, the name of which, Ayassoluk (written by early Arab geographers Ayashurukh), is now known to be a corruption of the title of St John Theologos, given to a great cathedral built on a rocky hill near the present railway station, in the time of Justinian I. This church was visited by Ibn Batuta in A.D. 1333; but few traces are now visible. The ruins of the Artemision, after serving as a quarry to local builders, were finally covered deep with muck. On its left it lies the site of the P yap Temple of Artemision and the Magnetes, on its left the Caicus, one of its tributaries, the Selinus, and the true site remained unsuspected until 1869.

Excavations.—The first light thrown on the topography of Ephesus was due to the excavations conducted by the architect, J. T. Wood, on behalf of the trustees of the British Museum, during the years 1863–1874. He first explored the Odeum and the Great Theatre situate in the city itself, and in the latter place had the good fortune to find an inscription which indicated to him in what direction to search for the Artemision; for it was there that the processions came in from the city from the temple by the Magnesian gate and returned by the Coressian. These two gates were next identified, and following up that road which issued from the Magnesian gate, Wood lighted first on a ruin which he believed to be the tomb of Androclus, and afterwards on an angle of the peribolus wall of the time of Augustus. After further tentative explorations, he struck the actual pavement of the Artemision on the last day of 1869. The bed of the Caicus had removed the whole stratum of superficial deposit, nearly 20 ft. deep, which overlay the huge area of the temple, and exposed to view not only the scanty remains of the latest edifice, built after 350 B.C., but the platform of an earlier temple, now known to be that of the 6th century to which Croesus contributed. Below this he did not find any remains. He discovered and sent to England parts of several
sculptured drums (columnae cacatiae) of the latest temple, and archaic sculptures from the drums and parapet of the earlier building. He also made accurate measurements and a plan of the Hellenistic temple, found many inscriptions and a few miscellaneous antiquities, and had begun to explore the Precinct, when the great expense and other considerations induced the trustees of the British Museum to suspend his operations in 1874. Wood made two subsequent attempts to resume work, but failed; and the site lay desolate till 1904, when the trustees, wishing to have further information about the earlier strata and the Precinct, sent D. G. Hogarth to re-examine the remains. As a result of six months’ work, Wood’s “earliest temple” was recleared and planned, remains of three earlier shrines were found beneath it, a rich deposit of offerings, &c., belonging to the earliest shrine was discovered, and tentative explorations were made in the Precinct. This deep digging, however, which reached the sand of the original marl, released much ground water and resulted in the permanent flooding of the site.

The history of the Artemision, as far as it can be inferred from the remains, is as follows. (1) There was no temple on the plain previous to the Ionian occupation, the primeval seat of the nature-goddess having been in the southern hills, at Ortygia (near mod. Arvadis). Towards the end of the 8th century B.C. a small temple existed in the plain. This was little more than a small platform of green schist with a sacred tree and an altar, and perhaps later a wooden icon (image), the whole enclosed in a temenos: but, as is proved by a great treasure of objects in precious and other metals, ivory, bone, crystal, paste, glass, terra-cotta and other materials, found in 1904-1905, partly within the platform on which the cult-statue stood and partly outside, in the lowest stratum of deposit, this early shrine was presently enriched by Greeks with many and splendid offerings of Hellenic workmanship. A large number of electrum coins, found among these offerings, and in style the earliest of their class known, combine with other evidence to date the whole treasure to a period considerably anterior to the reign of Croesus. This treasure is now divided between the museums of Constantinople and London. (2) Within a short time, perhaps after the Cimmerian sack (? 650 B.C.), this shrine was restored, slightly enlarged, and raised in level, but not altered in character. (3) About the close of the century, for some reason not known, but possibly owing to collapse brought about by the marshy nature of the site, this was replaced by a temple of regular Hellenic form. The latter was built in relation to the earlier central statue-base but at a higher level than either of its predecessors, doubtless for dryness’ sake. Very little but its foundations were spared by later builders, and there is now no certain evidence of its architectural character; but it is very probable that the earlier temple in which the ionic order was used to have been first used, after the colonists had made use of Doric in their earlier constructions (e.g. in the Panionion); and that it was the work of the Cossian Chersiphron and his son, Metagenes, always regarded afterwards as the first builders of a regular Artemision. Their temple is said by Strabo to have been made bigger by another architect. (4) The latter’s work must have been the much larger temple, exposed by Wood, and usually known as the Archaic or Croesus temple. This overtops the other, and was at a level raised to about 7 m. N.E., near the modern Kos Bunar. The visible area of its cella alone contains the whole of the earlier shrines. Its central point, however, was still the primitive statue-base, now enlarged and heightened. About half its pavement, parts of the cella walls and of three columns of the peristyle, and the foundations of nearly all the platform, are still in position. The visible work was all of very fine white marble, quarried about 7 m. N.E., near the modern Kos Bunar. Fragments of relief-scenes belonging to the parapet and columns, and of fluted drums and capitals, cornices and other architectural members have been recovered, showing that the workmanship and Ionic style were of the highest excellence, and that the building presented a variety of ornament, rare among Hellenic temples. The whole ground-plan covered about 80,000 sq. ft. The height of the temple is doubtful, the measurements of columns given us by later authority having reference probably to its successor, the height of which was considered abnormal and marvellous. Judged by the diameter of the drums, the columns of the Croesus temple were not two-thirds of the height of those of the Hellenistic temple. This fourth temple is, beyond question, that to which Croesus contributed, and it was, therefore, in process of building about 540 B.C. Our authorities seem to be referring to it when they tell us that the Artemision was raised by common contribution of the great cities of Asia, and took 120 years to complete. It was dedicated with great ceremony, probably between 430 and 420 B.C., and the famous Timotheus, son of Thersander, carried off the magnificent prize for a lyric ode against all comers. Its original architects were, probably, Paeconius of Ephesus, and Demetrius, a native of the shrine itself: but it has been suggested that the latter may have been rather than the actual contracting builder than the architect. Of this second, Herodotus speaks as existing in his day; and unless weight be given to an isolated statement of Eusebius, that it was burnt about 395 B.C., we must assume that it survived until the night when one herostratus, desirous of acquiring eternal fame if only by a great crime, set it alight. This is said to have happened in 365 B.C. on the October night on which Alexander the Great came into the world, and, as Hesiod said, the goddess herself was absent, assisting at the birth; but, in the exactness of this portentous synchronism makes the Temple at Ephesus, conjecturally restored by date suspect. (5) It A. E. Henderson, was succeeded by what is called the Hellenistic temple, begun almost immediately after the catastrophe, according to plans drawn by the famous Dinocrates the architect of Alexandria. The building was on a higher level, some 7 ft. above that of the Archaic, by means of huge foundation blocks bedded upon the earlier structures; and this increase of elevation necessitated a slight expansion of the area all round, and ten steps in place of three. The new columns were of greater diameter than the old and over 60 ft. high; and from its great height the whole structure was regarded as a marvel, and accounted one of the wonders of the world. Since, however, other Greek temples had colonnades hardly less high, and were of equal or greater area, it has been suggested that the Ephesian temple had some distinct element of grandiosity, no longer known to us—perhaps a lofty sculptured parapet or some imposing form of podium. Bede, in his treatise De sept. mir. mundi, describes a stupendous Sclerosis of several storeys; but his other descriptions are so fantastic that no credence can
be attached to this. The fifth temple was once more of Ionic order, but the finish and style of its details as attested by existing remains were inferior to those of its predecessor. The great sculptured drums and pedestals, now in the British Museum, belong to the lower part of certain of its columns: but nothing of its frieze or pediments (if it had any) has been recovered. Begun probably before 350 B.C., it was in building when Alexander came to Ephesus in 334 and offered to bear the cost of its completion. It was probably finished by the end of the century; for Pliny says that its great inscription records its existence for 400 years up to his time. It stood intact, except for very partial restorations, till A.D. 262 when it was sacked and burned by the Goths: but it appears to have been to some extent restored afterwards, and its cult doubtless survived till the Edict of Theodosius closed the pagan temples. Its material was then quarried extensively for the construction of the great cathedral of St John Theologos on the neighbouring hill (Ayasoluk), and a large Byzantine building (a church?) came into existence on the central part of its denuded site, but did not last long. Before the Ottoman conquest its remains were already buried under several feet of silt.

The organization of the temple hierarchy, and its customs and privileges, retained throughout an Asiatic character. The priestesses of the goddess were virgates (i.e. unwedded), and their priests were compelled to celibacy. The chief among the latter was the Persan named Megabius and the Greek titi, Neocardi. The latter doubtless was a priestess of a sacred tomb, as the dignity of religion. His official dress and spadonic appearance are probably revealed to us by a small ivory statuette found by D. G. Hogarth in 1905. Besides these there was a vast throng of dependents who lived by the temple and its services — theologi, who may have expounded sacred legends, hymnosi, who composed hymns in honour of the deity, and others, together with a great crowd of hieroi who performed more menial offices. The making of shrines and images of the goddess occupied many hands. To support this greedy mob offerings flowed in in a constant stream from votaries and from visitors, who contributed sometimes money, sometimes statues and works of art. These latter so accumulated that the temple became a rich museum, among the chief treasures of which were the figures of Amazons sculptured in competition by Phidias, Polyclitus, Cresilas and Phradmon, and the painting by Apelles of Alexander holding a thunderbolt. The temple was also richly endowed with lands, and possessed the fishery of the Selinumian lakes, with other large revenues. But perhaps the most important of all the privileges possessed by the goddess and her priests was that of asylyum. Fugitives from justice or vengeance who reached her precincts were perfectly safe from all pursuit and arrest. The boundaries of the space possessing such virtue were from time to time enlarged. Mitridates extended them to a bowshot from the temple in all directions, and Mark Antony imprudently allowed them to take in part of the city, which part thus became free of all law, and a haunt of thieves and villains. Augustus, while leaving the right of asylum untouched, diminished the space to which the privilege belonged, and built round it a wall, which still surrounds the ruins of the temple at the distance of about a quarter of a mile, bearing an inscription in Greek and Latin, which states that it was erected in the proconsulship of Asinius Gallus, out of the revenues of the temple. The right of asylum, however, had once more to be defended by a deputation sent to the emperor Tiberius. Besides being a place of worship, a museum and a sanctuary, the Ephesian temple was a great bank. Nowhere in Asia could money be more safely bestowed, and both kings and private persons placed their treasures under the guardianship of the goddess.

The City.—After Wood's superficial explorations, the city remained desolate till 1894, when the Austrian Archaeological Institute was given concession for excavation and began systematic work. This has continued regularly ever since, but has been carried down no farther than the imperial stratum. The main areas of operation have been: (1) The Great Theatre. The stage buildings, orchestra and lower parts of the cavea have been cleared. In the process considerable additions were made to Wood's find of sculptures in marble and bronze, and of inscriptions, including missing parts of the Vibiian Salutaris texts. This theatre has a peculiar interest as the scene of the tumult aroused by the mission of St Paul; but the existing remains represent a reconstruction carried out after his time. (2) The Hellenistic Agora, a huge square, surrounded by porticoes, lying S.W. of the theatre and having fine public halls on the S. It has yielded to the Austrians fine sculpture in marble and bronze, and many inscriptions, including many doors of the Roman Agora, with its large halls, lying N.W. of the theatre. Here were found many inscriptions of Roman date and some statuary. (3) A street running direct from the S.E. angle of the Hellenic Agora towards the Magnesian Gate. This was found to be lined with pedestals of honorific statues and to have on the west side a remarkable building, stated in an inscription to have been a library. The tomb of the founder, T. Julius Celsus, is hard by, and some fine Roman reliefs, which once decorated it, have been sent to Vienna. (5) A street running direct to the port from the theatre. This is of great breadth, and had a Horologion half-way down and fine porticoes and shops. It was known as the Arcadian after having been restored at a higher level than formerly by the emperor Arcadius (A.D. 395). It leaves on the right the great Thermae of Constantine, of which the Austrians have cleared out the south-east part. This huge pile used to be taken for a monument to Ephesus. Part of the quays and buildings round the port were exposed, after means had been taken to drain the upper part of the marsh. (6) The Double Church of the Virgin "Deipara" in the N.W. of the city, wherein the council of 431 was held. Here interesting inscriptions and Byzantine architectural remains were found. Besides these excavated monuments, the Stadion; the enceinte of fortifications erected by Lysimachus, which runs from the tower called the "Prison of St Paul," and right along the crests of the Bulbul (Prion) and Panajir heights; the round monument miscalled the "Tomb of St Luke;" and the Opisthopletrian gymnasium near the Magnesian Gate, are worthy of attention.

The work done by the Austrians enables a good idea to be obtained of the appearance presented by a great Graeco-Roman city of Asia in the last days of its prosperity. It may be realized better there than anywhere how much architectural splendour was concentrated in the public quarters. But the restriction of the clearance to the upper stratum of deposit has prevented the acquisition of much further knowledge. Both the Hellenistic and, still more, the original Ionian cities remain for the most part unexplored. It should, however, be added that very valuable topographical exploration has been carried out in the environs of Ephesus by members of the Austrian expedition, and that the Ephesian district is now mapped more satisfactorily than any other district of ancient interest in Asia Minor.

The Turkish village of Ayasoluk (the modern representative of Ephesus), more than a mile N.E. of the ancient city, has revived somewhat of recent years owing to the development of its fig gardens by the Aidin railway, which passes through the upper part of the plain. It is noteworthy for a splendid ruined mosque built by the Seldjuk, Isa Bey II., of Aidin, in 1375, which contains magnificent columns: for a castle, near which lie remains of the pendentives from the cupola of the great cathedral of St John, now deeply buried in its own ruins; and for an aqueduct, Turkish baths and mosque-tombs. There is a fair inn managed by the Aidin Railway company.

the doctrine of the person of Christ. The councils of Nicaea and Constantinople had asserted the full divinity and real humanity of Christ, without, however, defining the manner of their union. The attempt to solve the apparent incongruity of a perfect union of two complete and distinct natures in one person produced first Apollinarianism, which substituted the divine Logos for the human πάροιχος or σώματος of Jesus, thereby detracting from the completeness of his humanity; and then Nestorianism, which destroyed the unity of Christ's person by affirming that the divine Logos dwelt in the man Jesus as in a temple, and that the union of the two natures was only in respect of dignity, and further that Jesus was not personally born, inasmuch as the Logos could not have been born, to call Mary ἀρχαίως, "Godbearer," was absurd and blasphemous. The Alexandrians, led by Cyril, stood for the doctrine of the perfect union of two complete natures in one person, and made ἀρχαίως the shibboleth of orthodoxy. The theological controversy was intensified by the rivalry of the two patriarchates, Alexandria and Constantinople, for the primacy of the East. As bishop of Constantinople Nestorius naturally looked to the emperor for support, while Cyril turned to Rome. A Roman synod in 430 found Nestorius heretical and decreed his excommunica-
tion unless he should recant. Shortly afterwards an Alex-
drian synod condemned his doctrines in twelve anathemas, which only provoked counter-anathemas, The emperor now intervened and summoned a council, which met at Ephesus on the 22nd of June 431. Nestorius was present with an armed escort, but refused to attend the council on the ground that the patriarch of Alexandria (his friend) had not arrived. The council, nevertheless, proceeded to declare him excommunicate and deposed. When the Roman legates appeared they "examined and approved" the acts of the council, whether as if thereby giving them validity, or as if concurring with the council, is a question not easy to answer from the records. Cyril, the presi-
dent, apparently regarded the subscription of the legates as the acknowledgment of "canaical agreement" with the synod. The disturbances that followed the arrival of John, the patriarch of Antioch, are sufficiently described in the article NESTORIUS.

The emperor finally interposed to terminate that scandalous strife, banished Nestorius and dissolved the council. Ultimately he gave decision in favour of the orthodox. The council was generally received as ecumenical, even by the Antiochenes, and the differences between Cyril and John were adjusted (433) by a "Union Creed," which, however, did not prevent a recrudescence of theological controversy. See Mansi iv. pp. 567-1482, v. pp. 1-1023; Hardouin i. pp. 1301-1305; Helefe (2nd ed.) ii. pp. 141-247 (Eng. trans. iii. pp. 111-114); Pélissier, SS. Magni et Evang. Conc., Ephesii, primi et ii; 1866). - See also, Josephus, op. cit.; Egermann, in Origines, 1875; Wycliffe, Alte Aften sum Ephes. Conc. II. (Leipzig, 1904); also the articles NESTORIUS; CYRIL; THEODORE OF MOPSOUSTIA.

The so-called "Robber Synod" of Ephesus (Latrocinum Ephesinum) of 449, although wholly irregular and promptly repudiated by the church, may, nevertheless, not improperly be treated here. The archimandrite Eutyches (q.v.) having been deposed by his bishop, Flavianus of Constantinople, on account of his herodox doctrine of the person of Christ, had appealed to Dioscorus, the successor of Cyril in the see of Alexandria, who restored him and moved the emperor Theodosius II. to summon a council, which should "utterly destroy Nestorianism." Rome recognizing that she had more to fear from Alexandria, who restored him and moved from her traditional policy and sided with Constantinople, the council of 131 bishops assembled on the 8th of August 449, was completely dominated by Dioscorus. Eutyches was acquitted of heresy and reinstated, Flavianus and other bishops deposed, the Roman legates insulted, and all opposition was overborne by intimidation or actual violence. The death of Flavianus, which soon followed, was attributed to injuries received in this synod; but the proof of the charge leaves something to be desired.

The emperor confirmed the synod, but the Eastern Church was divided upon the question of accepting it, and Leo I. of Rome excommunicated Dioscorus, refused to recognize the successor of Flavianus and demanded a new and greater council. The death of Theodosius II. removed the main support of Dios-
corus, and cleared the way for the council of Chalcedon (q.v.), which deposed the Alexandrian and condemned Eutychianism.

(T. F. C.)

EPHOD, a Hebrew word (ephod) of uncertain meaning, retained by the translators of the Old Testament. In the post-exilic and post-exilic writings (5th century B.C. and later) the ephod forms part of the gorgeous ceremonial dress of the high-priest (see Ex. xxix. 5 sq. and especially Exclus. xlv. 7-13). It was a very richly decorated object of coloured threads interwoven with gold, worn outside the luxurious mantle or robe; it was kept in place by a girdle, and by shoulder-pieces (?), to which were attached brooches of onyx (fastened to the robe) and golden rings from which hung the "breastplate" (or rather pouch) containing the sacred lots, Urin and Thummim. The somewhat involved description in Ex. xxviii. 6 sqq., xxxix. 2 sqq. (see V. Ryssel's ed. of Dillmann's commentary on Ex.-Lev.) leaves it uncertain whether it covered the back, encircling the body like a kind of waistcoat, or only the front; at all events it was not a garment in the ordinary sense, and its association with the sacred lots indicates that the ephod was used for divination (cf. Num. xxvii. 21), and had become the distinguishing feature of the leading priestly line (cf. 1 Sam. ii. 28). But from other passages it seems that the ephod had thereby a familiar object whose use was by no means so restricted. Like the tabernacle (q.v.) it was part of the common stock of Hebrew cult; it is borne (rather than worn) by persons acting in a priestly character (Samuel at Shiloh, priests of Nob, David), it is part of the worship of individuals (Gideon at Ophrah), and is found in a private shrine with a lay attendant (Micaiah; Judg. xvii. 5; see, however, vv. 10-12). Nevertheless, while the prophetic teaching came to regard the ephod as contrary to the true worship of Yahweh, the priestly doctrine of the post-exilic age (when worship was withdrawn from the community at large to the recognized priest-
hood of Jerusalem) has retained it along with other remains of earlier usage, legalizing it, as it were, by confining it exclusively to the Aaronites.

An intricate historical problem is involved in the accept in the famous ephod, which the priest Abiathar brought in his hand when he fled from David and gave it to the high-priest of Nob (1 Sam. xxi. 9), and the presence of the priests at Nob is no less clearly regarded as the sequel of the presence of Shiloh. In 1 Samuel xxvi. 19 we find the transference of the sacred objects to David (cf. 2 Sam. i. 10), and henceforth he regularly inquires of Yahweh in his movements (1 Sam. xxviii. 9-12, xxiii. 7 sq.; cf. xxvii. 2. 4; 2 Sam. ii. 1, v. 19-23). It is probable that the writer (or writers) of 1 Samuel intended the ephod to be the ephod of the ephod of the line of Eli and Abiathar to the time when the Zadokite priests gained the supremacy (see Levites); but else-
where Abiathar is said to have borne the ark (1 Kings ii. 26; cf. 2 Sam. vii. 6), and this fluctuation is noteworthy by reason of the present confusion in the text of 1 Sam. xxiv. 18 (see commentaries). In one view, the ark in Kirjath-jearim was in non-Israelite hands (1 Sam. vii. 1 sq.); on the other, Saul's possession of the ark misleadingly implied the presumption that his sway extended over Judah and Israel, including those cities which otherwise appear to have been in the possession of the Philistines (1 Sam. xxvii. 7 sq.; cf. xxvii. 7 sq.) except some fundamental divergencies in the representations of the tradi-
tions of both David and Saul (q.v.), and there is indirect and

1 Cf. the phrase "ephod of prophecy" (Testament of Levi, viii. 2). The priestly apparatus of the post-exilic age retains several traces of old mystical symbolism and earlier cult, the meaning of which had not altogether been forgotten. With the dress a man may perhaps compare the apparel of the gods Marduk and Adad, for which see A. Jeremias, Das Aller Teut. in Lichte des Alten Orient, 2nd ed., figs. 33, 35, and pp. 162, 449.

2 The ordinary interpretation "linen ephod" (1 Sam. i. 18, xxii. 18; 2 Sam. vi. 14) is questioned by T. C. Foote in his useful monograph, Journ. Bib. Lit. xii. 2, 1909, pp. 3, 47. This writer also aptly compares the infant Samuel with the child who drew the lots at the temple of Fortuna at Praeneste (Cicerio, De divin. ii. 41, 86), and with the modern practice of employing innocent instruments of chance in lotteries (op. cit. pp. 29, 37).
independent evidence which makes 1 Kings ii. 26 not entirely isolated. Here it must suffice to remark that the ark, too, was also an object for divine worship: xx. 26-28; cf. 18. 23), and it is far from certain that the later records of the ark (which was too heavy to be borne by one), like those of the ephod, are valid for a later time. For the form of the earlier ephod the classical passage is 2 Sam. vi. 14, where David girt in (or with) a linen ephod dances before the ark at its entry into Jerusalem and incurs the unqualified contempt of his wife Michal, the daughter of Saul. Relying upon the known custom of performing certain observances in a practically, or even entirely, nude condition, it seems plausible to infer that the ephod was a scanty wrapping, perhaps a loin-cloth, and this view has found weighty support. On the other hand, the idea of contempt at the exposure of the person, to whatever extent, may not have been so prominent, especially if the custom were not unfamiliar, and it is possible that the sequel refers more particularly to grosser practices attending outbursts of religious enthusiasm.1

The favourite view that the ephod was also an image rests partly upon 1 Sam. xxi. 9, where Goliath's sword is wrapped in a cloth in the sanctuary of Nob behind the ephod. But it is equally natural to suppose that it hung on a nail in the wall, and accordingly the tradition of the sinlessness of words in the Septuagint, the possibility that the text read "ark" cannot be wholly ignored (see above; also G. F. Moore, Encyc. Bibb. col. 1307, n. 2). Again, in the story of Micah's shrine and the removal of the sacred objects and the Levite priest by the Danites, parallel narratives have been used: the graned and molten images of Judg. xvii. 2-4 corresponding to the ephod and teraphim of ver. 5. Throughout there is confusion in the use of these terms, and the finale refers only to the graned image of Dan (xvii. 30 sqq., see 1 Kings xii. 28 sqq.). But the combination of ephod and teraphim (as in Hos. iii. 4) is noteworthy, since the fact that the latter were images (1 Sam. xiii. 13; Gen. xxxi. 34) could be urged against the view that the former were of a similar character. Finally, according to Judg. viii. 27, Gideon made an ephod of gold, about 70 lb in weight, and "put it" in Ophrah. It is regarded as a departure from the worship of Yahweh, although the writer of ver. 33 (cf. also ver. 25) hardly shared this feeling; it was probably something once harmlessly associated with the cult of Yahweh (cf. Calp, Golden), and the term "ephod" may be a later word under the influence of the prophetic teaching referred to above. The present passage is the only one which appears to prove that the ephod was an image, and several writers, including Litz (Realencycl. J. prot. Theol. vol. v., s.v.), T. C. Foote (pp. 13-15) and A. MacEneilburg (Zeit. f. wissens. Theol., 1906, pp. 433 sqq.) find this interpretation unnecessary.

Archaeological evidence for objects of divination (see, e.g., the interesting details in Ohnefalsch-Richter, Kypros, the Bible and Homer, i. 447 sqq.), and parallels from the Oriental area, can be readily cited in support of any of the explanations of the ephod which have been offered, but naturally cannot prove the form which it actually took in Palestine. Since images were clothed, it could be supposed that the divider put on the god's apparel (cf. Encyc. Bibb. col. 1141); but they were also plated, and in either case the transference from a covering to the object covered is intelligible. If the ephod was a loin-cloth, its use as a receptacle and the known evolution of the article find useful analogies (Foote, p. 43 sqq., and Encyc. Bibb. col. 1734 [1]). Finally, if there is no decisive evidence for the view that it was an image (Judg. viii. 27), or that as a wrapping it formed the sole covering of the officiating agent (2 Sam. vii.), all that can safely be said is that it was certainly used in divination and presumably did not differ radically from the ephod of the post-exilic age.

The title of the highest magistrate of the ancient Spartan state. It is uncertain when the office was created and what was its original character. That it owed its institution to Lycurgus (Herod. i. 65; cf. Xen. Resp. Laced. viii. 3) is very improbable, and we may either regard it as an immemorial Dorian institution (with C. O. Müller, H. Gabriel, H. K. Stein, Ed. Meyer and others), or accept the tradition that it was founded during the first century of Spartan War, which necessitated a prolonged absence from Sparta on the part of both kings (Plato, Lact, iii. 652 a; Aristotle, Polit. v. 1. 13a 23; Plut. Cleomenes, 10; so G. Dum, G. Gilbert, A. H. J. Greenidge).

There is no evidence for the theory that originally the ephors were market inspectors; they seem rather to have had from the outset judicial or police functions. Gradually they extended their powers, aided by the jealousy between the royal houses, which made it almost impossible for the two kings to co-operate heartily, and from the 5th to the 3rd century they exercised a governing despotism which is usually called an ephorship. Cleomenes III. restored the royal power by murdering four of the ephors and abolishing the office, and though it was revived by Antigonus Doson after the battle of Sellasia, and existed at least down to Hadrian's reign (Sparta Museum Catalogue, introd. p. 10), it never regained its former power.

In historical times the ephors were five in number, the first of them giving his name to the year, like the eponymous archon at Athens. Where opinions were divided the majority prevailed. The ephors were elected annually, originally no doubt by the kings, later by the people, their term of office beginning with the new moon after the autumnal equinox, and they had an official residence (φωραίον) in the Agora. Every full citizen was eligible and no property qualification was required.

The ephors summoned and presided over meetings of the Gerousia and Apella, and formed the executive committee responsible for carrying out decrees. In their dealings with the kings they represented the supremacy of the people. There was a monthly exchange of oaths, the kings swearing to rule according to the laws, the ephors undertaking this condition to maintain the royal authority (Xen. Resp. Laced. 15. 7). They alone might remain seated in a king's presence, and had power to try and even to imprison a king, who must appear before them at the third summons. Two of them accompanied the army in the field, not interfering with the king's conduct of the campaign, but prepared, if need be, to bring him to trial on his return. The ephors, again, exercised a general right of law and custom and superintended the training of the young. They shared the criminal jurisdiction of the Gerousia and decided civil suits. The administration of taxation, the distribution of booty, and the regulation of the calendar also devolved upon them. They could actually put perioct to death without trial, if we may believe Isocrates (xii. 81), and were responsible for protecting the state against the helots, against whom they had declared war in 420 B.C. They were able to kill any whom they regarded as dangerous without violating religious scruples. Finally, the ephors were supreme in questions of foreign policy. They enforced, when necessary, the alien acts (πολιτεία), negotiated with foreign ambassadors, instructed generals, sent out expeditions under the guiding spirits of the Spartan confederacy.

See the constitutional histories of G. Gilbert (Eng. trans.), pp. 16. 65 (growing up, G. Budowit, p. 84, and Thompson, 24 sqq., cf. C. F. Schmoller, Eng. trans.), p. 236 sqf, A. H. J. Greenidge, p. 102 sqf; Saato's article "Ephoroi" in Pauly-Wissowa, Realencyclopaedie, v. 2860 sqf; Ed. Meyer, Forschung, i. 252 sqf, in Allen Geschichte, v. 40 sqf, O. Müller, Die Sparta, bk. iii. ch. viii.; G. Grote, History of Greece, pt. ii. ch. vi.; G. Budowit, Griechische Geschichte, i. 555 sqf; B. Niese, Historische Zeitschrift, viii. 28 sqf. Of the many monographs dealing with this subject the following are specially useful: G. Dum, Entstehung und
supplied by his own works, as well as by the manner in which it is overloaded with miraculous events. The following is a probable outline of the main facts of Ephraim's life. He was born in the reign of Constantine (perhaps in 306) at or near Nisibis. His father was a pagan, the priest of an idol called Abnil or Abzial. During his boyhood Ephraim showed a repugnance towards heathen worship, and was eventually driven by his father from the home. He became a ward and disciple of the famous Jacob—the same who attended the Council of Nicaea as bishop of Nisibis, and died in 336. At his hands Ephraim seems to have received baptism at the age of 18 or 28 (the two recensions differ on this point), and remained at Nisibis till its surrender to the Persians by Jovian in 353. Probably in the course of these years he was ordained a deacon, but from his humble estimate of his own worth refused advancement to any higher degree in the church. He seems to have played an important part in guiding the fortunes of the city during the war begun by Shapur II. In 337, in the course of which Nisibis was thrice unsuccessfully besieged by the Persians (in 338, 346 and 350). The statements of his biographer to this effect accord with the impression we derive from his own poems (Carmina Ninibena, 1-21). His intimate relations with Bishop Jacob were continued with the three succeeding bishops—Babu (353-3749), Volgoasses (3749-361), and Abraham—on all of whom he wrote encomia. The surrender of the city in 363 to the Persians resulted in a general exodus, except the Christians, and Ephraim left with the rest. After visiting Amid (Diirbek) he proceeded to Edessa, and there settled and spent the last ten years of his life. He seems to have lived mainly as a hermit outside the city: his time was devoted to study, writing, teaching and the reftuation of heresies. It is possible that during these years he paid a visit to Basel at Caesarea. Near the end of his life he rendered great public service by distributing provisions in the city during a famine. The best estimates date for his death is the 9th of June 373. It is clear that this chronology leaves no room for the visit to Egypt, and the eight years spent there in refuting Arianism, which are alleged by his biographer. Perhaps, as has been surmised, there may be confusion with another Ephraim. Nor can he have written the funeral panegyric on Basil who survived him by three months. But with all necessary deductions the biography is valuable as witnessing to the immense reputation for sanctity and for theological acumen which Ephraim had gained in his lifetime, or at least soon after he died. His biographer's statement as to his habits and appearance is worth quoting, and is probably true: "From the time he became a monk to the end of his life his only food was barley bread and sometimes pulse and vegetables: his drink was water. And his flesh was dried upon his bones, like a potter's sherd. His clothes were of many pieces patched together, the colour of old straw. His stature was little; his countenance was always sad, and he never condescended to laughter. And he was bald and beardless."

The statement in his Life that Ephraim miraculously learned Coptic falls to the ground with the narrative of his Egyptian visit: and the story of his suddenly learning to speak Greek through the prayer of St Basil is equally unworthy of credence. He probably wrote only in Syriac, though he may have possessed some knowledge of Greek and possibly of Hebrew. But many of his works must have been early translated into other languages; and we possess in MSS. versions into Greek, Armenian, Coptic, Arabic and Ethiopic. The Greek versions occupy three entire volumes of the Roman folio edition, and the extant Armenian versions (mainly of N.T. commentaries) were published at Venice in four volumes in 1836. It was primarily as a sacred poet that Ephraim impressed himself on his following century. With the exception of his commentaries on scripture, nearly all his extant Syriac works are composed in metre. In many cases the metrical structure

1 It is now generally recognized, thanks to Volgwarden and others, that Ephraim is the principal authority followed by Diodorus, except in the chapters relating to Sicilian history.
is of the simplest, consisting only in the arrangement of the discourse in lines of uniform length—usually heptasyllabic (Ephraim’s favourite metre) or pentasyllabic. A more complicated arrangement is found in other poems, such as the *Carmina Nisibena*: these are made up of strophes, each consisting of lines of different lengths according to a settled scheme, with a recurring refrain. T. J. Lamy has estimated that, in this class of poems, there are as many as 66 different varieties of metres to be found in the works of Ephraim. These strophic poems were set to music, and sung by alternating choirs of girls. According to Ephraim’s biographer, his main motive for providing these hymns set to music was his desire to counteract the baneful effects produced by the heretical hymns of Bardaisan and his son Harmonius, which had enjoyed popularity and been sung among the Edessenes for a century and a half.

The subject-matter of Ephraim’s poems covers all departments of theology. Thus the Roman edition contains (of metrical works) exegetical discourses, hymns on the Nativity of Christ, 65 hymns against heretics, 85 on the Faith against sectaries, a discourse against the Jews, 85 funeral hymns, 4 on free-will, 76 exhortations to repentance, 12 hymns on paradise, and 12 on miscellaneous subjects. The edition of Lamy has added many other poems, largely connected with church festivals. It must be confessed that, judged by Western standards, the poems of Ephraim are prolix and wearisome in the extreme, and are distinguished by few striking poetic beauties. And so far as they are made the vehicle of reasoning, their efficiency is seriously hampered by their poetic form. On the other hand, it is fair to remember that the taste of Ephraim’s countrymen in poetry was very different from ours. As Duval remarks: “quant à la profondeur de saint Ephrem que nous trouvons parfois fastidieuse, on ne peut la condamner sans tenir compte du gout des Syriens qui aimait les répétitions et les développements de la même pensée, et voyaient des qualités là où nous trouvons des défauts (Lett. syrienne, p. 45). He is no worse in these respects than the best of the Syriac writers who succeeded him. And he surpasses almost all of them in the richness of his diction, and his skill in the use of metaphors and illustrations.

Of Ephraim as a commentator on Scripture we have only imperfect means of judging. His commentaries on the O.T. are at present accessible to us only in the form they had assumed in the *Catena Patrum* of Severus (compiled in 861), and to some extent in quotations by later Syriac commentators. His commentary on the Gospels is of great importance in connexion with the textual history of the N.T., for the text on which he composed it was that of the Diatessaron. The Syriac original is lost; but the ancient Armenian version survives, and was published at Venice in 1856 along with Ephraim’s commentary on the Pauline epistles (also only extant in Armenian) and some other works. A Latin version of the Armenian Diatessaron commentary has been made by Aucher and Mosinger (Venice, 1876). Using this version as a clue, J. R. Harris has been able to identify a number of Syriac quotations from or references to this commentary in the works of Iba’dadh, Bar-Khepa (Severus), Bar-galibi and Barhebraeus. Although, as Harris points out, it is unlikely that the original text of the Diatessaron has come down unchanged through the two centuries to Ephraim’s day, the text on which he comments was in the main unaffected by the revision which produced the Peshitta. Side by side with this conclusion may be placed the result of F. C. Burkitt’s careful examination of the quotations from the Gospels in the other works of Ephraim; he shows conclusively that in all the undoubtedly genuine works the quotations are from a pre-Peshitta text.

As a theologian, Ephraim shows himself a stout defender of Nicaean orthodoxy, with no leanings in the direction of either the Nestorian or the Monophysite heresies which arose after his time. He regarded it as his special task to combat the views of Marcion, of Bardaisan and of Mani.

To the modern historian Ephraim’s main contribution is in the material supplied by the 7a hymns known as *Carmina Nisibena* and published by G. Bickell in 1866. The first 20 poems were written at Nisibis between 350 and 363 during the Persian invasions; the remaining 52 at Edessa between 363 and 373. The former tell us much of the incidents of the frontier war, and particularly enable us to reconstruct in detail the history of the third siege of Nisibis in 350.

Of the many editions of Ephraim’s works a full list is given by Nestle in *Reinlk. f. Lit. und Kgl. wiss. u. Kunst* (3rd ed.). For modern students the most important are: (1) the great folio edition in 6 volumes (3 of works in Greek and 3 in Syriac), in which the text is stated to have been accompanied by a Latin version (Rome, 1735—1746); on the unsatisfactory character of this edition (which includes many works that are not Ephraim’s) and especially of the Latin version, see Burkitt, *Ephraim’s Quotations*, pp. 1 sqq. (2) *Carmina Nisibena*, compiled by Ephraim, with a Latin translation by T. J. Lamy (4 vols., Malines, 1882—1902). Many selected homilies have been edited or translated by Overbeck, Zingerle and others (cf. Wright, Short History, pp. 35 sqq.); a selection of the *Hymns* was translated by H. Burgess, *Select Metrical Hymns of Ephrem Syrus* (1853). Of the two recensions of Ephraim’s biography, one was edited in part by J. S. Assemani (B.O. i. 26 sqq.) and in full by S. E. Assemani in the Roman edition (iii. pp. xxii—lxxii.); the other by Lamy (ii. 590) and Bedjan (Lcma mart. et sanct. ill. 621—665). The long poem on the history of Joseph, twice edited by Bedjan (Paris, 1887; and 1892) and by him attributed to Ephraim, is more probably the work of Barlaam (N. M.).

**Ephraim**, a tribe of Israel, called after the younger son of Joseph, who in his benediction exalted Ephraim over the elder brother Manasseh (Gen. xxxvii.). These two divisions were often known as the “house of Joseph.” (Josh. xxvii. 14 sqq.; Judg. i. 29; 2 Sam. xix. 20; 1 Kings xi. 28). The relations between them are obscure; conflicts are referred to in Is. ix. 21, and Ephraim’s proud and ambitious character is indicated in its demands as narrated in Josh. xvii. 14; Judg. vii. 1—3, xii. 1—6. Thoughout, Ephraim played a distinctive and prominent part; it probably excelled Manasseh in numerical strength, and the name became a synonym for the northern kingdom of Israel. Originally the name may have been a geographical term for the central portion of Palestine. Regarded as a tribe, it lay to the north of Benjamin, which traditionally belongs to it; but whether the young “brother” (see *Benjamin*) sprang from it, or grew up separately, is uncertain. Northwards, Ephraim lost itself in Manasseh, even if it did not actually include it (Judg. i. 27; 1 Chron. vii. 29); the boundaries between them can hardly be recovered. Ephraim’s strength lay in the possession of famous sites: Tirzah, with the throne of the tribal assembly; Bethel and Shiloh, capitals; Shiloh, at one period the home of the ark; Timnah—Serah (or Hesra), the burial-place of Joshua; and Samaria, whose name was afterwards extended to the whole district (see *Samaria*).

Shechem itself was visited by Abraham and Jacob, and the latter bought from the sons of Hamor a burial-place (Gen. xxxiii. 19). The story of Dinah may imply some early settlement of tribes in its vicinity (but see *Simeon*), and the reference in Gen. xlvi. 22 (see R. V. *mary*) alludes to its having been forcibly captured. But how this part of Palestine came into the hands of the Israelites is not definitely related in the story of the invasion (see *Joshua*).

A careful discussion of the Biblical data referring to Ephraim is given by H. W. Hogg, *Enzy. Bib.*, s.v. On the characteristic narratives which appear to have originated in Ephraim (viz. the Ephraimites or Elohist source, E), see *Genesis* and *Bible: Old Testament Criticism*. See further *Arimelich*; *Gidron*; *Manasseh*; and *Jews: History*.

**Ephthalites, or White Huns.** This many-named and enigmatical tribe was of considerable importance in the history of India and Persia in the 5th and 6th centuries, and was known to the Byzantine writers, who call them Ἐφθαλίων, Ἐφθαλοῦς, Νεφθαλίων or Ἀβάδλων. The last of these is an independent attempt to render the original name, which was probably 1Fragments of the Commentary of Ephrem Syrus upon the Diatessaron (Lat. vers.) in *Test. et Stud.* vol. vii. (Cambridge, 1901).
something like Apati or Haptal, but the initial N of the third is believed to be a clerical error. They were also called Δωρος Owṛoς or Xwro, White (that is fair-skinned) Huns. In Arabic and Persian they are known as Hailat and in Armenian as Haithal, Idal or Hepthal. The Chinese name Yetha seems an attempt to represent the same sound. In India they were called Hūnas. Ephthalite is the usual orthography, but Hepthalite is perhaps more correct.

Our earliest information about the Ephthalites comes from the Chinese chronicles, in which it is stated that they were originally a tribe of the great Yue-Chi (p.e.), living to the north of the Great Wall, and in subjection to the Jven-Jwen, as were also the Turks at one time. Their original name was Hoa or Hoa-tun; subsequently they styled themselves Ye-tha-i-li-to after the name of their royal family, or more briefly Ye-tha.

Before the 5th century A.D. they began to move westwards, for about 420 they find them in Transoxiana, and for the next 130 years they were a menace to Persia, which they continually and successfully invaded, though they never held it as a conquest. The Sassanid king, Bahram V., fought several campaigns with them and succeeded in keeping them at bay, but they defeated and killed Përoz (Firuz), A.D. 484. His son Kavad I (Kobad), being driven out of Persia, took refuge with the Ephthalites, and recovered his throne with the assistance of their khan, whose daughter he had married, but subsequently he engaged in prolonged hostilities with them. The Persians were not quite out of it until 537 when Chosroes Anushirwan destroyed their power with the assistance of the Turks, who now make their first appearance in western Asia.

The Huns who invaded India appear to have belonged to the same stock as those who molested Persia. The headquarters of the horde were at Bamian and at Balkh, and from these points they raided south-east and south-west. Skandagupta repelled an invasion in 455, but the defeat of the Persians in 482 probably strengthened their activity, and at the end of the 5th century their chief Toromana penetrated to Malwa in central India and succeeded in holding it for some time. His son Mihiragula (c. 510–540) made Sakala in the Punjab his Indian capital, but the cruelty of his rule provoked the Indian princes to form a confederation and revolt against him about 538. He was not, however, killed, but took refuge in Kashmir, where after a few years he seized the throne and then attacked the neighbouring kingdom of Gandhara, perpetrating terrible massacres. About a year after this he died (c. 540), and shortly afterwards the Ephthalites collapsed under the attacks of the Turks. They do not appear to have moved on to another sphere, as these nomadic tribes often did when defeated, and were probably gradually absorbed in the surrounding populations. Their political power perhaps continued in the Gujjar empire, which at one time extended to Bengal in the east and the Nerbudda in the south, and continued in a diminished form until A.D. 1040. These Gujras appear to have entered India in connection with the Hunsian invasions.

Our knowledge of the Indian Hūnas is chiefly derived from coins, from a few inscriptions distributed from the Punjab to central India, and from the account of the Chinese pilgrim Hsuan Tsang, who visited the country just a century after the death of Mihiragula. The Greek monk Cosmas Indicopleustes, who visited India about 530, describes the ruler of the country, whom he calls Gollas, as a White Hing king, who exacted an oppressive tribute with the help of a large army of cavalry and war elephants. Gollas no doubt represents the last part of the name Mihiragula or Mihirakula.

The accounts of the Ephthalites, especially those of the Indian Hūnas, dwell on their ferocity and cruelty. They are represented as delighting in massacres and torture, and it is said that popular tradition in India still retains the story that Mihiragula used to amuse himself with elephants, and when they refused to come up or listen to him he would take his agones. Their invasions shocked Indian society and institutions to the foundations, but, unlike the earlier Kushans, they do not seem to have introduced new ideas into India or have acted as other than a destructive force, although they may perhaps have kept up some communication between India and Persia.

The first part of Mihiragula seems to be the name of the Persian deity Mithra, but his patron deity was Siva, and he left behind him the reputation of a ferocious persecutor of Buddhism. Many of his coins bear the Nandi bull (Siva’s emblem), and the king’s name is preceded by the title sāhī (shah), which had previously been used by the Kushan dynasty. Toramana’s coins are found plentifully in Kashmir, which, therefore, probably formed part of the Hūna dominions before Mihiragula’s time. D. C. S. R. MacRae has pointed out that when he died there was no evidence that he was taking refuge, if not with his own subjects, at least with a kindred clan.

Greek writers give a more flattering account of the Ephthalites, which may perhaps be due to the fact that they were useful to the East Roman empire as enemies of Persia and also not dangerously near. Procopius says that they were far more civilized than the Huns of Attila, and the Turkish ambassador who was received by Justin is said to have described them as ἀρουσόν, which might merely mean that they lived in the cities which they conquered. The Chinese writers say that their customs were like those of the Turks; that they had no cities, lived in felt tents, were ignorant of writing and practised polyandry. Nothing whatever is known of their language, but some scholars explain the names Toramana and Jauvla as Turkish.

For the possible connexion between the Ephthalites and the European Huns see Huns. The Chinese statement that the Hous or Ye-tha were a section of the great Yue-Chi, and that their customs resembled those of the Turks (Tu-Klue), is probably correct, but does not amount to much, for the relationship did not prevent them from fighting with the Yue-Chi and Turks, and means little more than that they belonged to the warlike and energetic section of central Asian nomads, which is in any case certain. They appear to have been more ferocious and less assimilative than the other conquering tribes. This may, however, be due to the fact that their contact with civilization was so short; the Yue-Chi and Turks had had some commerce with more advanced races before they played any part in political history, but the Ephthalites appear as raw barbarians, and were annihilated as a nation in little more than a hundred years. Like the Yue-Chi they have probably contributed to form some of the physical types of the Indian population, and it is noticeable that polyandry is a recognized institution among many Himalayan tribes and is also said to be practised secretly by the Jats and other races of the plains.

Among original authorities may be consulted Procopii, Menander Protector, Cosmas Indicopleustes (trans. McEvedy, Hakluyt Soc. 1867), the Kāsamāta (1900), and Y. Wang (1909); see also A. Stein, White Huns and Kindred Tribes (1905); D. C. S. R. MacRae, Beiträge aus chinesischen Quellen zur Kenntnis der Turfaner und Sakas (1904); Ulfahl, Memoire sur les Huns Blanches (1898); Drouin, Memoire sur les Huns Ephthalites (1895); and various articles by Vincent Smith, Specht, Drouin, and E. H. Parker in the Journal of the Royal Asiatic Society, Journal asiatique, Revue numismatique, Asiatic Quarterly, &c.

ÉPI, the French architectural term for a light finial, generally of metal, but sometimes of terra-cotta, forming the termination of a spire or the angle of a roof.

EPICENE (from the Gr. ἐπικέντρον, common), a term in Greek and Latin grammar denoting nouns which, possessing but one gender, are used to describe animals of either sex. In English grammar there are no true epicene nouns, but the term is sometimes used instead of common gender. In figurative and literary language, epicene is an adjective applied to persons having the characteristics of both sexes, and hence is occasionally used as a synonym of "effeminate."

EPICARMUS (c. 540–545 b.c.), Greek comic poet, was born in the island of Cos. Early in life he went to Megara in Sicily, and after its destruction by Gelo (484) removed to Syracuse, where he spent the rest of his life at the court of Hiero, and died at the age of ninety-seven. He composed a large number of plays, and died in the 25th year of his reign. His fame was such that he was regarded as a hero of the Sicilian Drama. He was the author of more than 150 plays, and the subjects of many of them were taken from the lives of the ancient heroes.

Of his works 35 titles and a
few fragments have survived. In the city of tyrants it would have been dangerous to present comedies like those of the Athenian stage, in which attacks were made upon the authorities. Accordingly, the comedies of Epicarmus are of two kinds, neither of them calculated to give offence to the ruler. They are either mythological travesties (resembling the satyrical drama of Athens) or character comedies. To the first class belong the Budrissi, in which Heracles is represented as a voracious glutton; the Marriage of Hēbe, remarkable for a lengthy list of clients; The second class is exemplified in the Odyssey. The second class contains a vivid picture of the population (the sailor, the prophet, the boor, the parasite). Some of the plays seem to have bordered on the political, as The Plundering, describing the devastation of Sicily in the time of the poet. A short fragment has been discovered (in the Rainer papyri) from the Όθωνας αγρομος, which told how Odysses got inside Troy in the disguise of a beggar and obtained valuable information. Another feature of his works was the large number of excellent sentiments expressed in a brief proverbial form; the Pythagoreans claimed him as a member of their school, who had forsaken the study of philosophy for the writing of comedy. Plato (Theaetetus, 152 e) puts him at the head of the masters of comedy, coupling his name with Homer and, according to a remark in Diogenes Laërtius, Plato was indebted to Epicarmus for much of his philosophy. Ennius called his didactic poem on natural philosophy Epicarmus after the comic poet. The metres employed by Epicarmus were iambic trimeters, and especially trochaic tetrameters and anapestic tetrameters. The plot of the plays was simple, the action lively and rapid; hence they were classed among the fabulae motoriae (stirring, bustling), as indicated in the well-known line of Horace (Epistles, ii. 1. 53):

"Plautus ad exemplar Siculi properare Epicarmi."

Epicarmus is the subject of articles in Suidas and Diogenes Laërtius (viii. 3). See A. G. Lorenz, Leben und Schriften des Koez E. (with account of the Doric drama and fragments, 1864); J. Girard, Études sur la poésie grecque (1884); Kaibel in Pauly-Wissowa's Realencyclopädie, according to whom Epicarmus was a Siceliot; for the papyrus fragment, Blass in Jahrbiicher f. Philologie, cxviii. 1889.

**EPIC POETRY**

**Greek poetry: Epos (from the Gr. ἔpos, a story, and ἔρως, pertaining to a story), the names given to the most dignified and elaborate forms of narrative poetry. The word ἔρως is also, but more rarely, employed to designate the same thing, especially in Greek being a maker of epic poetry, and because what he makes.**

It is to Greece, where the earliest literary monuments which we possess are of an epic character, that we turn for a definition of these vast heroic compositions, and we gather that their subject-matter was not confined, as Víoltaire and the critics of the 18th century supposed, to "narratives in verse of warlike adventures." When we first discover the epos, hexameter verse has already been selected for its vehicle. In this form epic poems were composed not merely dealing with war and personal romance, but carrying out a didactic purpose, or celebrating the mysteries of religion. These three divisions, to which are severally attached the more or less mythical names of Homer, Hesiod and Orpheus, seem to have marked the earliest literary movement of the Greeks. But, even here, we must be warned that what we possess is not primitive; there had been unwritten epics, probably in hexameters, long before the composition of any now-surviving fragment. The saga of the Greek nation, the catalogue of its arts and possessions, the rites and beliefs of its priesthood, must have been circulated, by word of mouth, long before any historical poet was born. We look upon Homer and Hesiod as records of primitive thought, but Professor Gilbert Murray reminds us that "our Iliad, Odyssey, Erga and Theogony are not the first, nor the second, nor the twelfth of such embodiments."

The early epic poets, Lesches, Linus, Orpheus, Homer and Hesiod, are in a certain sense not the names we are used to hearing, but names often betray their symbolic and fabulous character. It is now believed that there was a class of minstrels, the Rhapsodists or Homeridae, whose business it was to recite poetry at feasts and other solemn occasions. "The real bards of early Greece were all nameless and impersonal." When our tradition begins to be preserved, we find everything of a saga-character attributed to Homer, a blind man and an inhabitant of Chios. This gradually crystallized until we find Aristotle definitely treating Homer as a person, and attributing to him the composition of three great poems, the Iliad, the Odyssey and the Iliad, now lost (see Homer). The first two of these have been preserved and form for us the type of the ancient epic; when we speak of epic poetry, we unconsciously measure it by the example of the Iliad and the Odyssey. It is not certain, however, that these poems had not merely been preceded by a vast number of revisions of the mythical history of the country, but were accompanied by innumerable poems of a similar character, now entirely lost. That antiquity did not regard these other epics as equal in beauty to the Iliad seems to be certain; but such poems as Cypria, Ilios Peraios (Sack of Ilios) and Aethiopis can hardly but have exhibited other sides of the epic tradition. Did we possess them, it is almost certain that we could speak with more assurance as to the scope of epic poetry in the days of oral tradition, and could understand more clearly what sort of ballads in hexameter it was which rhapsodes took round from court to court. In the 4th century B.C. it seems that people began to write down what was not yet forgotten of all this oral poetry. Unfortunately, the earliest critic who describes this process is Proclus, a Byzantine neo-Platonist, who did not write until some 800 years later, when the whole tradition had become hopelessly corrupted. Proclus, in his most important work on epic poetry, the De Poet. hexametricis, tells us that those who, on the ground that such existence critics will be eternally divided, we reach in the 7th century A.D, Poetas of Rhodes, who wrote an epic poem, the Heraclea, of which fragments remain. Other epic writers, who appear to be undoubtedly historic, are Antimachus of Colophon, who wrote a Thesias; Panayis, who, like Peisander, celebrated the feats of Heracles; Choeirius of Samos; and Anyte, of whom we only know that she was an epic poetess, and who is called "the daughter of Homer." In the 6th and 5th centuries B.C. there was a distinct school of philosophic epic, and we distinguish the names of Xenophanes, Parmenides and Empedocles as the leaders of it.

From the dawn of Latin literature epic poetry seems to have been cultivated in Italy. A Greek exile, named Livius Andronicus, translated the Odyssey into Latin during the first Punic War, but the earliest original epic of Rome was the lost Belium Punicum of Naevius, a work to which Virgil was indebted. A little later, Ennius composed, about 172 B.C., in 16 books, an epicatical historical of the Aeneid, dealing with the whole chronicle of Rome. This was the foremost Latin poem, until the appearance of the Aeneid; it was not imitated, remaining, for a hundred years, as Mr Mackail has said, "not only the unique, but the satisfying achievement in this kind of poetry." Virgil began the most famous of Roman epics in the year 30 B.C., and when he died, nine years later, he desired that the MS. of the Aeneid should be burned, as it required three years' work to complete it. Nevertheless, it seems to us, and seemed to the ancient world, almost perfect, and a priceless monument of art; it is written, like the great Greek poems on which it is patently modelled, in hexameters. In the next generation, the Pharsalia of Lucan, of which Cato, as the type of the republican spirit, is the hero, was the principal example of Latin epic. Statius, under the Flavian emperors, wrote several epic poems, of which the Thebaid survives. In the 1st century A.D. Valerius Flaccus wrote the Argonautica in 8 books, and Silius Italicus the Punic War, in 17 books; these authors show a great decline in taste and merit, even in comparison with Statius, and Silius Italicus, in particular, is as purely imitative as the worst of the epic writers of modern Europe. At the close of the 4th century the style revived with Claudian, who produced five or six elaborate historical and mythological epics of which the Rapo of Proserpine was probably the most remarkable. In his interesting poetry we have a valuable link between the Silver Age in Rome and the Italian Renaissance. With Claudian the history of epic poetry among the ancients closes. In medieval times there existed a large body of narrative
poetry to which the general title of Epic has usually been given. Three principal Beowulf is recognized, the French, the Teutonic and the Icelandic. Teutonic epic poetry deals, as a rule, with legends founded on the history of Germany in the 4th, 5th and 6th centuries, and in particular with such heroes as Ermanaric, Attila and Theodoric. But there is also an important group in it which deals with English themes, and among these Beowulf, Wulfere, The Lay of Maldon and Ffimbres are pre-eminent. To this group belongs the poem of Hildibrand, although c. 800, among these Beowulf is the only one which exists in anything like complete form, and it is of all examples of Teutonic epic the most important. With all its trivialities and incongruities, which belong to a barbarous age, Beowulf is yet a solid and comprehensive example of native epic poetry. It is written, like all old Teutonic work of the kind, in alliterative unrhymed rhythm. In Iceland, a new heroic literature was invented in the middle ages, and to this we owe the Sagas, which are, in fact, a reduction to prose of the legends of the warlike history of the North. These Sagas took the place of a group of archaic Icelandic epics, the series of which seems to have closed with the noble poem of Atlamal, the principal surviving specimen of epic poetry as it was cultivated in the primitive literature of Iceland. The surviving epical fragments of Icelandic composition are found thrown together in the Codex Regius, under the title of The Elder Edda, a most precious museum piece, and in the 15th century in the Icelandic verse to have been shorter and more episodical in character than the lost Teutonic specimens; both kinds were written in alliterative verse. It is not probable that either possessed the organic unity and vitality of spirit which make the Sagas so delightful. The French medieval epics (see CHANSONS DE GESTE) are late in comparison with those of England, Germany and Iceland. They form a curious transitional link between primitive and modern poetry; the literature of civilized Europe may be said to begin with them. There is a great increase of simplicity, greater breadth of scene. The Teutonic epics were obscure and intense, the French chansons de geste are lucid and easy. The existing masterpiece of this kind, the magnificent Roland, is doubtless the most interesting and pleasing of all the epics of medieval Europe. Professor Ker’s analysis of its merits may be taken as typical of all that is best in the vast body of epic which comes between the antique models, which were unknown to the medieval poets, and the artificial epics of a later time which were founded on vast ideal themes, in imitation of the ancients. “There is something lyrical in Roland, but the poem is not governed by lyrical principles; it requires the deliberation and the freedom of epic; it must have room to move in before it can come up to the height of its argument. The abruptness of its periods is not really an interruption of its even flight; it is an abruptness of detail, like a broken sea with a larger wave moving under it; it does not impair the grandeur of the movement as a whole.” Of the progress and decline of the chansons de geste (q.v.) from the ideals of Roland, a fuller account is given elsewhere. To the Nibelungenlied (q.v.) also, detailed attention is given in a separate article.

What may be called the artificial or secondary epics of modern Europe, founded upon an imitation of the Iliad and the Aeneid, are more numerous than the ordinary reader supposes, although but few of them have preserved much vitality. In Italy the Chanson de Roland inspired romantic epics by Luigi Pulci (1432–1487), whose Morgante Maggiore appeared in 1481, and is a masterpiece of burlesque; by M. M. Boiardo (1434–1494), whose Orlando Innamorato was finished in 1486; by Francesco Bello (1440–1493), whose Marsiappo was published in 1497; by Lodovico Ariosto (q.v.), whose Orlando Furioso, by far the greatest of its class, was published in 1516, and by Luigi Dolci (1506–1568), as well as by a great number of less illustrious poets. G. G. Triassina (1475–1540) wrote a Eneid of 1550, and Bernardo Tasso (1492–1558) an Amadigi in 1559; Berni remodelled the epic of Boiardo in 1541, and Teofilo Folengo (1401–1544), ridiculed the whole school in an Orlandino of 1526. A extraordinary feat of mock-heroic epic was The Basin (1622) of Alessandro Tassoni (1565–1618). The most splendid of all the epics of Italy, however, was, and remains, the Jerusalem Delivered by Torquato Tasso (q.v.), published originally in 1580, and afterwards rewritten as The Conquest of Jerusalem, 1593. The fantastic Adone (1623) of G. B. Marini (1569–1625) and the long poems of Chibera, close the list of Italian epics. Early Portuguese literature is rich in epic poetry. Luis Pereira Brandão wrote an Elegíada in 15 books, published in 1588; Jeronimo Corte-Real (d. 1588) a Shipwreck of Sepulveda, and in two other epics, V. M. Andrade published a Search for Africa, in 12 books; Sá de Meneses (d. 1664) a Conquest of Malacca, 1634; but all these, and many more, are obscured by the glory of Canoens (q.v.), whose magnificent Lusiados had been printed in 1572, and forms the summit of Portuguese literature. In Spanish poetry, the Poem of the Cid takes the first place, as the great national epic of the middle ages; it is supposed to have been written between 1155 and 1175. It was followed by the Rodrigo, and the medieval school closes with the Alfonso XI. of Rodrigo Yáñez, probably written at the close of the 12th century. The success of the Italian imitative epics of the 15th century led to some imitation of their form in Spain. Juan de la Cueva (1552–1606) published a Conquest of Bética in 1603; Cristóbal de Virues (1550–1610) a Monserrate, in 1588; Luis Barahona de Soto continued Ariosto in a Tears of Angélica; Gutiérrez wrote an Asiria in 1584; but perhaps the finest modern epic in Spanish verse is the Araucana (1569–1600) of Alonso de Ercilla y Zúñiga (1527–1590), “the first literary work of merit,” as Mr Fitzmaurice-Kelly remarks, “composed in either American continent.” In France, the epic never flourished in modern times, and no real success attended the Franciadé de Ronsard, the Alarc de Scudéry, the Pucelle of Chapelain, the Divine Épopée of Soumet, or even the Henriade de Voltaire. In English literature the Faery Queen of Spenser has the same claim as the Italian poems mentioned above to bear the name of epic, and Milton, who stands entirely apart, may be said, by his isolated Paradise Lost, to take rank with Homer and Virgil, as one of the three types of the mastery of epic composition. See Boassé, Traité du poème épique (1675); Voltaire, Sur la poésie épique: Fauvel, L’Origine de l’épopée chevaleresque (1823); W. P. Fraser, Modern epic Poetry (1889); and Essays in Modern Literature (1895); Ernest Dowson, History of Ancient Greek Literature (1897); W. von Christ, Geschichte der griechischen Litteratur (1879); Gaston Paris, La Littérature française au moyen âge (1890); Léon Gautier, Les Épopées françaises (1865–1886). For works on the Greek epics see also GREEK LITERATURE and CYCLE. (E. G.)

EPICTETUS (born c. A.D. 60), Greek philosopher, was probably a native of Hierapolis in south-west Phrygia. The name Epictetus is merely the Greek for “acquired” (from ἐπεκτείνασθαι); his original name is not known. As a boy he was a slave in the house of Epaphroditus, a freedman and courtier of the emperor Nero. His master died, however, and by personal address of the Stoic Musonius Rufus, and subsequently became a freedman. He was lame and of weakly health. In 90 he was expelled with the other philosophers by Domitian, who was irritated by the support and encouragement which the opposition to his tyranny found amongst the adherents of Stoicism. For the rest of his life he settled at Nicopolis, in southern Epirus, not far from the scene of the battle of Actium. There for several years he lived, and taught by great earnestness, and in particular by the Stoic Musonius Rufus, and subsequently became a freedman. He was lame and of weakly health. In 90 he was expelled with the other philosophers by Domitian, who was irritated by the support and encouragement which the opposition to his tyranny found amongst the adherents of Stoicism. The philosophy of Epictetus is intensely practical, and exhibits a high idealistic type of morality. He is an earnest, sometimes stern and sometimes pathetic, preacher of righteousness, who despises the mere graces of style and the subtleties of an abstruse logic. His chief source of authority is the practice of the Stoics and the advice given in the course of daily life, nor entangled by relationships, which if he transgresses he will be the character of a man of honour, while if he upholds them he will cease to be the messenger, watchman and herald of the gods. The perfect man thus described will not be angry with the wrong-doer; he will only pity his erring brother; for anger in such a case would only betray that he too thought the wrong-doer gained a substantial blessing by his wrongful act, instead of being, as he is, utterly ruined.

The best editions of the works of Epictetus are by J. Schweiggert (6 vols., Leipzig, 1799-1800) and S. Schenkl (Leipzig, 1842, 1848). English translations by Elizabeth Carter (London, 1758); G. Long (London, 1848, ed. 1877, 1892, 1897); T. W. Heigl (Boston, 1865, new ed. 1890) of the Encheiridion alone by H. Talbot (London, 1881); T. W. H. Rolleston (London, 1881). See A. Bonhoeffer, Epiktet ein Stoiker (Stuttgart, 1890) and Die Ethik des Stoikers Epiktet (1894); E. M. Schrank, Der Stoiker Epiktet und seine Philosophie (Frankfort, 1885); T. Zahn, Der Stoiker Epiktet und sein Verhältnis zum Christentum (2nd ed. Erlangen, 1885).

EPICURUS (342-270 B.C.), Greek philosopher, was born in Samos in the end of 342 or the beginning of 341 B.C., seven years after the death of Plato. His father Neocles, a native of Gargettos, a small village of Attica, had settled in Samos, not later than 332, as one of the cleruchs sent out after the victory of Timotheus in 366-365. At the age of eighteen he went to Athens, where the Platonic school was flourishing under the lead of Xenocrates. At Athens, however, Antipater, a rich freedman of the poorer citizens, and Epicurus joined his father, who was now living at Colophon. It seems possible that he had listened to the lectures of Nausiphanes, a Democritan philosopher, and Pamphilius the Platonist, but he was probably, like his father, merely an ordinary teacher. Stimulated, however, by the perusal of some writings of Democritus, he began to formulate a doctrine of his own; and at Mitylene, Colophon and Lampascus, he gradually gathered round him several enthusiastic disciples. In 307 he returned to Athens, which had just been restored to a nominal independence by Demetrius Poliorcetes, and there he lived for the rest of his life. The scene of his teaching was a garden which he bought for about 1,300 (8 minae). There he passed his days as the loved and venerated head of a remarkable, and up to that time unique, society of men and women. Amongst the number were Metrodorus (d. 277), his brother Timocrates, and his wife Leontion (formerly a hetaera), Polyaenus, Hermachus, who succeeded Epicurus as chief of the school, Thessis, and Iomeneus, whose wife was a sister of Metrodorus. It is possible that the relations between the sexes—in this prototype of Rabelais's Abbey of Thélème—were not entirely what is termed Platonic. But there is on the other hand scarcely a doubt that the tales of licentiousness circulated by opponents are groundless. The stories of the Stoics, who sought to refute the views of Epicurus by an appeal to his alleged antecedents and habits, were no doubt in the main, as Diogenes Laertius says, the stories of maniacs. The general charges, which they endeavoured to substantiate by forged letters, need not count for much, and in many cases they only exaggerated what, if true, was not so heinous as they suggested. Against them trustworthy authorities testified to his general and remarkable considerateness, pointing to the statues which the city had raised in his honour, and to the numbers of his friends, who were many enough to fill whole cities.

The mode of life in his community was plain. The general dress was simple, water and oat bread, half a pint of wine was held an ample allowance. "Send me," says Epicurus to a correspondent, "send me some Cyprian cheese, so that, should I choose, I may fare sumptuously." There was no community of property, which, as Epicurus said, would imply distrust of their own and others' good resolutions. The company was held in unity by the charms of his personality, and by the free intercourse which he inculcated and exemplified. Though he seems...
to have had a warm affection for his countrymen, it was as human beings brought into contact with him, and not as members of a political body, that he preferred to regard them. He never entered public life. His kindliness extended even to his slaves, one of whom, named Mouse, was a brother in philosophy.

Epicurus died of stone in 270 B.C. He left his property, consisting of the garden (Κήπος Ἐρυθρών), a house in Melite (the south-west quarter of Athens), and apparently some funds besides, to two trustees on behalf of his society, and for the special interest of some youthful members. The garden was set apart for the use of the school; the house became the house of Hermarchus and his fellow philosophers during his lifetime. The surplus proceeds of the property were further to be applied to maintain a yearly offering in commemoration of his departed father, mother and brothers, to pay the expenses incurred in celebrating his own birthday every year on the 7th of the month Melanion, and for a social gathering of the sect on the 20th of every month in honour of himself and Metrodorus. Besides similar tributes in honour of his brothers and Polyaeus, he directed the trustees to be guardians of the son of Polyaeus and the son of Metrodorus; whilst the daughter of the last mentioned was to be married by the guardians to some member of the society who should be approved of by Hermarchus. His four slaves, three men and one woman, were left their freedom. His books passed to Hermarchus.

Philosophy.—The Epicurean philosophy is traditionally divided into the three branches of logic, physics and ethics. It is, however, only as a basis of facts and principles for his theory of life that logical and physical inquiries find a place at all. Epicurus himself had not apparently shared in any large or liberal culture, and his influence was certainly thrown on the side of those who deprecated purely scientific pursuits as one-sided and misleading. "Steer clear of all culture!" was his advice to a young disciple. In this aversion to a purely or mainly intellectual training may be traced a recoil from the systematic metaphysics of Plato and Aristotle, whose tendency was to subordinate the practical man to the philosopher. Ethics had been based upon logic and metaphysics. But experience showed that systematic knowledge of truth is not synonymous with right action. Hence, in the second place, Plato and Aristotle had assumed a perfect state with laws to guide the individual aright. It was thus comparatively easy to show how the individual could learn to apprehend and embody the moral law in his own conduct. But experience had in the time of Epicurus shown the temporary and artificial character of the civic form of social life. It was necessary, therefore, for Epicurus to go back to nature to find a more solid and wider basis for his ethical doctrine, to go back from words to realities, to give up reasonings and get at feelings, to test conceptions and arguments by a final reference to the only touchstone of truth—to sensation. There, and there only, one seems to find a common and a satisfactory ground, supposing always that all men's feelings give the same answer. Logic must go, but so also must the state, as a specially-privileged and eternal order of things, as anything more than a contrivance serving certain purposes of general utility. And the Epicureans elaborate logic of the Stoics was a superfluity. In place of logic we find canon, the theory of the three tests of truth and reality. (1) The only ultimate canon of reality is sensation; whatever we feel, whatever we perceive by any sense, that we know on the most certain evidence we can have to be real, and in proportion as our feeling is clear, distinct and vivid, in that proportion are we sure of the reality of its object. But in what that vividness (σάρκες) consists is a question for the Epicureans. What goes for a want of evidence, it is supposed, must have some doubt. (2) Besides our sensations, we learn truth and reality by our preconceptions or ideas (προδιάγνωσις). These are the fainter images produced by repeated sensations, the "ideas" resulting from previous "impressions"—sensations at second-hand as it were, which are stored up in memory, and which a general name serves to recall. These bear witness to reality, not because we feel anything new, but because we felt it once; they are sensations registered in language, and again, if need be, translatable into immediate sensations or groups of sensations. (3) Lastly, reality is vouched for by the imaginative apprehensions of the mind (παραημαντικοὶ ἱπθαλμαί), immediate feelings of which the mind is conscious as produced by some action of its own. This last canon, however, was of dubious validity. Epicureanism generally was content to affirm that whatever we effectively feel in consciousness is real; in which sense they allow reality to the fancies of the insane, the dreams of a sleeper, and those feelings by which we imagine the existence of beings of perfect blessedness and endless life. Similarly, just because they cherish and remember pleasant feelings during the intensity of consciousness, the Epicurean can hold that bodily pain and pleasure is a less durable and important thing than pain and pleasure of mind. Whatever we feel to affect us does affect us, and is therefore real. Error can arise only because we mix up our opinions and suppositions with what we actually feel. The Epicurean canon is a rejection of logic; it sticks fast to the one point that "sensation is sensation," and there is no more to be made of it. Sensation, it says, is unreasoning (ἀνιοῦσιν); it must be accepted, and not criticized. Reasoning can come in only to put sensations together, and to point out how they severally contribute to human welfare; it does not make them, and cannot alter them.

Physics.—In the Epicurean physics there are two parts—a general metaphysic and psychology, and a special explanation of particular phenomena of nature. The method of Epicurus is the argument of analogy. It is an attempt to make the phenomena of nature intelligible to us by regarding them as instances on a grand scale of that with which we are already familiar on a small scale. This is what Epicurus calls explaining what we do not see by what we do see.

In physics Epicurus founded upon Democritus, and his chief object was to abolish the dualism between mind and matter which is so essential a part in the systems of Plato and Aristotle. All that exists, says Epicurus, is corporeal (τὸ ἀνά̑ρακτον κοινονήμα); the intangible is non-existent, or empty space. If a thing exists it must be felt, and to be felt it must exert resistance. But not all things are intangible which our senses are not subtle enough to detect. We must indeed accept our feelings; but we must also believe much which is not directly testified by sensation, if only it serves to explain phenomena and does not contravene our sensations. The fundamental postulates of Epicureanism are atoms and the void (κόσμος καὶ κενόν). Space is infinite, and there is an illimitable multitude of indestructible, indivisible and absolutely compact atoms in perpetual motion in this illimitable space. These atoms, differing only in size, figure, feature and number, are perpetually entered into the void at a rate far surpassing our conceptions; as they move, they are for ever giving rise to new worlds; and these worlds are perpetually tending towards dissolution, and towards a fresh series of creations. This universe of ours is only one section out of the innumerable worlds in infinite space; other worlds may present systems very different from that of our own. The soul of man is only a finer species of body, spread throughout the whole aggregation which we term his bodily frame. Like a warm breath, it pervades the human structure and works with it; nor could it act as it does in perception unless it were corporeal. The various processes of sense, notably vision, are explained on the principles of materialism. From the surfaces of all objects there are continually flowing thin filmy images exactly copying the solid body whence they originate; and these images by direct impact on the organism produce (we need not care to ask how) the phenomena of vision. Epicurus in this way explains vision long before the physicists had got even to a bot to the point where light produced a direct contact of image and organ. But without following the explanation into the details in which it revels, it may be enough to say that the whole hypothesis is but an attempt to exclude the occult conception of action at a distance, and substitute a familiar phenomenon.

The Gods.—This aspect of the Epicurean physics becomes clearer when we look at his mode of rendering particular phenomena intelligible. His purpose is to eliminate the common idea of
divine interference. That there are gods Epicurus never dreams of denying. But these gods have not on their shoulders the burden of upholding and governing the world. They are themselves the products of the order of nature—a higher species than humanity, but not the rulers of man, neither the makers nor the upholders of the world. Man should worship them, but his worship is the reverence due to the ideals of perfect blessedness; it ought not to be inspired either by hope or by fear. To prevent all reference of the more potent phenomena of nature to divine action Epicurus rationalizes the processes of the cosmos. He imagines all possible plans or hypotheses, not actually contradicted by our experience of familiar events, which will represent in an intelligible way the processes of astronomy and meteorology. When two or more modes of accounting for a phenomena are equally admissible as not directly contradicted by known phenomena, it seems to Epicurus almost a return to the old mythological habit of mind when a savant asserts that the real cause is one and only one. "Thuder," he says, "may be explained in many other ways; only let us have no myths of divine action. To assign only a single cause for these phenomena, when the facts familiar to us suggest several, is insane, and is just the absurd conduct to be expected from people who dabble in the vain search of the invisible. We need not be too curious to inquire how these celestial phenomena actually do come about; we can learn how they might have been produced, and to go further is to trench on ground beyond the limits of human knowledge.

Thus, if Epicurus objects to the doctrine of mythology, he objects no less to the doctrine of an inevitable fate, a necessary order of things unchangeable and supreme over the human will. The Stoic doctrine of Fatalism seemed to Epicurus no less deadly a foe of man's true welfare than popular superstition. Even in the movement of the atoms he introduces a sudden change of direction, which is supposed to render their aggregation easier, and to break the even law of destiny. So, in the sphere of human action, Epicurus would allow of no absolutely controlling necessity. In fact, it is only when we assume for man this independence of the gods and of fateality that the Epicurean theory of life becomes possible. It assumes that man can, like the gods, withdraw himself out of reach of all external influences, and thus, as a sage, "live like a god among men, seeing that the man is in no wise like a mortal creature who lives in undying blessedness." And this present life is the only one. With one consent Epicureanism preaches that the death of the body is the end of everything for man, and hence the other world has lost all its terrors as well as all its hopes.

The attitude of Epicurus in this whole matter is antagonistic to science. The idea of a systematic enchainment of phenomena, in which the action of the soul, by being explained away, is taken in isolation and explained apart from the rest, was foreign to his mind. So little was the scientific conception of the solar system familiar to Epicurus that he could reproach the astronomers, because their account of an eclipse represented things otherwise than as they appear to the senses, and could declare that the sun and stars were just as large as they seemed to us.

Ethics.—The moral philosophy of Epicurus is a qualified hedonism, the heir of the Cyrenaic doctrine that pleasure is the good thing in life. Neither sect, it may be added, advocated sensuality pure and unfeigned—the Epicurean least of all. By pleasure Epicurus meant both more and less than the Cyrenics. To the Cyrenaics pleasure was of moments; to Epicurus it extended as a habit of mind through life. To the Cyrenaics pleasure was something active and positive; to Epicurus it was rather negative—tranquillity more than vigorous enjoyment. The test of true pleasure, according to Epicurus, is the removal and absorption of all that gives pain; it implies freedom from pain of body and from trouble of mind. The happiness of the Epicurean was, it might almost seem, a grave and solemn pleasure—a quiet unobtrusive ease of heart, but not exuberance and excitement. The sage of Epicureanism is a rational and reflective seeker for happiness, who balances the claims of each pleasure against the evils that may possibly ensue, and treads the path of enjoyment cautiously. Prudence is, therefore, the only real guide to happiness; it is thus the chief excellence, and the foundation of all the virtues. It is, in fact, says Epicurus—in language which contrasts strongly with that of Aristotle on the same topic—a more precious power than philosophy. The reason or intellect is introduced to balance possible pleasures and pains, and to construct a scheme in which pleasures are the materials of a happy life. Feeling, which Epicurus declared to be the means of determining what is good, is subordinated to a reason which adjudicates between competing pleasures with the view of securing tranquillity of mind and body. "We cannot live pleasantly without living wisely and nobly and righteously." Virtue is at least a means of happiness, though apart from that it is no good in itself, any more than mere sensual enjoyments, which are good only because they may sometimes serve to secure health of body and tranquillity of mind. (See further Eratns.)

The Epicurean School.—Even in the lifetime of Epicurus we hear of the vast numbers of his friends, not merely in Greece, but in Asia and Egypt. The crowds of Epicureans were a standing enigma to the adherents of less popular sects. Cicero pondered over the fact; Arcesilas explained the secession to the Epicurean camp, compared with the fact that no Epicurean was ever known to change to any other. We need not be too curious to inquire how a man might be turned into a eunuch, nor is it possible for a man to be turned into a eunuch, nor is it possible for a man to be turned into a eunuch, nor is it possible for a man to be turned into a eunuch, nor is it possible for a man to be turned into a eunuch. But the phenomenon was not obscure. The doctrine has many truths, and is attractive to many in virtue of its simplicity and its immediate relation to life. The dogmas of Epicurus became to his followers a creed embodying the truths on which salvation depended; and they passed on from one generation to another with scarcely a change or addition. The immediate disciples of Epicurus have been already mentioned, with the exception of Colotes of Lampsacus, a great favourite of Epicurus, who wrote a work arguing "that it was impossible even to live according to the doctrines of the other philosophers." In the 2nd and 1st centuries B.C. Apollodorus, nicknamed experiptov ("Lord of the Garden"), and Zeno of Sidon (who describes Socrates as "the Attic bufoon"); Cic. De nat. deor. i. 31, 33, 34) taught at Athens. About 150 B.C. Epicureanism established itself at Rome. Beginning with C. Amansius or Amaeusianus (Cic. Acad. 1. 2, Tusc. iv. 3), we find the names of Phaedrus (who became scholar at Athens c. 70 B.C.) and Philodemus (originally of Gadara in Palestine) as distinguished Epicureans in the time of Cicero. But the greatest of its Roman names was Lucretius, whose De rerum natura embodies the main teaching of Epicurus with great exactness, and with a beauty which the subject seemed scarcely to allow. Lucretius is a proof, if any were needed, that Epicureanism is compatible with a great deal of individuality, and it is probable that in nature of the time, with its active political struggles, naturally called Stoicism more into the foreground, yet Seneca, though nominally a Stoic, draws nearly all his suavity and much of his paternal wisdom from the writings of Epicurus. The position of Epicureanism as a recognized school in the 2nd century is best seen in the fact that it was one of the four schools (the others were the Stoic, Platonist, and Peripatetic) which were placed on a footing of equal endowment when Marcus Aurelius founded a college of philosophy at Athens. The evidence of Diogenes proves that it still subsisted as a school a century later, but its spirit lasted longer than its formal organization as a school. A great deal of the best of the Renaissance was founded on Epicureanism, and in more recent times a great number of prominent thinkers have been Epicureans in a greater or less degree. Among these may be mentioned Pierre Gassendi, who revived and codified the doctrine in the 17th century; Molière, the comte de Gournay, Rousseau, and Voltaire. All those whose ethical theory is in any degree hedonistic are to some extent the intellectual descendants of Epicurus (see HEDONISM).

Works.—Epicurus was a voluminous writer (σολογογραφείον, Diog. Laërt. x. 26)—the author, it is said, of about 300 works. He had a style and vocabulary of his own. His chief aim in writing was plainness and intelligibility, but his wish of order and logical precision thwarted his purpose. He pretended to
have read little, and to be the original architect of his own system, and the claim was no doubt on the whole true. But he had read Democritus, and, it is said, Anaxagoras and Archelaus. His works, we learn, were full of repetition, and critics speak of vulgarities of language and faults of style. None the less his writings were committed to memory and remained the textbooks of Epicureanism to the last. His chief work was a treatise on nature (Nepi φιλοσοφα), in thirty-seven books, of which fragments from about nine books have been found in the rolls discovered at Herculaneum, along with considerable treatises by several of his followers, and most notably Philodemus. An epitome of his doctrine is contained in three letters preserved by Diogenes.

AUTHORITIES.—The chief ancient accounts of Epicurus are in the tenth book of Diogenes Laertius, in Lucrècius, and in several treatises of Cicero and Plutarch. Gannazzi, in his De sta, mag. 185, et doctrina Epicuri (Lyons, 1647), and his Syntagma philosophiae Epicuri, systematized the doctrine. The Volumina Herculanensia (1st and 2nd series) contain fragments of treatises by Epicurus and members of his school. See also H. Ursen, Epicurea (Leipzig, 1887) and Epicuri recoginit specimen (Bonn, 1880); Epicurea phsica et meteorologiae (ed. J. G. Schneider, Leipzig, 1813); Th. Gomperz in his Hellenistische Studien, and in contributions to the Vienna Academy (Monatsberichte), has tried to evolve from the fragments more approximation to modern empiricism than they seem to contain. For English, see W. Wallace, Epicureanism (London, 1884); Epicurus; A Lecture (London, 1866); G. Trezza, Epicuro e l' Epicureismo (Florence, 1877; ed. Milan, 1885); E. Zeller, Philosophy of Greek Religion and Society (Eng. trans., London, 1879; ed. 1886); Sir James Mackintosh, On the Progress of the Ethical Philosophy (4th ed.); J. Watson, Hesiodic Theories (Glasgow, 1891); J. Kegren, Epicurus (Vienna, 1886); A. Goedeke, Epicurus (Stuttgart, 1887); F. Epicurean system (Gr. ἐπικουρή, upon, and κύκλος, circle), in ancient astronomy, a small circle the centre of which describes a larger one. It was especially used to represent geographically the periodic apparent retrograde motion of the outer planets, Mars, Jupiter and Saturn, which we now know to be due to the annual revolution of the earth around the sun, but which in the Ptolemaic astronomy were taken to be real.

Epicycloid, the curve traced out by a point on the circumference of a circle rolling externally on another circle. If the moving circle rolls internally on the fixed circle, a point on the circumference describes a "hypocycloid" (fromὑπό, under). The locus of any other carried point is an "epitrochoid" when the circle rolls externally, and a "hypotrochoid" when the circle rolls internally. The epitrochoid was so named by Römer in 1674, who also demonstrated that cog-wheels having epicycoidal teeth revolved with minimum friction (see Mechanics: Applied); this was also proved by Girard Desargues, Philippe de la Hire and Charles Stephen Louis Camus. Epicycloids also received attention at the hands of Edmund Halley, Sir Isaac Newton and others; spherical epicycloids, in which the moving circle is inclined at a constant angle to the plane of the fixed circle, were studied by the Bernoullis, Pierre Louis M. de Lapuerthuis, François Nicole, Alexis Claude Clairaut and others.

In the annexed figure, there are shown various examples of the curves named above, when the radii of the rolling and fixed circles are in the ratio of 1 to 3. Since the circumference of a circle is proportional to its radius, it follows that the ratio of the radii be commensurable, the curve will consist of a finite number of cusps, and ultimately return into itself. In the particular case when the radii are in the ratio of 1 to 3 the epicycloid (curve a) will consist of three cusps external to the circle and placed at equal distances along its circumference. Similarly, the corresponding epitrochoids will exhibit three loops or nodes (curve b), or assume the form shown in the figure. It is interesting to compare the forms of these curves with the three forms of the cycloid (c.e.). The hypocycloid derived from the same circles is shown as curve d, and is seen to consist of three cusps arranged internally to the fixed circle; the corresponding hypotrochoid consists of a three-fold and is shown in curve e. The hypocycloid shown is termed the "three-cusped epicycloid" or the "epicycloid of Cremona."

The cartesian equation to the epicycloid assumes the form

\[ x = (a + b) \cos \theta - b \cos \left( \frac{a + b}{b} \theta \right), \quad y = (a + b) \sin \theta - b \sin \left( \frac{a + b}{b} \theta \right), \]

where the centre of the fixed circle is the origin, and the axis of \( x \) passes through the initial point of the curve (i.e. the original position of the moving point on the fixed circle), \( a \) and \( b \) being the radii of the fixed and rolling circles, and \( \theta \) the angle through which the line joining the centres of the two circles has passed. It may be shown that if the distance of the carried point from the centre of the rolling circle is \( \rho = A \sin \beta \theta \) or \( \rho = A \cos \beta \theta \), the constant \( A \) and \( B \) being readily determined by the above considerations.

If, e.g., the radius of the rolling circle be one-half of the fixed circle, the hypocycloid becomes a diameter of this circle; this may be confirmed from the equation to the hypocycloid. If the ratio of the radii be as 1 to 4, we obtain the fourth epicycloid, which has the simple cartesian equation \( x^4 + y^4 = a^4 + b^4 \). This curve is the envelope of a line of constant length, which moves so that its extremities are always on two fixed lines at right angles to each other, i.e., of the line \( x + y = a \), with the condition \( a^4 + b^4 = t \), a constant. The epicycloid when the radii of the circles are equal is the cardioid (q.v.), and the corresponding trochoidal curves are limacons (q.v.). Epicycloids are also examples of certain caustics (q.v.). For the methods of determining the formulae and results stated above see J. Edwards, Differential Calculus, and for geometrical constructions see T. H. Eagles, Plane Curves.

EPIDAURUS, the name of two ancient cities of southern Greece.

1. A maritime city situated on the eastern coast of Argolis, sometimes distinguished as Ἠραλού "Eraloos," or Epidauros or the Holy. It stood on a small rocky peninsula with a natural harbour on the northern side and an open but serviceable bay on the southern; and from this position acquired the epithet of Ἱερού, or the two-mouthed. Its narrow but fertile territory consisted of a plain shut in on all sides except towards the sea by considerable elevations, among which the most remarkable were Mount Arachneon and Tritthon. The conterminous states were Corinth, Argos, Trozen and Hermione. Its proximity to Athens and the islands of the Saronic gulf, the commercial advantages of its position, and the fame of its temple
of Asclepius combined to make Epidaurus a place of no small importance. Its origin was ascribed to a Carian colony, whose memory was possibly preserved in Epicurus, the earlier name of the city; it was afterwards occupied by Ionians, and appears to have incorporated a body of Phlegraans from Thessaly. The Ionians in turn succumbed to the Dorians of Argos, who, according to the legend, were led by Deiphontes; and from that time the city continued to preserve its Dorian character. It not only colonized the neighbouring islands, and founded the city of Aegina, by which it was ultimately outstripped in wealth and power, but also took part with the people of Argos and Troezen in their settlements in the south of Asia Minor. The monarchical government introduced by Deiphontes gave way to an oligarchy, and the oligarchy degenerated into a despotism. When Procles the tyrant was carried captive by Periander of Corinth, the oligarchy was restored, and the people of Epidaurus continued ever afterwards close allies of the Spartan power. The governing body consisted of 180 members, chosen from certain influential families, and the executive was entrusted to a select committee of aristoi (from aris, to manage). The rural population, who had no share in the affairs of the city, were called soi xnetes ("dusty-feet"). Among the objects of interest described by Pausanias as extant in Epidaurus are the image of Athena Cissa in the Acropolis, the temple of Dionysus and Artemis, a shrine of Aphrodite, statues of Asclepius and his wife Epione, and a temple of Hera. The site of the last is identified with the chapel of St Nicolas; a few portions of the outer walls of the city can be traced; and the name Epidaurus is still preserved by the little village of Nea-Epidauros, or Epidauro.

The Hieron (sacred precinct) of Asclepius, which lies inland about 8 m. from the town of Epidaurus, has been thoroughly excavated by the Greek Archaeological Society since the year 1891, under the direction of M. Kavvadias. In addition to the sacred precinct, with its temples and other buildings, the theatre and stadium have been cleared; and several other extensive buildings, including baths, gymnasia, and a hospital for invalids, have also been found. The sacred road from Epidaurus, which is flanked by tombs, approaches the precinct through a gateway or propylaea. The chief buildings are grouped together, and include temples of Asclepius and Artemis, the Tholos, and the Abaton, or portico where the patients slept. In addition to remains of architecture and sculpture, some of them of high merit, there have been found many inscriptions, throwing light on the cures attributed to the god. The chief buildings outside the sacred precinct are the theatre and the stadium.

The temple of Asclepius, which contained the gold and ivory statue by Thrasymedes of Paros, had six columns at the ends and eleven at the sides; it was raised on stages and approached by a ramp at the eastern front. An inscription has been found recording the contracts for building this temple; it dates from
about 460 B.C. The sculptor Timotheus—one of those who collaborated in the Mausoleum—is mentioned as undertaking to make the acroteria that stood on the ends of the pediments, and also models for the sculpture that filled up the rest. Some of this acroteria has been found; the acroteria are Nereids mounted on sea-horses, and one pediment contained a battle of Greeks and Amazons. The great altar lay to the south of the temple, and a little to the east of it are what appear to be the remains of an earlier altar, built into the corner of a large square edifice of Roman date, perhaps a house of the priests. Just to the south of this are the foundations of a small temple of Artemis. The Tholos lay to the south-west of the temple of Asclepius, and when perfect, has been one of the most beautiful buildings in Greece; the exquisite carving of its mouldings is only equalled by that of the Erechtheum at Athens. It consisted of a circular chamber, surrounded on the outside by a Doric colonnade, and on the inside by a Corinthian one. The architect was Polycletus, probably to be identified with the younger sculptor of that name. In the inscription recording the contracts for its building it is called the Thymele; and this name may give the clue to its purpose; it was probably the idealised architectural representative of a primitive pit of sacrifice, such as may still be seen in the Asclepium at Athens. The foundations now visible present a very curious appearance, consisting of a series of concentric walls. Those in the middle are thin, having only the pavement of the cela to support, and are provided with doors and partitions that make a sort of subterranean labyrinth. There is no evidence for the statement sometimes made that there was a well or spring below the Tholos. North of the Tholos is the long portico described in inscriptions as the Abaton; it is on two different levels, and the lower or western portion of it had two storeys, of which the upper one was on a level with the ground in the eastern portion. Here the invalids used to sleep when consulting the god, and the inscriptions found here record not only the method of consulting the god, but the manner of his cures. Some of the inscriptions are contemporary dedications; but those which give us most information are long lists of cases, evidently compiled by the priests from the dedications in the sanctuary, or from tradition. There is no reason to doubt that most of the records have at least a basis of fact, for the cases are in accord with well-attested phenomena of a similar nature at the present day; but there are others, such as the miraculous mending of a broken vase, which suggest either invention or trickery.

In early times, though there is considerable variety in the case of the sanctuaries of other gods, there are certain characteristics common to the majority of the cases. The patient consulting the god sleeps in the Abaton, sees certain visions, and, as a result, comes forth cured the next morning. Sometimes there seem to be surgical cases, like that of a man who had a spear-head extracted from his jaw, and found it laid in his hands when he awoke in the morning, and there are many examples resembling those known at the present day at Lourdes or Tenos, where hysterical or other similar affections are cured by the influence of imagination or sudden emotion. It is, however, difficult to make any scientific use of the records, owing to the indiscriminate manner in which genuine and apocryphal cases are mingled, and circumstantial details are added. We learn the practice of later times from some dedicated inscriptions. Apparently the old faith-healing had lost its efficacy, and the priests substituted for it elaborate prescriptions as to diet, baths and regimen which must have made Epidaurus and its visitors resemble their counterparts in a modern spa. At the time there were extensive buildings provided for the accommodation of invalids, some of which have been discovered and partially cleared; one was built by Antoninus Pius. They were in the form of great courtyards surrounded by colonnades and chambers. Between the precinct and the theatre was a large gymnasion, which has in later times been converted to other purposes, a small stadium being built in the middle of it. In a valley just to the south-west of the precinct is the stadium, of which the seats and goal are well preserved. There is a gutter round the level space of the stadium, with basins at intervals for the use of spectators or competitors, and a post at every hundred feet of the course, thus dividing it into six portions. The goal, however, is well preserved, is similar to that at Olympia; it consists of a sill of stone sunk level with the ground, with parallel grooves for the feet of the runners at starting, and sockets to hold the posts that separated the spaces assigned to the various competitors of the race. For these were substituted later a set of stone columns resembling those in the prosenium of a theatre. There was doubtless a similar well below the end for the archers, which is well preserved at the upper one being intended for the start of the diaulos and longer races.

The theatre still deserves the praise given it by Pausanias as the most magnificent in Greece. The preservation of the structure is extraordinarily good, a speaker in the orchestra being heard throughout the auditorium without raising his voice. The stage buildings are not preserved much above their foundations, and show signs of later repairs; but their general character can be clearly seen. They consist of a long rectangular building, with a prosenium or column front which almost forms a tangent to the circle of the orchestra; at the middle and at either end of this prosenium are doors leading into the orchestra, those at the end set in projecting niches, and the lower part of the orchestra is supported by pillars. The orchestra is the structure of the known by Professor W. Loeschcke, who excavated the theatre, believes that the prosenium is contemporary with the rest of the theatre, which, like the Tholos, was built by Polycletus (the youngest of the brothers), and that it is a later addition. In any case, the theatre at Epidaurus ranks as the most typical of Greek theatres, both from the simplicity of its plan and the beauty of its proportions.

See Pausanias i, 9, 10; Epitome de la Monti, ii; Curtius, Peloponnesus, ii; Transactions of Roy. Soc. of Lit., 2nd series, vol. ii; Weclawski, De rebus Epidauriis (Wenen, 1854).

The excavations at the Heraion have been recorded as they went on in the Pastrav of the Greek Archaeological Society, especially for 1881-1884 and 1886, and also in the "Fotografia Archeologica, especially 1881, 1883, 1885, 1887, and 1888; see also L. Sciaparelli, La Heraion d'Epidauro e Le Tene' 'gion'di' Epidauro, and P. E. De Pauw, Les Excavations du sanctuaire d'Epidauri et la Peinture de la moera, Deprasse and Lechat, Epidaurus. A museum was completed in 1910.

2. A city of Peloponnesus on the east coast of Laconia, distinguished by the epithet of Limera (either "The Well-havened" or "The Hungry"). It was founded by the people of Epidaurus the Holy, and its principal temples were those of Asclepius and Aphrodite. It was abandoned during the middle ages; its site was taken possession of by the pirates, and then turned into an island, and built and fortified thereon the city of Monembasia, which became the most flourishing of all the towns in the Morea, and gave its name to the well-known Malmsey or Malvasia wine. The ruins of Epidaurus are to be seen now called Palaea Monemvasia.

A third Epidaurus was situated in Illyricum, on the site of the present Ragusa Vecchia; but it is not mentioned till the time of the civil wars of Pompey and Caesar, and has no special interest.

EPIIDORITE, in petrology, a typical member of a family of rocks consisting essentially of hornblende and felspar, often with epidote, garnet, spherne, biotite, or quartz, and having usually a foliated structure. The term is somewhat synonymous with "amphibolite" and "hornblende-schist." These rocks are metamorphic, and though having a mineral constitution somewhat similar to that of diorite, they have been brought up more from a state of granite rather, such as diabase, dolerite and gabbro. They occur principally among the schists, slates and gneisses of such districts as the Scottish Highlands, the north-west of Ireland, Britannia, the Harz, the Alps, and the crystalline ranges of eastern N. America. Their hornblende in microscopic section is usually dark green, rarely brownish; their felspar may be clear or recrystallized, but more frequently is converted into a turbid aggregate of epidote, zoisite, quartz, sercite and albite. In the less complete stages of alteration, optically may persist, and the original augite of the rock may not have been entirely replaced by
hornblende. Pink or brownish garnets are common and may be an inch or two in diameter. The iron oxides, originally limey, are usually altered to sphere. Biotite, if present, is brown; epidote is yellow or colourless; rutile, apatite and quartz all occur with some frequency. The essential minerals, hornblende and felspar, rarely show crystalline outlines, and this is generally true of the other minerals. The textural evidences of their constituents are hardly visible to the unaided eye; or may show crystals of hornblende an inch in length. Their prevalent colour is dark green and they weather with brown surfaces. In many parts of the world epidotites and the quartz veins which sometimes occur in them have proved to be auriferous. As they are tough, hard rocks, when fresh, they are well suited for use as road-mending stones.

**EPIDOTE**, in petrology, a typical member of a family of metamorphic rocks composed mainly of epidote and quartz. In colour they are pale yellow or greenish yellow, and they are hard and somewhat brittle. They may occur in more than one way and are derived from several kinds of rock. Some have been epidotic gneisses and sandstones; others are limestones which have undergone contact-alteration; probably the majority, however, are allied to epidotite and amphibolite, and are local modifica of the rocks which they were mainly basaltic or trachytic. The sedimentary epidotites occur with mica-schists, sheared gneisses and granite gneisses; they often show, on minute examination, the remains of clastic structures. The epidotites derived from limestones may contain a great variety of minerals such as calcite, augite, garnet, scapolite, &c., but their source may usually be inferred from their close association with calc-silicate rocks in the field. The third group of epidotites may form bands, veins, or irregular streaks and nodules in masses of epidotite and hornblende-schist. In microscopic section, they are often merely a granular mosaic of quartz and epidote with some iron oxides and chlorite, but in other cases they retain much of the structure of the original rock though there has been a complete replacement of the former minerals by new ones. Epidotites when streaked and variegated have been cut and polished as ornamental stones. They are translucent and hard, and hence serve for brooch stones, and the simpler kinds of jewellery. These rocks occasionally carry gold in visible yellow specks.

**EPIDOTE**, a mineral species consisting of basic calcium, aluminium and iron orthosilicate, Ca2(AlO2)(Fe3O4), crystallizing in the monoclinic system. Well-developed crystals are of frequent occurrence: they are commonly prismatic in habit, the direction of elongation being perpendicular to the single plane of symmetry. The faces lettered M, T and r in the figure are often deeply striated in the same direction: M is a direction of perfect cleavage, and T of imperfect cleavage: crystals are often twinned on the face T. Many of the characters of the mineral vary with the amount of iron present (Fe3O4, 5:17%), for instance, the colour, the optical constants, and the specific gravity (3:3-3). The hardness is 6:]. The colour is green, grey, brown or nearly black, but usually a characteristic shade of yellowish-green or pistachio-green. The pleochroism is strong, the pleochroic colours being usually green, yellow and brown. The names thallite (from θάλλης, "a young shoot") and pistacite (from πισταχίον, "pistachio nut") have reference to the colour. The name epidote is one of R. J. Haüy's crystallographic names, and is derived from εἶπεν, "increase," because the base of the primitive prism has one side longer than the other. Several other minerals (e.g. eschermite, lasioglasite, &c.) have been applied to this species. Withamite is a carmine-red to straw-yellow, strongly pleochroic variety from Glencoe in Scotland. Fouquetite and clinozoisite are white or pale rose-red varieties containing very little iron, thus having the same chemical composition as the orthohombic mineral zoisite (q.v.). Epidote is an abundant rock-forming mineral, but one of secondary origin. It occurs in crystalline limestones and schistose rocks of metamorphic origin; and is also a product of weathering of various minerals (felspars, micas, pyroxenes, amphiboles, garnets, &c.) composing igneous rocks. A rock composed of quartz and epidote is known as epidotite. Well-developed crystals are found at many localities, of which the following are typical: Epidotite occurs at the Tschermes, some 80 miles north of the Gross-Venediger in the Untersteierbachtal in Salzburg, as magnificient, dark green crystals of long prismatic habit in cavities in epidotite, with asbestos, adularia, calcite, and apatite; the Aia Valley and Travessera in Piedmont; Ardal in Norway (Arendalite); Le Bourg d'Oisans in Dauphiné (oisanite and delphinite); Haddam in Connecticut; Prince of Wales Island in Alaska, here as large, dark green, tabular crystals with copper oxide in metamorphosed limestone. The perfectly transparent, dark green crystals from the Knappenwand and from Brasil have occasionally been cut as gems.

Belonging to the same isomorphous group with epidote are the species prieudonite and allanite, which may be described as manganese and cerium epidotes respectively.

Prieudonite has the composition Ca2(AlO2)(Fe3O4)2, where R" represents calcium and ferrous iron, and R"" aluminium, ferric iron and metals of the cerium group. In external appearance it differs widely from epidote, being black or dark brown in colour, pitchy in lustre, and opaque in the mass; further, there is little or no cleavage, and well-developed crystals are rarely met with. The crystallographic and optical characters are similar to those of epidote; the pleochroism is strong with reddish, yellowish-, and greenish-brown colours. Although not a common mineral, allanite is of fairly wide distribution as a primary accessory constituent of many crystalline rocks, e.g. gneisses, granite, syenite, rhyolite, andesite, &c. It was first found in the granite of east Greenland and described by Thomas Allan in 1806, after whom the species was named. Allanite is a mineral readily altered by hydration, becoming optically isotropic and amorphous: for this reason several varieties have been distinguished, and many different names applied. Orthite, from ορθός, "straight," was the name given by J. J. Berzelius in 1818 to a hydrated form found as slender prismatic crystals, sometimes a foot in length, at Finbo, near Falun in Sweden.

**EPIGONION** (Gr. ἐπίγονον, "descendants"), in Greek legend, the sons of the seven heroes who fought against Thebes (see ABDASTUS). Ten years later, to avenge their fathers, the Epigonion undertook a second expedition, which was completely successful. Thebes was forced to surrender and razed to the ground. In early times the war of the Epigonion was a favourite subject of epic poetry. The term is also applied to the descendants of the Diodochi, the successors of Alexander the Great.

**EPIGNION** (Gr. ἐπίγονιον), an ancient stringed instrument mentioned in Athenaeus 185 C, probably a psaltery. The epignion was invented, or at least introduced into Greece, by Epignus, a Greek musician of Ambraica in Epirus, who was admitted to citizenship at Sycaon as a recognition of his great musical ability and of his having been the first to pluck the strings with his fingers, instead of using the plectrum.1 The instrument, which Epignus named after himself, had forty strings.2 It was probably similar to a psaltery, since an instrument of so many strings some must have been of different lengths, for tension and thickness only could hardly have produced forty different sounds, or even twenty, supposed that they were arranged in pairs of unisons. Strings of varying lengths require

2 Pollux, Onomasticon, lib. iv. cap. 9, 59.
of the wisdom of the ages, a bon mot set off with a couple of rhymes.

"I cannot tell thee who lies buried here; No man that knew him followed by his bier; The winds and waves conveyed him to this shore, Then ask the winds and waves to tell thee more." ANONYMOUS.

"Wherefore should I vainly try To teach thee what my love will be In after years, when thou and I Have both grown old in company, If words are vain to tell thee how, Mary, I do love thee now?" ANONYMOUS.

"O Brucus, cease our aching ears to vex, With thy loud railing at the softer sex; No accusation worse than this could be That once a woman did give birth to thee." ACILUS.

"Treason doth never prosper. What's the reason? For it if prosers none dare call it treason." HARINGTON.

"Ward has no heart they say, but I deny it; He has a heart, and gets his speeches by it." ROGERS.

From its very brevity there is no small danger of the epigram passing into childish triviality: the palteriest pun, a senseless anagram, is considered stuff enough and to spare. For proof of this there is unfortunately no need to look far; but perhaps the reader could not find a better collection ready to his hand than the second twenty-five of the Epigrammata centuriae of Samuel Erichius; by the time he reaches No. 11 of the 47th century, he will be quite ready to grant the appropriateness of the identity maintained between the German Sede, or soul, and the German See, or ass.

Of the epigram as cultivated by the Greeks an account is given in the article ANTHROPOLOGY, discussing those wonderful collections which bid fair to remain the richest of their kind. The delicacy and simplicity of so much of what has been preserved is perhaps their most striking feature; and one cannot but be surprised at the number of poets proved capable of such work. In Latin literature, on the other hand, the epigrammatists whose work has been preserved are comparatively few, and though several of them, as Catullus and Martial, are men of high literary genius, too much of what they have left behind is vitiated by brutality and obscenity. On the subsequent history of the epigram, indeed, Martial has exercised an influence as baneful as it is extensive, and he may fairly be counted the far-off progenitor of a host of scurrilous verses. Nearly all the learned Latinists of the 16th and 17th centuries may claim admittance into the list of epigrammatists and Scribleri, Buchanan and More, Strozio and Sannazzaro. Melanchthon, who succeeded in combining so much of Pagan culture with his Reformation Christianity, has left us some graceful specimens, but his editor, Joannes Major Joachimus, has so little idea of what an epigram is, that he includes in his collection some translations from the Psalms. The Latin epigrams of Etienne Pasquier were among the most admirable which the Renaissance produced in France. John Owen, or, as he Latinized his name, Johannes ADoctorus, a Cambro-Briton, attained quite an unusual celebrity in this department, and is regularly distinguished as Owen the Epigrammatist. The tradition of the Latin epigram has been kept alive in England by such men as Porson, Vincent Bourne and Walter Savage Landor. Happily there is now little danger of any too personal epigrammatist suffering the fate of Niccolo Franco, who paid the forfeit of his life for having launched his venomous Latin against Pius V., though he may still incur the milder penalty of having his name inserted in the Index Expurgoratorius, and find, like John Owen, that he consequently has lost an inheritance.

In English literature proper there is no writer like Martial in Latin or Logau in German, whose fame is entirely due to his epigrams; but several even of those whose names can perish never have not disdained this diminutive form. The designation epigram, however, is used by earlier English writers with excessive laxity, and given or withheld without apparent reason.

1 For an illustration, see Kathleen Schlesinger, Orchestral Instruments, part ii. "Precursors of the Violin Family," fig. 165, p. 219.

3 Diologo della musica antica e moderna, ed. 1603, p. 40.
The epigrams of Robert Crowley (1550) and of Henry Parrot (1613) are worthless so far as form goes. John Weever’s collection (1596) is of interest mainly because of its allusion to Shakespeare. Ben Jonson furnishes a number of noble examples in his Underwoods; and one or two of Spenser’s little poems and a great many of Herrick’s are properly classed as epigrams. Cowley, Waller, Dryden, Prior, Parnell, Swift, Addison, Johnson, Goldsmith and Young have all been at times successful in their epigrammatical attempts; but perhaps none of them has proved himself so much “to the manner born” as Pope, whose name indeed is almost identified with the epigrammatical spirit in English literature. Few English modern poets have followed in his footsteps, and though nearly all might plead guilty to an epigram or two, there is no one who has a distinct reputation as an epigrammatist. Such a reputation might certainly have been Landor’s, had he not chosen to write the best of his minor poems in Latin, and thus made his readers nearly as select as his language.

The French are undoubtedly the most successful cultivators of the “salt” and the “vinaigre” epigram; and from the 16th century downwards many of their principal authors have earned no small celebrity in this department. The epigram was introduced into French literature by Mellin de St Gelaia and Clément Marot. It is enough to mention the names of Boileau, J. B. Rousseau, Lebrun, Voltaire, Marmontel, Piron, Ruhlire, and M. J. Chénier. In spite of Rapin’s dictum that a man ought to be content if he succeeded in writing one really good epigram, that number of splendid examples has been so large that proportion of them would doubtless pass muster even with Rapin himself. If Piron was never anything better, “pas même académicien,” he appears at any rate in Grimm’s phrase to have been “une machine à saillies, à épigrammes, et à bons mots.” Perhaps more than anywhere else the epigram has been recognized in France as a regular weapon in literary and political contests, and it might not be altogether a hopeless task to compile an epigrammatic history from the Revolution to the present time.

While any fair collection of German epigrams will furnish examples that for keenness of wit would be quite in place in a French anthology, the Teutonic tendency to the moral and didactic has given rise to a class but sparingly represented in French. The very name of Simmgedichte bears witness to this peculiarity, which is exemplified equally by the rude priemel or prosaismen, of the 13th and 14th centuries and the polished lines of Goethe or Schiller. Logau published his Deutsche Simmgedichten und Prosaismen of 1654, and Winckel no fewer than six volumes of Ueberschriften oder Epigrammata in 1687; Kästner’s Simmgedichte appeared in 1783, and Haug and Weissen’s Epigrammatische Anthologie in 1804. Kleist, Opitz, Gleim, Hagedorn, Klopa stock and A. W. Schlegel all possess some reputation as epigrammatists; Lessing is facile princeps in the satirical style; and Herder has the honour of having enriched his language with much of what is best from Oriental and classical sources.

It is often by no means easy to trace the history of even a single epigram, and the investigator soon learns to be cautious of congratulating himself on the attainment of a genuine original. The same point, refurbished and fitted anew to its tiny shaft, has been shot again and again by laughing cupids or fierce-eyed furies in many a frolic and many a fray. During the period when the epigram was the favourite form in Germany, Gervinus tells us how the works, not only of the Greek and Roman writers, but of Neo-Latinists, Spaniards, Dutchmen, Frenchmen, Englishmen and Poles were ransacked and plundered; and the same process of pillage has gone on in a more or less modified degree in other times and countries. Very noticeable often are the modifications of tone and expression occasioned by national and individual characteristics; the simplicity of the prototype may become common-place in the imitation, the sublme be distorted into the grotesque, the pathetic degenerate into the absurdly sentimental; or on the other hand, an unpromising motif may be happily developed into unexpected beauty. A good illustration of the variety with which the same epigram may be translated and travestied is afforded by a little volume published in Edinburgh in 1808, under the title of Lucrations on the Epigram—

Et qui se vert, se sait avoir,
Et qui se sait avoir,
Soit qui se sait avoir,
Soit qui se sait avoir.

The two collections of epigrams most accessible to the English reader are Booth’s Epigrams, Ancienw and Modern (1863) and Dodd’s The Epigrammatists (1870). In the appendix to the latter is a pretty full bibliography, to which the following list may serve as a supplement:

Thomas Corrander, Poetorum Italiae epigrammata dictiur (Venice, 1559; Bologna, 1590); Cottunius, De conficiendo epigrammate (Bologna, 1632); Vincentius Gallius, Opusculum de Parnasso (Milan, 1604); Vavonier, De epigrammate liber (Paris, 1662); Gedanken von deutschen Epigrammati 1sleip (Leipzig, 1690); Dociissimuror nostra adeo Iatlorum epigrammata; Flaminii Moleae Neugeri, Colae, Lampridii, Sololati, et aliorum, cura Jo. Gognari (Paris, c. 1550); Brugière de Barante, Recueil des plus belles épigrammes des poètes français (2 vols., Paris, 1692); Chr. Aug. Heumann, Anthologia Latina: hoc est, epigrammatar partis privati partem junioribus a pessi (Hannover, 1721); Payolle, Acanthologie ou dictionnaire d’épigrammes (Paris, 1817); Geijssbeek, Epigrammatische Anthologie, Sauvegar, Les Gukpes gauiloses: petit encyclopédie des meilleurs épigrammes, etc., depuis Clément Marot jusqu’aux poètes de nos jours (1884); La Récradiation et passe-temps des tristes: recueil d’épigrammes et de petits contes en vers réprimés sur l’édition de Rouan 1595, etc. (Paris, 1893). A large number of epigrams and other miscellaneous inscriptions are given in his work, and application and translation is scattered through Notes and Queries.

See also an article in The Quarterly Review, No. 231.

EPYGRAPH (Gr. εύγραφος, to write), a term used to denote (1) the science connected with the making and use of letters, and 2) the science connected with the classification and explanation of inscriptions. It is sometimes employed, too, in a more contracted sense, to denote the paleography, or inscriptions. Generally, it is that part of archaeology which has to do with inscriptions engraved on stone, metal or other permanent material (not, however, coins, which come under the heading NUMISMATICS).

See INSCRIPTIONS; PALAEOGRAPHY.

EPELEPSY (Gr. ἐπιλέπσεως, to seize), or FALLING SICKNESS, a term applied generally to a nervous disorder, characterized by a fit of sudden loss of consciousness, attended with convulsions. There may, however, exist manifestations of epilepsy much less marked than this, yet equally characteristic of the disease; while, on the other hand, it is to be borne in mind that many other attacks of a convulsive nature have the term “epileptic” or “epileptiform” applied to them.

Epilepsy was well known in ancient times, and was regarded as a special infliction of the gods, hence the name of haruspex or morbus divus. It was also termed morbus Hercules, from Hercules having been supposed to have been epileptic, and morbus comitialis, from the circumstance that when any member of the forum was seized with an epileptic fit the assembly was broken up. Morbus caducus, morbus tunasicus astraenis, morbus demoniacus, morbus major, were all terms employed to designate epilepsy.

There are three well-marked varieties of the epileptic seizure; to these the terms le grand mal, le petit mal and Jacksonian epilepsy are usually applied. Any of these may exist alone, but the two former may be found to exist in the same individual. The first of these, if not the more common, is at least that which attracts the most attention, being what is generally known as an epileptic fit.

Although in many instances such an attack comes on suddenly, it is in many cases preceded by warning premonitory indications or warnings, which may be present for a greater or less time previously. These are of very varied character, and may be in the form of some temporary change in the disposition, such as unusual depression or elevation of spirits, or of some alteration in the look. Besides these general symptoms, there are frequently peculiar sensations which immediately precede the onset of the fit, and to such the name of aura epileptica is applied. In its strict sense this term refers to a feeling of a breath of air blowing against the head, or some part of the body, such as a cold blow on the head. This sensation, however, is not a common one, and the term has now come to be applied to any peculiar feeling which the
EPILEPSY

patient experiences as a precursor of the attack. The so-called aura may be of mental character, in the form of an agonizing feeling of momentary duration; of sensorial character, in the form of pain in a limb or in some internal organ, such as the stomach, or morbid feeling connected with the special senses; or, further more, as motor character, in the form of contractions or trembling in some of the muscles. When such sensations affect a limb, the employment of firm compression by the hand or by a ligature occasionally succeeds in warding off an attack. The aura may be so distinct and of such duration as to enable the patient to lie down, or seek a place of safety before the fit comes on.

The seizure is usually preceded by a loud scream or cry, which is not to be ascribed, as was at one time supposed, to terror or pain, but is due to the convulsive action of the muscles of the larynx, and the expulsion of a column of air through the narrowed glottis. If the patient is standing he immediately falls, and often sustains serious injury. Unconsciousness is complete, and the muscles generally are in a state of stiffness or tonic contraction, which will usually be found to affect those of one side of the body in particular. The head is turned by a series of jerks towards one or other shoulder, the breathing is for the moment arrested, the convulsive wave then breaks, and the pupils dilate and the pulse quickens and becomes rapid. This, the first stage of the fit, generally lasts for about half a minute, and is followed by the state of clonic (i.e. tumultuous) spasm of the muscles, in which the whole body is thrown into violent agitation, occasionally so great that bones may be fractured or dislocated. The eyes roll wildly, the teeth are grashed together, and the tongue and cheeks are often severely bitten. The breathing is noisy and laborious, and foam (often tinged with blood) issues from the mouth, while the contents of the bowels and bladder are ejected. The aspect of the patient in this condition is shocking to witness, and the sight has been known to induce a similar attack in an onlooker. This stage lasts for a period varying from a few seconds to several minutes, when the convulsive movements gradually subside, and relaxation of the muscles takes place, together with partial return of consciousness, the patient looking confusedly about him and attempting to speak. This, however, is soon followed by drowsiness and stupor, which may continue for several hours, when he awakes either apparently quite recovered or fatigued and depressed, and occasionally in a state of excitement which sometimes assumes the form of mania.

Epileptic fits of this sort succeed each other with varying degrees of frequency, and occasionally, though not frequently, with regular periodicity. In some persons they only occur once in a lifetime, or once in the course of many years, while in others they return every week or two, or even are of daily occurrence, and are not infrequent. According to Sir J. R. Reynolds, there are four times as many epileptics who have their attacks more frequently than once a month as there are of those whose attacks recur at longer intervals. When the fit returns it is not uncommon for one seizure to be followed by another within a few hours or days. Occasionally there occurs a constant succession of attacks extending over many hours, and with such rapidity that the patient appears as if he had never come out of the one fit. The term status epilepticus is applied to this condition, which, if it continues for 24 hours with fatal results. In many epileptics the fits occur during the night as well as during the day, but in some instances they are entirely nocturnal, and it is well known that in such cases the disease may long exist and yet remain unrecognized either by the patient or the physician.

The second manifestation of epilepsy, to which the names epilepsia minor or le petit mal are given, differs from that above described in the absence of the convulsive spasm. It is also termed by some authors epileptic vertigo (giddiness), and consists essentially in the sudden arrest of volition and consciousness, which is of but short duration, and may be accompanied with staggering or some alteration in position or motion, or may simply exhibit itself in a look of absence or confusion, and should the patient happen to be engaged in conversation, by an abrupt termination of the act. In general it lasts but a few seconds, and the individual resumes his occupation without perhaps being aware of anything having been the matter. In some instances there is a degree of spasmodic action in certain muscles which may cause the patient to make some unexpected movement, such as falling an object on the floor, or turning abruptly to the left, or may be evidenced by some unusual expression of countenance, such as squinting or grinning. There may be some amount of aura preceding such attacks, and also of faintness following them. The petit mal most commonly co-exists with the grand mal, but has no necessary connexion with it, as each may exist alone. According to Armand Trousseau, the petit mal in general precedes the manifestation of the grand mal, but sometimes the reverse is the case.

The third manifestation—Jacksonian epilepsy or partial epilepsy—is distinguished by the fact that consciousness is retained or lost late. The patient is conscious throughout, and is able to watch the march of the spasms. The attacks are usually the result of lesions in the motor area of the brain, such being caused, in many instances, by depression of the vault of the skull, due to trauma.

Epilepsy appears to exert no necessarily injurious effect upon the general health, and even where it exists in an aggravated form is not incompatible with a high degree of bodily vigour. It is very different, however, with regard to its effect upon the mind; and the question of the relation of epilepsy to insanity is one of great and increasing importance. Allusion has already been made to the occasional occurrence of maniacal excitement as one of the results of the epileptic seizure. Such attacks, to which the name of furor epilepticus is applied, are generally accompanied with violent acts on the part of the patient, rendering him dangerous, and demanding prompt measures of restraint. These attacks are by no means limited to the more severe form of epilepsy, but appear to be even more frequently associated with the milder form—the epileptic vertigo—where they either replace altogether or immediately follow the short period of absence characteristic of this form of the disease. Numerous cases are on record of persons known to be epileptic being suddenly seized, either after or without apparent spasmatic attack, with some sudden impulse, in which they have used dangerous violence to those beside them, irrespective altogether of malevolent intention, as appears from their retaining no recollection whatever, after the short period of excitement, of anything that had occurred; and there is reason to believe that crimes of heinous character, for which the perpetrators have suffered punishment, have been committed in a state of mind such as that now described. The subject is obviously one of the greatest medico-legal interest and importance in regard to the question of criminal responsibility.

The third form, from which marked and comparatively rare instances of what is termed epileptic insanity, the general mental condition of the epileptic is in a large proportion of cases unfavourably affected by the disease. There are doubtless examples (and their number according to statistics is estimated at less than one-third) where, even among those suffering from frequent and severe attacks, no departure from the normal condition of mental integrity can be recognized. But in general there exists some peculiarity, exhibiting itself either in the form of defective memory, or of defective reasoning, or in some connection with the clinical experience. It is perhaps as frequent, in irregularities of temper, the patient being irritable or perverse and eccentric. In not a few cases there is a steady mental decline, which ends in dementia or idiocy. It is stated by some high authorities that epileptic women suffer in regard to their mental condition more than men. It also appears to be the case that the later in life the disease shows itself the more likely is the mind to suffer. Neither the frequency nor the severity of the seizures seems to have any necessary influence in the matter; and the general opinion appears to be that the milder form of the disease is that with which mental failure is more apt to be associated. (For a consideration of the conditions of the nervous system which result in epilepsy, see the article NEUROPATHOLOGY.)

The influence of hereditary predisposition in epilepsy is very
marked. It is necessary, however, to bear in mind the point so forcibly insisted on by Trouseau in relation to epilepsy, that hereditary transmission may be either direct or indirect, that is to say, that what is epilepsy in one generation may be some other form of neurosis in the next, and conversely, nervous diseases being remarkable for their tendency to transformation in their descent in families. Where epilepsy is hereditary, it generally manifests itself at an unusually early period of life. A singular fact, which also bears to some extent upon the pathology of this disease, was brought to light by Dr Brown Séquard in his experiments, namely, that the young of animals which had been artificially rendered epileptic were liable to similar seizures. In connexion with the hereditary transmission of epilepsy it must be observed that all authorities concur in the opinion that this disease is one among the baneful effects that often follow marriages of consanguinity. Further, there is reason to believe that intemperance, apart altogether from its direct effect in favouring the occurrence of epilepsy, has an evil influence in the hereditary transmission of this as of other nervous diseases. A want of symmetry in the formation of the skull and defective cerebral development are not infrequently observed where epilepsy is hereditarily transmitted.

Age is of importance in reference to the production of epilepsy. The disease may come on at any period of life, but it appears from the statistics of Reynolds and others, that it most frequently first manifests itself between the ages of ten and twenty years, the period of second dentition and puberty, and again at or about the age of forty.

Among other causes which are influential in the development of epilepsy may be mentioned sudden fright, prolonged mental anxiety, over-work and debauchery. Epileptic fits also occur in connexion with a depraved stage of the general health, and with irritations in other organs, as seen in the fits occurring in dentition, in kidney disease, and as a result of worms in the intestines. The symptoms traceable to these causes are sometimes termed sympathetic or eccentric epilepsy; these are but rarely epileptic in the strictest sense of the word, but rather epileptiform.

Epilepsy is occasionally feigned for the purpose of extortion, but an experienced medical practitioner will rarely be deceived; and when it is stated that although many of the phenomena of an attack, particularly the convulsive movements, can be readily simulated, yet that the condition of the pupils, which are dilated during the fit, cannot be feigned, and that the impostor seldom bites his tongue or injures himself, deception is not likely to succeed even with non-medical persons of intelligence.

The medical treatment of epilepsy can only be briefly alluded to here. During the fit little can be done beyond preventing as far as possible the patient from injuring himself while unconsciousness continues. Tight clothing should be loosened, and a cork or pad inserted between the teeth. When the fit is of long continuance, the dashing of cold water on the face and chest, or the inhalation of chloroform, or of nitrite of amyl, may be useful; in general, however, the fit terminates independently of any such measures. When the fit is over the patient should be allowed to sleep, and have the head and shoulders well raised.

In the intervals of the attack, the general health of the patient is one of the most important points to be attended to. The strictest hygienic and dietetic rules should be observed, and all such causes as have been referred to as favouring the development of the disease should, as far as possible, be avoided. In the case of children, parents must be made to realize that epilepsy is a chronic disease, and that therefore the seizures must not be allowed to interfere unnecessarily with the child's training. The patient must be treated as such only during the attack; between times, though being carefully watched, must be made to follow a child's normal pursuits, and no distinction must be made from other children. The same applies to adults: it is far better for them to have some definite occupation, preferably one that keeps them in the open air. If such patients become irritable, then they should be placed under supervision. As regards those who cannot be looked after at home, colonies on a self-supporting basis have been tried, and where the supervision has been intelligent the success has been proved, a fairly high level of health and happiness being attained.

The various bromides are the only medical drugs that have produced any beneficial results. They require to be given in large doses which are carefully regulated for every individual patient, as the quantities required vary enormously. Children take far larger doses in proportion than adults. They are best given in a very diluted form, and after meals, to diminish the chances of gastric disturbance. Belladonna seems also to have some influence on the disease, and forms a useful addition; arsenic should also be prescribed at times, both as a tonic, and for the sake of the improvement it affects in those patients who develop a tendency to acne, which is one of the troublesome results of bromism. The administration of the bromides should be maintained until three years after the cessation of the fits. The occurrence of gastric pain, palpitations and loss of the palate reflex are indications to stop, or to decrease the quantity of the drug. In very severe cases opium may be required.

Surgical treatment for epilepsy is yet in its infancy, and it is too early to judge of its results. This does not apply, however, to cases of Jacksonian epilepsy, where a very large number have been operated on with marked benefit. Here the lesion of the brain is, in a very large percentage of the patients, caused by pressure from outside, from the presence of a tumour or a depressed fracture; the removal of the one, or the elevation of the other is the obvious procedure, and it is usually followed by the complete disappearance of the seizures.

**EPILOGUE**

The appendix or supplement to a literary work, and in particular to a drama in verse, is called an *epilogue*, from ἐπίλογος, the name given by the Greeks to the peroration of a speech. As we read in Shakespeare's *A Midsummer Night's Dream*, the epilogue was generally treated as the apology for a play; it was a final appeal made to encourage the good-nature of the audiences, and to deprecate attack. The epilogue should form no part of the work to which it is attached, but should be independent of it; it should be treated as a sort of commentary. Sometimes it adds further information with regard to what has been left imperfectly concluded in the work itself. For instance, in the case of a play, the epilogue will occasionally tell us what became of the characters after the action closed; but this is irregular and unusual, and the epilogue is usually no more than a graceful way of dismissing the audience. Among the ancients the form was not cultivated, further than that the leader of the chorus or the last speaker advanced and said "Vos valetes, et plaudite, cives"—"Good-by, citizens, and we hope you are pleased." Sometimes this formula was reduced to the one word, "Plaudite!" The word *epilogue* is almost entirely confined to England, and it does not occur in the earliest English plays. It is rare in Shakespeare, but Ben Jonson made it a particular feature of his drama, and may almost be said to have invented the tradition of its regular use. He employed the epilogue for two purposes, either to assert the merit of the play or to depreciate censure of its defects. In the former case, as in *Cynthia's Revels* (1600), the actor went off, and immediately came on again saying:—

"Gentles, be't known to you, since I went in / I am turned and sent, and do thus call you. / The author (jealous how your sense doth take / His travails) hath enjoined me to make / Some short and ceremonious epilogue,"—

and then explained to the audience what an extremely interesting play it had been. In the second case, when the author was less confident, his epilogue was but a forepoem, as in the comedy of *Volpone* (1605), where the actor said:—

"The seasoning of a play is the applause. / Now, as the Fox be punished by the law, / He yet doth hope, there is no suffering due / For any fact which he hath done or done. / If there be, censure him; here he doubtfull stands: / If not, fare jovially and clap your hands."—

Beaumont and Fletcher used the epilogue sparingly, but after
their day it came more and more into vogue, and the form was almost invariably that which Ben Jonson had brought into fashion, namely, the short complete piece in heroic couplets. The protecting play. They dealt with fashion, with politics, or from 1660 to the decline of the drama in the reign of Queen Anne scarcely a play, serious or comic, was produced on the London stage without a prologue and an epilogue. These were always in verse, even if the play itself was in the roughest prose, and they were intended to impart a certain literary finish to the piece. These Restoration epilogues were often very elaborate essays or satires, and were by no means confined to the subject of the preceding play. They dealt with fashion, with politics, or criticism. The prologues and epilogues of Dryden are often brilliantly finished exercises in literary polemic. It became the custom for playwrights to ask their friends to write these poems for them, and the publishers would even come to a prominent poet and ask him to supply one for a fee. It gives us an idea of the seriousness with which the epilogue was treated that Dryden originally published his valuable "Defence of the Epilogue; or An Essay on the Dramatic Poetry of the Last Age" (1672) as a defence of the epilogue which he had written for The Conquest of Granada. In France the custom of reciting dramatic epilogues has never prevailed. French criticism gives the name to such adieux to the public, at the close of a non-dramatic work, as are reserved by La Fontaine for certain critical points in the "Fables." 

EPMENIDES, poet and prophet of Crete, lived in the 6th century B.C. Tradition has it that first instance of commerce, a board of trade arbitrators, a chamber of commerce, training-colleges, a communal college and industrial school, and exchange and a branch of the Bank of France. The town, which is important as the centre of a cotton-spinning region, carries on cotton-spinning, weaving and printing, brewing and distilling, and the manufacture of machinery and iron goods, glue, embroidery, hats, wallpaper and tapioca. An industry peculiar to Épinal is the production of cheap images, lithographs and engravings. There is also trade in wine, grain, live-stock and starch products made in the vicinity. Épinal is an important junction on the Eastern railway.

Épinal originated towards the end of the 10th century with the founding of a monastery by Theodoric (Dietrich) I, bishop of Metz, whose successors ruled the town till 1444, when its inhabitants placed themselves under the protection of King Charles VII. In 1466 it was transferred to the duchy of Lorraine, and in 1790 it was incorporated with the duchy, incorporated with France. It was occupied by the Germans on the 12th of October 1870 after a short fight, and until the 15th was the headquarters of General von Werder.

ÉPINOIS (Gr. ἐπῑος, after, and ναός, a temple), in architecture, the open vestibule behind the nave. The term is not found in any classic author, but is a modern coinage, originating in Germany, to differentiate the feature from opisthodomos, which in the Parthenon was an enclosed chamber.

ÉPINAY, LOUISE FLORENCE PÉTRONILLE TARDIEU D'ESCLAVELLES D' (1726-1783), French writer, was born at Valenciennes on the 11th of March 1726. She is well known on account of her liaisons with Rousseau and Baron von Grimm, and her acquaintanceship with Diderot, D'Alembert, D'Holbach and other French men of letters. Her father, Tardieu d'Esclavelles, a brigadier of infantry, was killed in battle when she was nineteen; and she married her cousin Denis Joseph de La Live d'Épinal, who was made a collector-general of taxes. The marriage was an unhappy one; and Louise d'Épinal believed that the prodigality, dissipation and infidelities of her husband justified her in obtaining a formal separation in 1749. She settled in the château of La Chevrerie in the valley of Montmorency, and there received a number of distinguished visitors. Conceiving a strong attachment for J. J. Rousseau, she furnished for him in 1756 in the valley of Montmorency a cottage which she named "Hermès," and in this retreat he found for a time the quiet and natural rural pleasures he praised so highly. Rousseau, in his Confessions, affirmed that
the inclination was all on her side; but as, after her visit to Geneva, Rousseau became her bitter enemy, little weight can be given to his statements on this point. Her intimacy with Grimm, which began in 1755, marks a turning-point in her life, for under his influence she escaped from the somewhat compromising conditions of her life at La Chevrerie. In 1757-1759 she paid a long visit to Geneva, where she was a constant guest of Voltaire. In Grimm's absence from France (1775-1778), Madame d'Épinay continued for a time as superintender of Diderot's correspondence he had begun with various European sovereigns. She spent most of her later life at La Briche, a small house near La Chevrerie, in the society of Grimm and of a small circle of men of letters. She died on the 17th of April 1783. Her Conversations d'Émilie (1774), composed for the education of her grand-daughter, Émilie de Behunse, was crowned by the French Academy in 1785. The Mémoires et Correspondance de Mme d'Épinay, renfermant un grand nombre de lettres indièes de Grimm, de Diderot, et de J.-J. Rousseau, ainsi que des dixaux, &c., was published at Paris (1818) from a MS. which she had bequeathed to Grimm. The Mémoires are written by her in the form of a sort of autobiographic romance. Madame d'Épinay figures in it as Madame de Montbrillant, and René is generally recognized as Rousseau, Volx as Grimm, Garnier as Diderot. All the letters and documents published along with the Mémoires are generally accepted as genuine. Madame d'Épinay mentions some letters sent to her in the Correspondance de l'abbé Galiani (1818). Two anonymous works, Lettres à mon fils (Geneva, 1758) and Mes moments heureux (Geneva, 1759), are also by Madame d'Épinay.

See Rousseau's Confessions; Lucien Perey [Mlle Herpin] and Gaston Muyras, La Jeunesse de Mme d'Épinay, les dernières années de Mme d'Épinay (1890-1892); Sarrut, Les Éditeurs et les éditeurs, vol. IV; Edmond Scherer, Étude sur la littérature contemporaine, vols. iii. and vii. There are editions of the Mémoires by L. Énaud (1855) and by P. Boiteau (1865); and an English translation, with introduction and notes (1837), by J. H. Frevert.

**EPHINUIUS, SAINT** (c. 315-402), a celebrated Church Father, born in the beginning of the 4th century at Bezanada, a village of Palestine, near Eleutheropolis. He is said to have been of Jewish extraction. In his youth he resided in Egypt, where he began an ascetic course of life, and, freeing himself from Gnostic influences, invoked episcopal assistance against heretical thinkers, eighty of whom were driven from the cities. On his return to Palestine he was ordained presbyter by the bishop of Eleutheropolis, and became the president of a monastery which he founded near his native place. The account of his intimacy with the patriarch Hilarion is not trustworthy. In 367 he was nominated bishop of Constantinia, previously known as Salamis, the metropolis of Cyprus—an office which he held till his death in 402. Zealous for the truth, but passionate and bigoted, he devoted himself to two great labours, namely, the spread of the recently established monasticism, and the confusion of heresy, of which he regarded Origen and his followers as the chief representatives. The first of the Origenists that he attacked was John, bishop of Jerusalem, whom he denounced from his own pulpit at Jerusalem (394) in terms so violent that the bishop sent his archdeacon to request him to desist; and afterwards, instigated by Theophilus, bishop of Alexandria, he proceeded so far as to summon a council of Cyprian bishops to condemn the errors of Origen. In his closing years he came into conflict with Chrysostom, the patriarch of Constantinople, who had given temporary asylum to some Dionysian monks whom Theophilus had expelled on the charge of Origenism. The monks gained the support of the empress Eudoxia, and when she summoned Theophilus to Constantinople that prelate forced the aged Epiphanius to go with him. He had some controversy with Chrysostom but did not stay to see the result of Theophilus's machinations, and died on his way home. The principal work of Epiphanius is the Panarion, or treatise on heresies, of which he also wrote an abridgment. It is a "medicine chest" of remedies for all kinds of heretical belief, of which he names eighty varieties. His accounts of the earlier errors (where he has preserved for us large excerpts from the original Greek of Irenæus) are more reliable than those of contemporary heresies. In his desire to see the Church safely moored he also wrote the

Aeneratus, or discourse on the true faith. His encyclopaedic learning shows itself in a treatise on Jewish weights and measures, and another (incomplete) on ancient gems. These, with two epistles to John of Jerusalem and Jerome, are his only genuine remains. He wrote a large number of works which are lost. In allusion to his knowledge of Hebrew, Syriac, Egyptian, Greek and Latin, Jerome styles Epiphanius Παρθένος (Five-tongued); but if his knowledge of languages was really so extensive, it is certain that he was utterly destitute of critical and logical power. His early asceticism seems to have imbued him with a love of the marvellous; and his religious zeal served only to increase his credulity. His erudition is outweighed by his prejudice, and his inability to recognize the responsibilities of authorship makes it necessary to assign most value to those portions of his works which he simply cites from earlier writers.

The primary sources for the life are the church histories of Socrates and Sozomen, Palladius's De vita Chrysostomi and Jerome's De vir. illustr. t. Petavius (Petauuis) published an edition of the works in 2 vols. fol. at Paris in 1622; cf. Gneis, Piastr. Graec. 41-43. The Panarion and other works were edited by F. Oehler (Berlin, 1856-1861). For more recent work especially on the fragments see K. Bonwetsch's art. in Herzog-Hauck's Realencyc. v. 417. See alsoO. Theologians of the name of a monastery in Epiphanius Scholasticus, friend and helper of Cassiodorus; (2) Epiphanius, bishop of Ticinum (Pavia), c. 438-496; (3) Epiphanius, bishop of the Cyzic and Metropolis of the Caucasus, a.d. 560, to whom some critics have ascribed certain of the works of the 6th century; (4) Epiphanius, bishop of Constantin in the 9th century, to whom a similar attribution has been made.

**EPHINUIUS, FEAST OF.** The word epiphany, in Greek, signifies an apparition of a divine being. It was used as a singular or a plural, both in its Greek and Latin forms, according as one epiphany was contemplated or several united in a single commemoration. For in the East from an early time were associated with the feast of the Baptism of Christ commemorations of the physical birth, of the Star of the Magi, and of the miracles of Cana, and of the feeding of the five thousand. The commemoration of the Baptism was also called by the Greek fathers of the 4th century the Theophany or Theophanies, and the Day of Lights, i.e. of the Illumination of Jesus or of the Light which shone in the Jordan. In the Teutonic west it has become the Festival of the three kings (i.e. the Magi), or simply Twelfth day. Leo the Great called it the Feast of the Declaration; Full-gentius, of the Manifestation; others, of the Apportionment of Christ. In the following article it is attempted to ascertain the date of institution of the Epiphany feast, its origin, and its signifi-

cance and development.

Clément of Alexandria first mentions it. Writing c. 194 he states that the Basilians feasted the day of the Baptism, devoting the whole night which preceded it to lections of the scriptures. They fixed it in the 13th year of Tiberius, on the 15th or 21st of the month Tobi, dates of the Egyptian fixed calendar equivalent to January 19th and 6th. When Clement wrote the great church had not adopted the feast, but toward a.d. 300 it was widely in vogue. Thus the Acts of Philip the Martyr, bishop of Heraclea in Thrace, a.d. 304, mention the "holy day of the Epiphany." Note the singular. Origen seems not to have heard of it as a feast of the Catholic church, but Hippolytus (died c. 232) recognized it in a homily which may be genuine.

Constitution of the Nicene Council, a.d. 325, the primate of Alexandria was charged at every Epiphany Feast to announce to the churches in a "Festal Letter" the date of the forthcoming Easter. Several such letters written by Athanasius and others remain. In the churches so addressed the feast of Jan. 6 must have been already current.

In Jerusalem, according to the Epistle of Macarius to the Armenians, c. 350, the feast was kept with zeal and splendour, and was with Easter and Pentecost a favourite season for Baptism.

We have evidence of the 4th century from Spain that a long fast marked the season of Advent, and prepared for the feast of Epiphany on the 6th of January. The council of

1 For its text see The Key of Truth, translated by F. C. Conybeare, Oxford, and the article ARMENIAN CHURCH.
abolished the Epiphany feast and substituted a Birth feast. This was between 370 and 390.

In 385 Pope Siricius 4 calls January 6 Natalkia, "the Birthday of Christ or of Apparition," and protests against the Spanish custom (at Tarragona) of baptizing on that day—another proof that in Spain in the 4th century it commemorated the Baptism.

In Gaul at Vienna in 360 Julian the Apostate, out of deference to Christian feeling, not to forbade church "on the festival which they keep in January and call Epiphania." So Ammianus; but Zonaras in his Greek account of the event calls it the day of the Saviour's Birth.

Why the feast of the Baptism was called the feast or day of the Saviour's Birth, and why fathers of that age when they call Christmas the birthday constantly qualify and add the words "in the flesh," we are able to divine from Pope Leo's (c. 447) 18th Epistle to the bishops of Sicily. For here we learn that in Sicily they held that in His Baptism the Saviour was reborn through the Holy Spirit. "The Lord," protests Leo, "needed no remission of sins, no remedy of rebirth." The Sicilians also baptized neophytes on January 6, "because baptism conveyed to Jesus and to them one and the same grace." Not so, argues Leo, the Lord sanctioned and hallowed the power of regeneration, not when He was baptized, but when the blood of redemption and the water of baptism flowed forth from his side." Neophytes should therefore be baptized at Easter and Pentecost alone, never at Epiphany.

Fortune has preserved to us among the Spuria of several Latin fathers, Ambrose, Augustine, Jerome and Maximus of Turin, various homilies for Sundays of the Advent fast and for Epiphany. The Advent lections of these homilists were much the same as those of the Spanish Liber comitum; and they insist on Advent being kept as a strict fast, without marriage celebrations.

Their Epiphany action is however Matt. iii. 17, which must therefore have once on a time been assigned in the Liber comitum also in harmony with its general scheme. The psalms used on the day are, cxviii. (cxvii.) "When Israel went forth," cxviii. (xxxi.) "Give unto the Lord," and xxii. (xxiii.) "the Lord is my Shepherd." The same lection of Matthew and also Ps. xxiii. are noted for Epiphany in the Greek oration for the day ascribed to Hippolytus, which is at least earlier than 300, and also in special old Epiphany rites for the Benediction of the waters found in Latin, Greek, Armenian, Coptic, Syriac, &c.

Now by these homilists as by Chrysostom, the Epiphany is regarded as the occasion on which "the Saviour first appeared after the flesh in the world or on earth." These words were classical to the homilists, who explain them as best they can. The baptism is also declared to have been "the consecration of Christ," and "regeneration of Christ and a strengthening of our baptism," and "the second birth of the first birth." It is not the birth hath more renown than his first . . . for now the God of majesty is inscribed (as his father), but then (at his first birth) Joseph the Carpenter was assumed to be his father . . . he hath more honour who cries aloud from Heaven (viz. God the Father), than he who labours upon earth" (viz. Joseph).

Similarly the old ordo Romanus of the age of Pepin (given by Montaillou in his preface to the Mozarabic missal in Migne, Pat. Latina, 85. col. 46), under the rubric of the Vigil of the Theophany, insists that "the second birth of Christ (in Baptism) is being distinguished by so many mysteries (e.g. the miracle of Cana) is more honoured than the first" (birth from Mary).

These homilies mostly belong to an age (?300-400) when the commemoration of the physical Birth had not yet found its own day (Dec. 25), and was therefore added alongside of the Baptism on January 6. Thus the two Births, the physical and the

1 These are Matt. iii. 1-11, xi. 2-15, xii. 1-9; Mark i. 1-8; Luke iii. 1-18. The Pauline letters regard the Epiphany of the Second Advent, of the prophetic or Messianic kingdom.

2 Translated in Ritualis Armenorum (Oxford, 1905).

3 Epist. ad Hierim. c. 2.

4 Hom. I. in Pentec. 0p. tom. ii. 458: 'With us the Epiphany is the first festival. What is this festival's significance? This, that Israel been upon earth was chosen. For this idea there had soon to be substituted that of the manifestation of Christ to the Gentiles.'

spiritual, of Jesus were celebrated on one and the same day, and one homily contains the words: "Not yet is the feast of his origin fully completed, and already we have to celebrate the solemn commemoration of his Baptism. He has hardly been born humanly, and already he is being reborn in sacramental wisdom through the waters of the Baptism, the recreation and renewal of him who was already dead. He was burred (or consecrated) in Jordan. So the Lord arranged as to link rite with rite; I mean, in such wise as to be brought forth through the Virgin and to be begotten through the mystery (i.e. sacrament) in one and the same season." Another homily preserved in a MS. of the 7th or 8th century and assigned to Maximus of Turin declares that the Epiphany was known as the Birthday of Jesus, either because he was then born of the Virgin or reborn in baptism. This also was the classical defence made by Armenian fathers of their custom of keeping the feast of the Birth and Baptism together on January 6. They argued from Luke's gospel that the Annunciation took place on April 6, and therefore the Birth on January 6. The Baptism was on Christ's thirtieth birthday, and should therefore be also kept on January 6. Cosmas Indicopleustes (c. 530) relates that on the same grounds believers of Jerusalem joined the feasts. All such reasoning was of course applicable to the other days of the Armenian calendar, at least three disreputant dates for the Annunciation—January 5, January 9, April 6: and of these January 5 and 9 were older than April 6, which they perhaps borrowed from Epiphanius's commentary on the Gospels. The old Latin homilist, above quoted, hits the mark when he declares that the innate logic of things required the Baptism (which must, he says, be any bow called a natál or birth festival) to fall on the same day as Christmas—Ratio enim exigita. Of the argument from the 6th of April as the date of the Annunciation he knows nothing. The 17th century Armenian Patriarch Neneris, like this homilist, merely rests his case against the Greeks, who incessantly reproached the Armenians for ignoring their Christmas on December 25, on the inherent logic of things, as follows: "Just as he was born after the flesh from the holy virgin, so he was born through baptism and from the Jordan, by way of example unto us. And since there are here two births, albeit differing one from the other in mystic import and in point of time, therefore it was appointed that we should feast them together, as the first, so also the second birth." The Epiphany feast had therefore in its own right acquired the name of natalis dies or birthday, as commemorating the spiritual rebirth of Jesus in Jordan, before the natalis in carnis, the Birthday in the flesh, as Jerome and others call it, was associated with it. This idea was condemned as Ebonitism in the 3rd century, yet it influences Christian writers long before and long after Montanism. "We little father, Circiades," says: "When the oatfish (lythris) Jesus Christ the Lord, are born (gignimur) in the water, nor except by abiding in the water are we in a state of salvation." And Hilary, like the Latin homilists cited above, writes of Jesus that "he was born again through baptism, and then became Son of God," adding that the Father cried, when he had gone up out of the water, "My Son art thou, I have this day begotten thee" (Luke iii. 22). "But this," he adds, "was with the begetting of a man who is being reborn; on that occasion too himself was being reborn unto God to be perfect son; as he was son of man, so in baptism, he was constituted son of God as well." The idea frequently meets us in Hilary; it occurs in the Epiphany hymn of the orthodox Greek church, and in the Epiphany hymns and homilies of the Armenians.

A letter is preserved by John of Nice of a bishop of Jerusalem to the Pope in Rome, which attests a temporary union of both feasts on January 6 in the holy places. The faithful, it says, met before dawn at Bethlehem to celebrate the Birth from the Virgin in the cave; but before their hymns and lections were finished they had to hurry off to Jerusalem, 13 m. the other side of Jerusalem, to celebrate the Baptism, and by consequence neither commemoration could be kept fully and reverently. The writer therefore begs the pope to look in the archives of the Jews brought to Rome after the destruction of Jerusalem, and to ascertain from them the real date of Christ's birth. The pope looked in the works of Josephus and found it to be December 25. The letter's genuineness has been called in question; but revealing as it does the Church's ignorance of the date of the Birth, the inconvenience and precariousness of its association with the Baptism, the recency of its separate institution, it cannot not have been invented. It is too tell-tale a document. Not the least significant fact about it is that it views the Baptism as an established feast which cannot be altered and set on another date. Not it but the physical birth must be removed from January 6 to another date. It has been shown above that perhaps as early as 360 the difficulty was got over in Jerusalem by making the Epiphany wholly and solely a commemoration of the miraculous birth, and suppressing the commemoration of the Baptism. Therefore this letter must have been written—or, if invented, then invented before that date. Chrysostom seems to have known of it, for in his Epiphany homily preached at Antioch, c. 352 (op. vol. ii. 354, ed. Montf.), he refers to the archives at Rome as the source from which the date December 25 could be confirmed, and declares that he had obtained it from those who dwelt there, and who observing it from the beginning and by old tradition, had communicated it to the East. The question of the date of the birth of Jesus was the subject of a very hot discussion among the sect of Basilides? And why the great church adopted the date? Now we know what sort of considerations influenced this sect in fixing other feasts, so we have a clue. They fixed the Birth of Jesus on Pachon 25 (= May 20), the day of the Nilos, or feast of the descent of the Nile from heaven. We should thus expect January 6 to be equally a Nile festival. And this from various sources we know it was. On 'Tobi, says Epiphanius (c. 370), every one draws up water from the river and stores it up, not only in Egypt itself, but in many other countries. In many places, he adds, springs and rivers turn into wine on this day, e.g. at Cibyra in Caria and Gerasa in Arabia. Aristides Rhetoer (c. 160) also relates how in the winter, which began with Tobi, the Nile water was at its purest. Its water, he says, if drawn at the right time conquers time, for it does not go bad, whether you keep it on the spot or export it. Galleries were waiting on a certain night to take it on board and transport it to Italy and elsewhere for libations and irrigations in the Temples of Isis. "Such water," he adds, 'remained fresh, long after other water-supplies had gone bad. The Egyptians filled their pitchers with this water, as others did with wine; they stored it in their houses for three or four years or more, and recommended it the more, the older it grew, just as the Greeks did theirs." Two centuries later Chrysostom, as we have seen, commends in identical terms the water blessed and drawn from the rivers at Christmas. It is therefore probable that the Basilidian festival of the Birth of Jesus was a Christianized form of the blessing of the Nile, called by Chabas in his Coptic calendar Hidrosis. Mas'tudd the Arab historian of the 10th century, in his Présirés d'or (French trans. Paris, 1863, ii. 364), enlarges on the splendid divers of this feast as he saw it still celebrated in Egypt.

Epiphanius also (Haer. 51) relates a curious celebration held at Alexandria of the Birth of the Aeon. On January 5 or 6 the votaries met in the holy compound or Temple of the Maiden (Korè), and sang hymns to the music of the flute till dawn, when they went down with torches into a shrine under ground, and fetched up a wooden idol on a bier representing Korè, seated and naked, with crosses marked on her brow, her hands and her knees. Then with flute-playing, hymns and dances they carried the image seven times round the central shrine, before restoring it again to its dwelling-place below. He adds: And the votaries that to-day at this hour Korè, that is, the Virgin, gave birth to the Aeon." Epiphanius says this was a heathen rite, but it rather resembles some Basilidian or Gnostic commemoration of the spiritual birth of the Divine life in Jesus of the Christhood, from the older creation the Ecclesia.

The earliest extant Greek text of the Epiphany rite is in a

1 Perhaps Epiphanius is here, after his wont, transcribing an earlier source.
EPIRUS

Euchologion of about the year 795, now in the Vatican. The prayers recite that at His baptism Christ hallowed the waters by His Holy Spirit, and that only by being visited by the Holy Spirit were the streams of Jordan blessed. So they will be able to purify soul and body of all who draw up and partake of them. The hymn sung contains such clauses as these:

"To-day the grace of the Holy Spirit hallowing the waters appears (τραβηγματα, cf. Epiphany). To-day the system of waters spread out their branches under the Lord's feet, inasmuch as the unseen, is that he may reveal himself to us. To-day the Increte is of his own will ordained (ότι hath hands laid on him) by him. To-day the Unleashing bends his neck to the Lord's servant, in order to free us from servitude. To-day we were liberated from darkness and are illumined by light of divine knowledge. To-day for us the Lord by means of rebirth (ότι palingeneses) of the Image reshapes the Archetype."

This last clause is obscure. In the Armenian hymns the idea of the rebirth not only of believers, but of Jesus, and of the latter's ordination by John, are very prominent.

The history of the Epiphany feast may be summed up thus:

From the Jews the Church took over the feasts of Pascha and Pentecost; and Sunday was a weekly commemoration of the Resurrection. It was inevitable, however, that believers should before long desire to commemorate the Baptism, with which the oldest form of evangelical tradition began, and which was widely regarded as the occasion when the divine life began in Jesus; when the Logos or Holy Spirit appeared and rested on Him, conferring upon Him spiritual unction as the promised Messiah; when, according to an old reading of Luke ili. 22, He was begotten of God. Perhaps the Ebionite Christians of Palestine first instituted the feast, and this, if a fact, must underlie the statement of John of Nice, a late but well-informed writer (c. 950), that it was fixed by the disciples of John the Baptist who were present at Jesus' Baptism. The Egyptian gnostics anyhow had the feast and set it on January 6, a day of the blessing of the Nile. It was a feast of Adoptionist complexion, as one of its names, viz. the Birthday (Greek γεννηθα, Latin Natalicia or Natalis dies), implies. This explains why in east and west the feast of the physical birth was for a time associated with it; and to justify this association it was suggested that Jesus was baptized just on His thirtieth birthday. In Jerusalem and Syria it was perhaps the Ebionite or Adoptionist, we may add also the Gnostic, associations of the Baptism that caused this aspect of Epiphany to be relegated to the background, so that it became wholly a feast of the miraculous birth. At the same time other epiphanies of Christ were superadded, e.g. of Cana, where Christ began His miracles by turning water into wine and manifesting his glory, and of Magdala, etc. of the Magdalen. Hence it is often called the Feast of Epiphanyes (in the plural). In the West the day is commonly called the Feast of the three kings, and its early significance as a commemoration of the Baptism and season of blessing the waters has been obscured; the Eastern churches, however, of Greece, Russia, Georgia, Armenia, Egypt, Syria have been more conservative. In the far East it is still the season of seasons for baptisms, and in Armenia children born long before are baptized at it. Long ago it was a baptismal feast in Sicily, Spain, Italy (see Pope Galterius to the Lucanian Bishops), Africa and Ireland. In the Manx prayer-book of Bishop Phillips of the year 1610 Epiphany is called the "little Nativity" (La nolicky bigge), and the Sunday which comes between December 25 and January 6 is "the Sunday between the two Nativities," or Ith dimi oedyr a Nicolaich; Epiphany itself is the "feast of the water vessel," laith ymmyri wyseky, or "of the well of water," Chibbyri wiskey.

4 The same idea is frequent in Epiphany homilies of Chrysostom and other 4th-century fathers.

EPIRUS, or EPIRHUS, an ancient district of Northern Greece extending along the Euxine Sea from the Acrocorinian promontory on the N. to the Ambracian gulf on the S. It was conterminous on the landward side with Illyria, Macedonia and Thessaly, and thus corresponds to the southern portion of Albania (q.v.). The name Epirus (Ἐπιρος) signified "mainland," and was originally applied to the whole coast southward to the Corinthian Gulf, in contradistinction to the neighbouring islands, Corcyra, Leucas, &c. The country is all mountainous, especially towards the east, where the great rivers of north-western Greece—Peneius, Achelous, Arachthos, Areus, Larisus, and Nysus—rise in a Lacea-like basin at the foot of the backbone of the Pindus chain. In ancient times Epirus did not produce corn sufficient for the wants of its inhabitants; but it was celebrated, as it has been almost to the present day, for its cattle and its horses. According to Theopompus (4th cent. B.C.), the Epirots were divided into fourteen independent tribes, of which the principal were the Chaones, the Thesproti and the Molossi. The Chaones (perhaps akin to the Chonoi who dwelt in the heel of Italy) inhabited the Acrocorinian shore, the Molossians the inland districts round the lake of Pamvotis (mod. Jannina), and the Thesprotians the region to the north of the Ambracian gulf. In spite of its distance from the chief centres of Greek thought and action, and the barbarian repute of its inhabitants, Epirus was believed to have exerted at an early period no small influence on Greece, by means of more especially of the oracle of Dodona. Aristotle even placed in Epirus the original home of the Hellenes. But in historic times its part in history is mainly marked by the fact that it was the first of the Greek states to be colonised; a number of colonies on its coast, which formed stepping-stones towards the Adriatic and the West. Of these one of the earliest and most flourishing was the Corinthian colony of Ambraia, which gives its name to the neighbouring gulf. Elatia, Bucheta and Pandosia, in Thesprotia, originated from Elis. Among the other towns in the country the following were of some importance. In Chaonia: Falaste and Chimaera, fortified posts to which the dwellers in the open country could retire in time of war; Onchesmus or Anchiasmus, opposite Corcyra (Corfu), now represented by Santi Quarante; Phoenice, still so called, the wealthiest of all the native cities of Epirus, and after the fall of the Molossian kingdom the centre of an Epipotic League; Bathrotum, the modern Butrinto; Phanote, important in the Roman campaigns in Epirus; and Adrianopolis, founded by the emperor whose name it bore. In Thessprotia: Cassope, the chief town of the most powerful of the Thesprotian Epiroths and Ephyra, afterwards Chichera, Cerro, and Leukas, afterwards Chichera, Caryae. Leake with the monastery of St John 3 or 4 m. from Phanari, and C. Bursian with Kastri at the northern end of the Achesean lake. In Molossia: Passaron, where the kings were wont to take the oath of the constitution and receive their people's allegiance; and Tecnon, Phylace and Horreum, all of doubtful identification. The Byzantine town of Rogn is probably the same as the modern Luro, the Greek Oropus.

History.—The kings, or rather chieftains, of the Molossians, who ultimately extended their power over all Epirus, claimed to be descended from Pyrrhus, son of Achilles, who, according to legend, settled in the country after the sack of Troy, and transmitted his kingdom to Molossus, his son by Andromache. The early history of the dynasty is very obscure; but Admetus, who lived in the 5th century B.C., is remembered for his hospitalitable reception of the banished Themistocles, in spite of the fact that the great Athenian had persuaded his countrymen to refuse the alliance tardily offered by the Molossians when victory against the Persians was already secured. Admetus was succeeded, about 420 B.C., by his son or grandson, Tharymbas or Arymbas I., who being placed by a decree of the people under the guardianship of Sablynthus, chief of the Attinates, was educated at Athens, and at a later date introduced a higher civilization among his subjects. Alcetas, the next king mentioned in history, was restored to his throne by Dionysius of Syracuse about 366-352 B.C. His son and successor, Arymbas II., (who succeeded by the death of his brother Neoptolemus) ruled with prudence and equity, and gave encouragement to literature and the arts.
EPISCOPACY

To him Xenocrates of Chalcodon dedicated his four books on the art of governing; and it is specially mentioned that he bestowed great care on the education of his brother's children. One of them, Troas, he married; Olympia, the other niece, was married to Philip II. of Macedon and became the mother of Alexander, and the brother of Amyntas, the brother of Olympia, was put on the throne by Philip and married his daughter Cleopatra. Alexander assumed the new title of king of Epirus, and raised the reputation of his country abroad. Asked by the Tarantine for aid against the Samnites and Lucanians, he made a descent as Paestum in 332 B.C., and reduced several cities of the Lucani and Bruttii; but in a second attack he was surrounded, defeated and slain near Pandosia in Bruttium.

Arcadius, the son of Amyntas II., succeeded Alexander. He espoused the cause of Olympia against Cassander, but was dethroned by his own soldiers, and had hardly regained his position when he fell in battle (313 B.C.) against Philip, brother of Cassander. He had, by his wife Pithia, a son, the celebrated Pyrrhus, and two daughters, Deidamia and Troas, of whom the former married Demetrius Poliorcetes. His brother Alecetas, who succeeded him, continued unsuccessfully the war with Carthage as king. He was put to death by his rebellious subjects in 205 B.C., and was succeeded by Pyrrhus (q.v.), who for six years fought against the Romans in south Italy and Sicily, and gave to Epirus a momentary importance which it never again possessed. Alexander, his son, who succeeded in 272 B.C., attempted to seize Macedonia, and defeated Antigonus Gonatas, but was himself shortly afterwards driven from his kingdom by Demetrius. He recovered it, however, and spent the rest of his days in peace. Two other insignificant reigns brought the family of Pyrrhus to its close, and Epirus was thenceforward governed by a magistrature, elected annually in a general assembly of the nation held at Passaron. Having imprudently espoused the cause of Perseus (q.v.) in his ill-fated war against the Romans, 168 B.C., it was exposed to the fury of the conquerors, who destroyed, it is said, seventy towns, and carried into slavery 150,000 of the inhabitants. From this blow it never recovered. At the dissolution of the Achaean League (q.v.), 146 B.C., it became part of the province of Macedonia, receiving the name Epirus Vetus, to distinguish it from Epirus Nova, which lay to the east.

On the division of the empire it fell to the East, and so remained until the taking of Constantinople by the Latins in 1204, when Michael Angelus Comnenus seized Aeololia and Epirus. On the death of Michael in 1216, these countries fell into the hands of his brother Theodore. Thomas, the last of the direct line, was murdered in 1329 by his nephew, Thomas, lord of 22 Castles, and his dominions were dismembered. Not long after, Epirus was overrun by the Samians and Albanians, and the confusion which had been growing since the division of the empire was worse confounded still. Charles II. Tocco, lord of Cephalonia and Zante, obtained the recognition of his title of Despot of Epirus from the emperor Manuel Comnenus in the beginning of the 15th century; but his kingdom was deprived of their possession in 1433 by Murad (Amurat) II. In 1445, Scanderbeg, king of Albania, made himself master of a considerable part of Epirus; but on his death it fell into the power of the Venetians. From these it passed again to the Turks, under whose dominion it still remains. For modern history see ALBANIA.

EPISCOPACY (from Late Lat. episcopus, the office of a bishop, episcopus), the general term technically applied to that system of church organization in which the chief ecclesiastical authority within a defined district, or diocese, is vested in a bishop. As such it is distinguished on the one hand from Presbyterianism, government by elders, and Congregationalism, in which the individual church or community of worshippers is autonomous, and on the other from Papalism. The origin and development of episcopacy in the Christian Church, and the functions and attributes of bishops in the various churches, are dealt with elsewhere (see CHURCH HISTORY and BISHOP). Under the present heading it is proposed only to discuss briefly the various types of episcopacy actually existing, and the different principles that they represent.

The deepest line of cleavage is naturally between the view that episcopacy is a divinely ordained institution essential to the effective existence of a church as a channel of grace, and the view that it is merely a convenient form of church order, evolved as the result of a variety of historical causes, and not necessary to the proper constitution of a church. The first of these views is closely connected with the doctrine of the Apostolical Succession. According to this, Christ placed his apostles in certain powers of order and jurisdiction in the Church, among others that of transmitting these powers to others through the laying on of hands; and this power, whatever obscurity may surround the practice of the primitive Church (see APOSTLE, AD FIN.), was very early confined to the order of bishops, who by virtue of a special consecration became the successors of the apostles in the function of handing on the powers and graces of the ministry. A valid episcopate, then, is one derived in an unbroken series of "layings on of hands" by bishops from the time of the apostles (see ORDER, HOLY). This is the Catholic view, common to all the ancient Churches whether of the West or East, and it is one that necessarily excludes from the union of Christendom all those Christian communities which possess no such apostolically derived ministry.

Apart altogether, however, from the question of orders, episcopacy represents a very special conception of the Christian Church. In the fully developed episcopal system the bishop sums up in his own person the collective powers of the Church in his diocese, not by delegation of these powers from below, but by divinely bestowed authority from above. "Ecclesia est in episcopo," wrote St Cyprian (Cyp. iv. Ep. 9); the bishop, as the successor of the apostles, is the centre of unity in his diocese, the unity of the Church as a whole is maintained by the intercommunion of the bishops, who for this purpose represent their successors. The bishops, individually and collectively, are thus the essential ties of Catholic unity; they alone, as the depositories of the apostolic traditions, establish the norm of Catholic orthodoxy in the general councils of the Church. This high theory of episcopacy which, if certain of the Ignatian letters be genuine, has a very early origin, has, of course, fallen upon evil days. The power of the collective episcopate to maintain Catholic unity was disputed long before it was overshadowed by the centralized authority of Rome; before the Reformation, its last efforts to assert its supremacy in the Western Church, at the councils of Basel and Constance, had broken down; and the religious revolution of the 16th century left it largely discredited and exposed to a double attack, by the papal monarchy on the one hand and the democratic Presbyterian model on the other. Within the Roman Catholic Church the high doctrine of episcopacy continued to be maintained by the Gallicans and Fenians (see GALICANISM and FENIANISM) as against the claims

1 See Bishop C. Gore, The Church and the Ministry (1887).
of the Papacy, and for a while with success; but a system which had failed to preserve the unity of the Church even when the world was united under the Roman empire could not be expected to do so in a world split up into a series of rival states, of which many had already reorganized their churches on a national basis. "Febroni" indeed, was in favour of recognizing the national basis of ecclesiastical organization, and saw in Episcopacy the best means of uniting the dissenters to the Catholic Church, which was to consist, as it were, of a free federation of episcopal churches under the presidency of the bishop of Rome. The idea had considerable success; for it happened to meet with the views of the secular princes. But religious people could hardly be expected to see in the worldly prince-bishops of the Empire, or the wealthy courtier-prelates of France, the trustees of the apostolical tradition. The Revolution intervened; and when, during the religious reaction that followed, men sought for an ultimate authority, they found it in the papal monarch, exalted now by ultramontane zeal into the sole depository of the apostolical tradition (see ULTRAMONTANISM). At the Vatican Council of 1870 episcopacy made its last stand against papalism, and was vanquished (see VATICAN COUNCIL). The pope still addresses his fellow-bishops as "vates", but from the time the Roman Catholic Church has adopted the fraternal union of coequal authorities, which is of the essence of episcopacy, has vanished; and in its place is set the autocracy of one. The modern Roman Catholic Church is episcopal, for it preserves the bishops, whose potestas ordinis not even the pope can exercise until he has been duly consecrated; but the bishops as such are now but subordinate elements in a system for which "Episcopacy" is certainly no longer an appropriate term.

The word Episcopacy has, in fact, since the Reformation, been more especially associated with those churches which, while ceasing to be in communion with Rome, have preserved the episcopal model. Of these by far the most important is the Church of England, which has preserved its ecclesiastical organization essentially unchanged since its foundation by St Augustine, and its daughter churches (see ENGLAND, CHURCH OF, AND ANGLICAN COMMUNION). The Church of England since the Reformation has been the chief champion of the principle of Episcopacy against the papal pretensions on the one hand and Presbyterianism and Congregationalism on the other. As to the divine origin of Episcopacy and, consequently, of its universal obligation in the Christian Church, Anglican opinion has been, and still is, considerably divided. The "High Church" view, now predominant, is practically identical with that of the Gallicans and Febronians, and is based on Catholic practice in those ages of the Church to which, as well as to the Bible, the formularies of the Church of England make appeal. In this view, however, is the outcome of the general Catholic movement of the 16th century, it can hardly be taken as typical of Anglican tradition in this matter. Certainly, in the 16th and 17th centuries, the Church of England, while rigorously enforcing the episcopal model at home, and even endeavouring to extend it to Presbyterian Scotland, did not regard foreign non-episcopal Churches otherwise than as sister communions. The whole issue had, in fact, become confused with the confusion of functions of the two systems. In the view of the Church of England the ultimate governance of the Christian community, in things spiritual and temporal, was vested not in the clergy but in the "Christian prince" as the vicegerent of God. It was the

1 Neither the Articles nor the authoritative Homilies of the Church of England speak of episcopacy as essential to the constitution of a church. The latter make the three notes or marks by which a true church is known "pure and sound doctrine, the sacraments administered according to Christ's holy institution, and the right use of ecclesiastical discipline". These marks are perhaps ambiguous, but they certainly do not depend on the possession of the Apostolic Succession; for it is further stated that "the bishops of Rome and their adherents are not the true Church of Christ" (Homily "concerning Prelates", ed. Oxford, 1852, p. 292).

2 "He and his holy apostles likewise, namely Peter and Paul, did forbid unto all Ecclesiastical Ministers, dominion over the Church of Christ" (Homilies appointed to be read in Churches, "The V. part transference to the territorial sovereigns of modern Europe of the theocratic character of the Christian heads of the Roman world-empire; with the result that for the reformed Churches the unit of church organization was no longer the diocese, or the group of dioceses, but the Christian state. Thus in England the bishops were, while retaining their episcopal character, themselves the vicars of the apostles; and when they died their conscesion as successors of the apostles, came to be regarded not as representing their dioceses in the state, but the state in their dioceses. Forced on their dioceses by the royal Congé d'élire (q.v.), and enthusiastic apostles of the High Church doctrine of non-resistance, the bishops were looked upon as no more than lieutenants of the crown; and Episcopacy was ultimately resisted by Presbyterians and Independents as an expression and instrument of arbitrary government, "Presbytery" being confounded with "Popery" in a common condemnation.

With the constitutional changes of the 18th and 19th centuries, however, a corresponding modification took place in the character of the English episcopate; and a still further change resulted from the multiplication of colonial and missionary sees having no connexion with the state (see ANGLICAN COMMUNION). The consciousness of being in the line of apostolic succession helped the English clergy to revert to the principle Ecclesia est in episcopo, and the great period of colonial expansion in parts of the world have something of the character, though they do not claim the eccumenical authority, of the general councils of the early Church (see LAMBETH CONFERENCES).

Of the reformed Churches of the continent of Europe only the Lutheran Churches of Denmark, Iceland, Norway, Sweden and Finland preserve the episcopal system in anything of its historical sense; and of these only the last two last can lay claim to the possession of bishops in the unbroken line of episcopal succession. The superintendents (variously entitled also archbishops, deans, provosts, bishops) of the Evangelical (Lutheran) Church, as established in the several states of Germany and in Austria, are not bishops in any canonical sense, though their jurisdictions are known as dioceses and they exercise many episcopal functions. They have no special powers of order, being presbyters, and their legal status is admittedly merely that of officials of the territorial sovereign in his capacity as head of the territorial church (see SUPERINTENDENT). The "bishops" of the Lutheran Church in Transylvania are equivalent to the superintendents.

Episcopacy in a stricter sense is the system of the Moravian Brethren (q.v.) and the Methodist Episcopal Church of America (see METHODISM). In the case of the former, claim is laid to the unbroken episcopal succession through the Waldenses, and the question of their eventual intercommunion with the Anglican Church of the Mission to the Ruthless Rebellion, "ed. Oxford, 1863, p. 379.

2 Princes are "God's lieutenants, God's ministers, God's commissioners, God's judges, God's vicegerents" ("The II. part of the Sermon of Obedience," ib. p. 64).

Juridically they were, of course, never thus in the strict sense in which the term could be used of the Lutheran superintendents. They were, however, never mere royal officials, but peers of parliament, holding their temporalities as baronies under the crown.

During the crisis of the Reformation all the Swedish sees became vacant but two, and the bishops of these two soon left the kingdom. The episcopate, however, was preserved by Peter Magnusson, who, when residing as warden of the Swedish hospital of St George in Rome, had hoped, in the case of the see of Westerås, and consecrated, c. 1524. No official record of his consecration can be discovered, but there is no sufficient reason to doubt the fact; and it is certain that during his lifetime he was acknowledged as a canonical bishop both by Roman Catholics and by Protestants. In 1528 Magnusson consecrated bishops to fill the vacant sees, and, assisted by one of these, Magnus Sommar, bishop of Södermanland, and a descendant of the line of the bishops of Upsala, by his consecration, c. 1528. No official record of his consecration can be discovered, but there is no sufficient reason to doubt the fact; and it is certain that during his lifetime he was acknowledged as a canonical bishop both by Roman Catholics and by Protestants. In 1528 Magnusson consecrated bishops to fill the vacant sees, and, assisted by one of these, Magnus Sommar, bishop of Södermanland, and a descendant of the line of the bishops of Upsala, by his consecration, c. 1528.
Church was accordingly mooted at the Lambeth Conference of 1908. The bishops of the Methodist Episcopal Church, on the other hand, derive their orders from Thomas Coke, a presbyter of the Church of England, who in 1784 was ordained by John Wesley, assisted by two other presbyters, "superintendent" of the Methodist Society in America. Methodist episcopacy is therefore based on the denial of any special spiritual "ordinis in the degree of bishop, and is fundamentally distinct from that of the Catholic Church—using this term in its narrow sense as applied to the ancient churches of the East and West.

In all of these ancient churches episcopacy is regarded as of divine origin; and in those of them which reject the papal supremacy the bishops are still regarded as the guardians of the tradition of apostolic orthodoxy and the stewards of the gifts of the Holy Ghost to men (see ORTHODOX EASTERN CHURCH; ARABIAN CHURCH; COPTICS: Coptic Church, &c.). In the West, Gallican and Febronian Episcopacy are represented by two ecclesiastical bodies: the Jansenist Church under the archbishop of Utrecht (see JANSENISM and Utrecht), and the Old Catholics (q.v.). Of these the latter, who separated from the Roman communion after the promulgation of the dogma of papal infallibility, represent a pure revolt of the system of Episcopacy against that of Papalism. After the Armenian Church; Copyts: Copic Church, &c. In the West, Gallican and Febronian Episcopacy are represented by two ecclesiastical bodies: the Jansenist Church under the archbishop of Utrecht (see JANSENISM and Utrecht), and the Old Catholics (q.v.). Of these the latter, who separated from the Roman communion after the promulgation of the dogma of papal infallibility, represent a pure revolt of the system of Episcopacy against that of Papalism. After the

**EPISCOPUS—EPITHESE**

was written by Philip Limborch, and one was also prefixed by his successor, Etienne de Courcelles (Curcellaeus) (1586–1659), to an edition of his collected works published in 2 vols. (1652–1665). See also art in Herzog-Hauck, Reussencyclop"dia.

**EPISODE**, an incident occurring in the history of a nation, an institution or an individual, especially with the significance of being an interruption of an ordered course of events, an irrelevance. The word is derived from a word (teno) with a technical meaning in the ancient Greek tragedy. It is defined by Aristotle (Poetics, 12) as μήκος διὸν τραγούδων τὸ μεσᾶρ διὸν χορῶν μελῶν, all the scenes, that is, which fall between the choric songs. Διάδοσιν, or entrance, is generally applied to the entrance of the chorus, but the reference may be to that of the actors at the close of the choric songs. In the early Greek tragedy the parts which were spoken by the actors were considered of subsidiary importance to those sung by the chorus, and it is from this aspect that the meaning of the word, as something which breaks off the course of events, is derived (see A. E. Haigh, The Tragic Drama of the Greeks, 1866, at p. 353).

**EPITAXIS** (Gr. ἐπί, upon, and ἀπέστειλε, to drop), the medical term for bleeding from the nose, whether resulting from local injury or some constitutional condition. In persistent cases of nose-bleeding, various measures are adopted, such as holding the patient by the head, or the application of ice, or of such astringents as zinc or alum, or plugging the nostrils.

**EPISTEMOLOGY** (Gr. ἐπιστήμη, knowledge, and λόγος, theory, account; Germ. Erkenntnistheorie), in philosophy, a term applied, probably first by J. F. Ferrier, to that department of thought whose subject matter is the nature and origin of knowledge. It is thus contrasted with metaphysics, which considers the nature of reality, and with psychology, which deals with the objective part of cognition, and, as Prof. James Ward said, "is essentially genetic in its method." (Mind, April 1883, pp. 166-167). Epistemology is concerned rather with the possibility of knowledge in the abstract (sub specie aeternitatis, Ward, i.e). In the evolution of thought epistemological inquiry succeeded the speculations of the early thinkers, who concerned themselves primarily with attempts to explain existence. The differences of opinion which arose on this problem naturally led to the inquiry as to whether any universally valid statement was possible. The Sophists and the Sceptics, Plato and Aristotle, the Stoics and the Epicureans took up the question, and from the time of Locke and Kant it has been prominent in modern philosophy. It is extremely difficult, if not impossible, to draw a hard and fast line between epistemology and other branches of philosophy. If, for example, philosophy is divided into the theory of knowing and the theory of being, it is impossible entirely to separate the latter (Ontology) from the analysis of knowledge (Epistemology), so close is the connexion between knowledge and the object known. Again, the relation between logic and knowledge is extremely close. Some thinkers have identified the two, while others regard Epistemology as a subdivision of logic; others demarcate their relative spheres by confining logic to the science of the laws of thought, i.e., to formal logic. An attempt has been made by some philosophers to substitute "Gnosiology" (Gr. γνωσή) for "Epistemology" as a special term for that part of Epistemology which is concerned with the systematic treatment of the concepts of knowledge. Besides opposing at all points the peculiar doctrines of Carvinism, Episcopius protested against the tendency of Calvinists to lay so much stress on abstract dogma, and argued that Christianity was practical rather than theoretical—not so much a system of intellectual belief as a moral power—and that an orthodox faith did not necessarily imply the knowledge of and assent to a system of doctrine which included the whole range of Christian truth, but only the knowledge and acceptance of so much of Christian truth as was necessary to effect a real change on the heart and life.

The principal works of Episcopius are his Confessio s. declaratio senentistarum postuorum qui in fomendata Belgio Remonstrantes vocatur (Utrecht, 1633); his Verus theologus remonstrans, and his unfinished work Institutiones theologicae. A life of Episcopius
1. Epistles and Letters.—The student of literary history soon discovers that a broad distinction exists between the letter and the epistle. The letter is essentially a spontaneous, non-literary production, egocentric, intimate, personal and private, a substitute for a spoken conversation. The epistle, on the other hand, rather takes the place of a public speech, it is written with an audience in view, it is a literary form, a distinctly artistic effort aiming at permanence; and it bears much the same relation to a letter as a Platonic dialogue does to a private talk between two friends. The posthumous value placed on a great man's letters would naturally lead to the production of epistles, which was often a pleasant form of literary effort for the modern. If we attempt to set forth the views of a formidable mind, either purely or as forgeries under some eminent name, we find that pseudonymous epistles were especially numerous under the early Roman empire, and mainly attached themselves to the names of Plato, Demosthenes, Aristotile and Cicero.

Both letters and epistles have come down to us in considerable variety and extent from the ancient world. Babylonia and Assyria, Egypt, Greece and Rome alike contribute to our inheritance of letters. Those of Aristotile are of questionable genuineness, but we can rely, at any rate in part, on those of Isocrates and Epiphanus. Some of the letters of Cicero are rather epistles, since they were meant ultimately for the general eye. The papyrus discoveries in Egypt have a peculiar interest, for they are mainly the letters of people unknown to fame, and having no thought of publicity. It is less to be wondered at that we have a large collection of ancient epistles, especially in the realm of magic and religion, for epistles were meant to live, were published in several copies, and were not a difficult form of literary effort. The Tell el-Amarna tablets found in Upper Egypt in 1889 are a series of despatches in cuneiform script from Babylonian kings and Phoenician and Palestinian governors to the Pharaohs (c. 1400 B.C.). The epistles of Dionysius of Halicarnassus, Plutarch, Seneca and the Younger Pliny claim attention at this point. In the later Roman period and into the middle ages, formal epistles were almost a distinct branch of literature. The ten books of Symmachus' Epistolae, so highly esteemed in the cultured circles of the 4th century, may be contrasted with the less elegant but more forceful epistles of Jerome.

The distinction between letters and epistles has particular interest for the student of early Christian literature. G. A. Deissmann (Bible Studies) assigns to the category of letters all the Pauline writings as well as 2 and 3 John. The books bearing the names of James, Peter and Jude, together with the Pastoralis (though these may contain fragments of genuine Pauline letters) and 1, 2, and 3 John, he regards as genuine. For 3 John he calls less a letter than a religious tract. It is doubtful, however, whether we can thus reduce all the letters of the New Testament to one or other of these categories; and W. M. Ramsay (Hastings' Dict. Bib. Extra vol. p. 401) has pointed out with some force that "in the new conditions a new category had been developed—the general letter addressed to a whole class of persons or to the entire Church of Christ." Such writings have affinities with both the letter and the epistle, and they may further be compared with the "edicts and rescripts by which Roman law grew, documents arising out of special circumstances but treating them on general principles." Most of the literature of the sub-apocalyptic age is epistolary, and we have a particularly interesting form of epistle in the communications between churches (as distinct from individuals) known as the First Epistle of Clement (Rome to Corinth), the Martyrology of Polycarp ( Smyrna to Philomelium), and the Letters of the Churches of Asia Minor and Asia Minor, describing the Gallican martyrs of A.D. 177. In the following centuries we have the valuable epistles of Cyprian, of Gregory Nazianzen (to Cledonius on the Apollinarian controversy), of Basil (to be classed rather as letters), of Ambrose, Chrysostom, Augustine and Jerome. The encyclical letters of the Roman Catholic Church are epistles, even more so than bulls, which are usually more special in their destination. In the Renaissance one of the most common forms of literary production was that modelled upon Cicero's letters. From Petrarch to the Epistolae obscurnrum virorum there is a whole epistolary literature. The Epistolae obscurnrum virorum have to some extent a counter-part in the Epistles of Martin Marprelate. Later satires in an epistolary form are Pascal's Promiscul Letters, Swift's Drapier Letters, and the Letters of Junius. The "open letter" of modern journalism is really an epistle.

2. Epistles in Poetry.—A branch of poetry bears the name of the Epistle, and is modelled on those pieces of Horace which are almost essays (sermones) on moral or philosophical subjects, and are chiefly distinguished from other poems by being addressed to particular patrons or friends. The epistle of Horace to his aged friend (villius) is a model of maturing senility, and is at once a masterpiece and a model of what an epistle should be. The epistles of the work in this direction of Ovid, Claudian, Ausonius and other late Latin poets have been preserved, but it is particularly those of Horace which have given this character to the epistles in verse which form so very characteristic a section of French poetry. The graceful precision and dignified familiarity of the epistle are particularly attractive to the temperament of France. Clement Marot, in the 16th century, first made the epistle popular in France, with his brief and spirited specimens. We pass the witty epistles of Scarron and Voltaire, to reach those of Boileau, whose epistles, twelve in number, are the classic examples of this form of verse in French literature; they were composed at different dates between 1668 and 1695. In the 18th century Voltaire enjoyed a supremacy in this graceful and sparkling species of writing; the Épitre à Uranie is perhaps the most famous of his verse-letters. Gresset, Bernis, Sedaine, Dorat, Genil-Bardou, all excelled in the epistle. The "Epistres" of J. P. G. Viennet (1777-1868) were not easy and mundane like their predecessors, but violently polemical. Viennet, a hot defender of lost causes, may be considered the latest of the epistolary poets of France.

In England the verse-epistle was first prominently employed by Samuel Daniel in his "Letter to Octavia to Marcus Antonius" (1599), and later on, more legitimately, in his "Certain Epistles" (1601-1603). His letter in terza rima, to Lucy, Countess of Bristol, is one of the finest examples of this form in English literature. It was Daniel's deliberate intention to introduce the Epistle into English poetry, "after the manner of Horace." He was supported by Ben Jonson, who has some fine Horatian epistles in his Forests (1616) and his Underwoods. Letters to Several Persons of Honour form an important section in the poetry of John Donne. Haddington's Epistle to a Friend is one of his most finished pieces. Henry Vaughan (1622-1695) treated the epistle as a fine epistolary form. The finest in this vein is Gombauld (1670-1666). Such "letters" were not unfrequent down to the Restoration, but they did not create a department of literature such as Daniel had proposed. At the close of the 17th century Dryden greatly excelled in this class of poetry, and his epistles to Congreve (1694) and to the duchess of Ormond (1700) are among the most graceful and eloquent that we possess. During the age of Anne various Augustan poets in whom the lyrical faculty was slight, from Congreve and Richard Duke to Ambrose Phillips and William Somerville, essayed the epistle with more or less success, and it was employed by Gay for several exercises in his elegant persiflage. Among the epistles of Gay, one rises to an eminence of merit, that called "Mr Pope's welcome from Greece," written in 1720. But the great writer of epistles in English is Pope himself, to whom the glory of this kind of verse belongs. His "Eloisa to Abelard" (1717) is carefully modelled on the form of Ovid's "Heroides," while his Moral Essays he adopts the Horatian formula for the epistle. In either case his success was brilliant and complete. The "Epistle to Dr Arbuthnot" has not been surpassed, if it has been equalled, in Latin or French poetry of the same class. But Pope excelled, not only in the voluptuous and in the didactic epistle, but in that of compliment as well, and there is no more graceful example of this in literature than is afforded by the letter about the poems of Parnell addressed, in 1711, to Robert, Earl of Oxford. After the day of Pope the epistle again fell into desuetude, or occasional use, in England. It revived in
the charming naiveté of Cowper's lyrical letters in octosyllabics to his friends, such as William Bull and Lady Austin (1782).

At the close of the century Samuel Rogers endeavoured to resuscitate the neglected form in his "Epistle to a Friend" (1798). The formality and conventional grace of the epistle were elements with which the leaders of romantic revival were out of sympathy, and it was not cultivated to any important degree in the 19th century. It is, however, to be noted that Shelley's use of epistles to Charles Clarke (1816), and Landor's "Te Julian Hasid" (1836), in spite of their romantic colouring, are genuine Horatian epistles and of the pure Augustan type. This type, in English literature, is commonly, though not at all universally, cast in heroic verse. But Daniel employs rime royal and terza rima, while some modern epistles have been cast in short iambic rhymed measures or in blank verse. It is sometimes not easy to distinguish the epistle from the elegy and from the dedication.

For St Paul's Epistles see PAUL, for St Peter's see PETER, for Apocryphal Epistles see APOCRYPHAL LITERATURE, for Plato's see PLATO, &c.

**EPISTYLE** (Gr. εἰς, upon, and στοιχεῖον, column), the Greek architectural term for architrave, the lower member of the entablature of the classic orders (q.v.).

**EPITYLIS** (C. G. Ehrenberg), in zoology, a genus of peritrichous Infusoria with a short oral disc and collar, and a rigid stalk, often branching to form a colony.

**EPISTAPH** (Gr. ἐπίσταφος, sc. λείπον, from εἰς, upon, and ᾱπο, a tomb), strictly, an inscription upon a tomb, though by a natural extension of usage the name is applied to anything written ostensibly for that purpose whether actually inscribed upon a tomb or not. When the word was introduced into English in the 14th century it took the form epitaphy, as well as epitaph, which latter word is used both by Gower and Lydgate. Many of the best-known epitaphs, both ancient and modern, are merely literary memorials, and find no place on sepulchral monuments. Sometimes the intention of the writer to have his production placed upon the grave of the person he has commemorated may have been frustrated, sometimes it may never have existed; what he has written is still entitled to be called an epitaph if it be suitable for the purpose, whether the purpose has been carried out or not. The most obvious external condition that suitability for mural inscription imposes is one of rigid limitation as to length. An epitaph cannot in the nature of things extend to the proportions that may be required in an elegy.

The desire to perpetuate the memory of the dead being universal too, the practice of placing epitaphs upon their graves has been common among all nations and in all ages. And the similarity, amounting sometimes almost to identity, of thought and expression that often exists between epitaphs written more than two thousand years ago and epitaphs written only yesterday is as striking an evidence as literature affords of the close kinship of human nature under the most varying conditions where the same primary elemental feelings are stirred. The grief and hope of the Roman mother as expressed in the touching lines—

"Iagge fili bene quiescas;
Mater tua roget te,
Ut me ad te recipias;
Vale!"

find their echo in similar inscriptions in many a modern cemetery. Probably the earliest epitaphs inscriptions that have come down to us are those of the ancient Egyptians, written, as their mode of sepulture necessitated, upon the sarcophagi and coffins. Those that have been deciphered are all very much in the same form, commencing with a prayer to a deity, generally Osiris or Anubis, on behalf of the deceased, whose name, descent and office are usually specified. There is, however, no attempt to delineate individual character, and the feelings of the survivors are not expressed otherwise than in the fact of a prayer being offered. Ancient Greek epitaphs, unlike the Egyptian, are of great literary interest, deep and often tender in feeling, rich and varied in expression, and generally epigrammatic in form. They are written usually in elegiac verse, though many of the later epitaphs are in prose. Among the gems of the Greek anthology familiar to English readers through translations are the epitaphs upon those who had fallen in battle. There are several ascribed to Simonides on the heroes of Thermopylae, of which the most celebrated is the epigram—

"Go tell the Spartans, thou that passest by,
That here, obedient to their laws, we lie."

A hymn of Simonides on the same subject contains some lines of great beauty in praise of those who were buried at Thermopylae, and these may be regarded as forming a form of the epitaph. In Sparta epitaphs were inscribed only upon the graves of those who had been especially distinguished in war; in Athens they were applied more indiscriminately. They generally contained the name, the descent, the demise, and some account of the life of the person commemorated. It must be remembered, however, that many of the so-called Greek epitaphs are merely literary memorials not intended for monumental inscription, and that in these former scope is naturally given to general reflections, while less attention is paid to biographical details. Many of them, even some of the monumental, do not contain any personal name, as in the one ascribed to Plato—

"I am a shipwrecked sailor's tomb; a peasant's there doth stand:
Thus the same world of Hades lies beneath both sea and land."

Others again are so entirely of the nature of general reflections upon death that they contain no indication of the particular case that called them forth. It may be questioned, indeed, whether several of this character quoted in ordinary collections are epitaphs at all, in the sense of being intended for a particular occasion.

Roman epitaphs, in contrast to those of the Greeks, contained, as a rule, nothing beyond a record of facts. The inscriptions on the urns, of which numerous specimens are to be found in the British Museum, present but little variation. The letters D.M.or D.M.S. (Dies Manibus or Dies Monibus Sacrum) are followed by the name of the person whose ashes are enclosed, his age at death, and sometimes one or two other particulars. The inscription closes with the name of the person who caused the urn to be made, and his relationship to the deceased. It is a curious illustration of the survival of traces of an old faith after it has been formally discarded to find that the letters D.M. are not uncommon on the Christian inscriptions in the catacombs. It has been suggested that in this case they mean Deo Maximo and not Dies Monibus, but the explanation would be quite untenable, even if there were any other undoubted instances of the survival of pagan superstitions in the thought and life of the early Christians. In these very catacomb inscriptions there are many illustrations to be found, apart from the use of the letters D.M., of the union of heathen with Christian sentiment, (see Maitland's *Church in the Catacombs*). The private burial-places for the ashes of the dead were usually by the side of the various roads leading into Rome, the Via Appia, the Via Flaminia, &c. The traveller to or from the city thus passed for miles an almost uninterrupted succession of tombstones, whose inscriptions usually began with the appropriate words Siste Viator or Aspice Viator, the origin doubtless of the "Stop Passenger," which still meets the eye in many parish churchyards of Britain. Another phrase of very common occurrence on ancient Roman tombstones, Sit tibi terra levis ("Light lie the earth upon thee "), has continued in frequent use, as conveying an appropriate sentiment, down to modern times. A remarkable feature of many of the Roman epitaphs was the terrible denunciation they often pronounced upon those who defiled the sepulchre. Such denunciations were not uncommon in later times. A well-known instance is furnished in the lines on Shakespeare's tomb at Stratford-on-Avon, said to have been written by the poet himself—

"Good friend, for Jesus' sake forbear
To dig the dust enclosed here:
Blest be he that spares these bones,
And curst be he that moves my bones."

The earliest existing British epitaphs belonged to the Roman period, and are written in Latin after the Roman form. Specimens are to be seen in various antiquarian museums throughout
the country; some of the inscriptions are given in Bruce's Roman Wall, and the seventh volume of the Corpus Inscriptionum Latinarum edited by Hübner, containing the British inscriptions, is a valuable repository for the earlier Roman epitaphs in Britain. The earliest, of course, are commemorative of soldiers, belonging to the legionaries, but the form of the Latin inscription was afterwards adopted for native Britons. Long after the Roman form was discarded, the Latin language continued to be used, especially for inscriptions of a more public character, as being from its supposed permanence the most suitable medium of communication to distant ages. It is only, in fact, within recent years that Latin has become unusual, and the more natural practice has been adopted of writing the epitaphs of distinguished men in the language of the country in which they lived. While Latin was the chief if not the sole literary language, it was, as a matter of course, almost exclusively used for epitaphial inscriptions. The comparatively few English epitaphs that remain of the 11th and 12th centuries are all in Latin. They are generally confined to a mere statement of the name and rank of the deceased following the words "Hic jacet." Two noteworthy exceptions to this general brevity are, however, to be found in most of the collections. One is the epitaph to Gundrada, daughter of the Conqueror (d. 1085), which still exists at Lewes, though an imperfect state of two of the lines having been lost; another is that to William de Warren, earl of Surrey (d. 1088), believed to have been inscribed in the abbey of St Pancras, near Lewes, founded by him. Both are encomiastic, and describe the character and work of the deceased with considerable fulness and beauty of expression. They are written in Leonine verse. In the 13th century French began to be used in writing epitaphs, and most of the inscriptions to celebrated historical personages between 1200 and 1400 are in that language. Mention may be made of those to Robert, the 3rd earl of Oxford (d. 1221), as given in Weever, to Henry III. (d. 1272) at Westminster Abbey, and to Edward the Black Prince (d. 1376) at Canterbury. In most of the inscriptions of this period the deceased addresses the reader in the first person, describes his rank and position while alive, and, as in the case of the Black Prince, contrasts it with his wasted and lothsome state in the grave, and warns the reader to prepare for the same inevitable change. The epitaph almost invariably closes with a request, sometimes very urgently worded, for the prayers of the reader that the soul of the deceased may pass to glory, and an invocation of blessing, general or specific, upon all who comply. Epitaphs preserved much of the same character after English began to be used towards the close of the 14th century. The following, to a member of the Savile family at Thornhill, is probably even earlier, though its precise date cannot be fixed—

"Bonyes among stonges stys ful steyl gyvelte the sawle wan-
deris were that God wylethe"—

that is, Bones among stones lie full still, whilst the soul wanders whither God willeth. It may be noted here that the majority of the inscriptions, Latin and English, from 1300 to the period of the Reformation, that have been preserved, are upon brasses (see BRASSES, MONUMENTAL). The very curious epitaph on St Bernard, probably written by a monk of Clairvaux, has the peculiarity of being a dialogue in Latin verse.

It was in the reign of Elizabeth that epitaphs in English began to assume a distinct literary character and value, entitling them to rank with those that had hitherto been composed in Latin. We learn from Nash that at the close of the 16th century it had become a trade to supply epitaphs in English verse. There is one on the dowry casser of Pembroke (d. 1651), remarkable for its successful use of a somewhat daring hyperbole. It was written by William Browne, author of Britannia's Pastoral—

"Underneath this sable heare
Lies the subject of all verse;
Sydney's sister, Pembroke's mother;
Dying, ere thou hast another
Fair and learn'd and good as she,
Time will throw his dart at thee.
Marble piles let no man raise
To her name for after days;"

Some kind woman, born as she,
Reading this, like Niobe,
Shall turn marble, and become
Both her mourner and her tomb."

If there be something of the exaggeration of a conceit in the first stanza, it needs scarcely to be pointed out that epitaphs, like every other form of composition, necessarily reflect the literary characteristics of the age in which they were written. The depreciation of marble as unnecessary suggests one of the finest epitaphs in the English language, that by Milton upon Shakespeare.

The epitaphs of Pope are still considered to possess very great literary merit, though they were rated higher by Johnson and critics of his period than they are now.

Dr Johnson, who thought so highly of Pope's epitaphs, was himself a great authority on both the theory and practice of this species of composition. His essay on epitaphs is one of the few existing monographs on the subject, and his opinion as to the use of Latin had great influence. The manner in which he met the delicate insinuated request of a number of eminent men that English should be employed in the case of Oliver Goldsmith was characteristic, and showed the strength of his conviction on the subject. His arguments in favour of Latin were chiefly drawn from its inherent fitness for epitaphical inscriptions and its classical stability. The first of these has a very considerable force, it being admitted that all languages are in themselves so suitable for the purpose; the second is outweighed by considerations that had considerable force in Dr Johnson's time, and have acquired more since. Even to the learned Latin is no longer the language of daily thought and life as it was at the period of the Reformation, and the great body of those who may fairly claim to be called the well-educated classes can only read it with difficulty, if at all. It seems, therefore, little less than absurd, for the sake of a stability which is itself in great part delusive, to write epitaphs in a language unintelligible to the vast majority of those for whose information presumably they are intended. Though a stickler for Latin, Dr Johnson wrote some very beautiful English epitaphs, as, for example, the following on Philips, a musician—

"Philips, whose touch harmonious could remove
The pangs of guilty power or hapless love;
Rest here, distressed by poverty no more,
Here find that calm thou gav'st so oft before;
Sleep undisturbed within this peaceful shrine.
Till angels wake thee with a resounding chime!"

In classifying epitaphs various principles of division may be adopted. Arranged according to nationality they indicate distinctions of race less clearly perhaps than any other form of literature does,—and this obviously because when under the influence of the deepest feeling men think and speak very much in the same way whatever be their country. At the same time the influence of nationality may to some extent be traced in epitaphs. The characteristics of the French style, its grace, clearness, wit and epigrammatic point, are all recognizable in French epitaphs. In the 16th century those of Étienne Pasquier were universally admired. Instances such as "La première au rendez-vous," inscribed on the grave of a mother, Piron's epitaph, written for himself after his rejection by the French Academy—

"Ci-git Piron, qui ne fut rien,
Pas même académicien"

and one by a relieved husband, to be seen at Père la Chaise—

"Ci-git ma femme. Ah! qu'elle est bien
Pour son repos et pour le mien"

might be multiplied indefinitely. One can hardly look through a collection of English epitaphs without being struck with the fact that these represent a greater variety of intellectual and emotional states than those of any other nation, ranging through every style of thought from the sublime to the commonplace, every mood of feeling from the most delicate and touching to the coarse and even brutal. Few subordinate illustrations of the complex nature of the English nationality are more striking.

Epitaphs are sometimes classified according to their authorship and sometimes according to their subject, but neither division
EPITHALAMIUM—EPITHELIAL TISSUES

is so interesting as that which arranges them according to their characteristic features. What has just been said of English episthaphs is, of course, more true of episthaphs generally. They exemplify every variety of sentiment and taste, from lofty pathos and dignified eulogy to coarse boorishry and the vilest scurrility. Merit to which is too frequently confounded, and the comic element prevails among them is a noteworthy circumstance.

It is curious that the most solemn of all subjects should have been frequently treated, intentionally or unintentionally, in a style so ludicrous that a collection of episthaphs is generally one of the most amusing books that can be picked up. In this as in other cases, too, it is to be observed that the unintended humour is generally of a much more entertaining kind than that which is deliberately produced.

See Weever, Ancient Funeral Monuments (1631, 1661, 1662; first ed., 1677); Philippe Labbe, Thesaurus episthaphiorum (Paris, 1666); Thesaurus funerarii extructum ad Donum Ricasie seu Oditie Aicher (1675); Hackett, Select and Remarkable Epitaphs (1755); de Laplace, Epitaphes sérieuses, bonnes, satiriques et burlesques (3 vols., Paris, 1782); Pulleyn, Churchyard Gleanings (c. 1830; L. EPITHALAMIUM (Gr. εἶρη, at or upon, and ἑδάμονος, a nuptial chamber), originally among the Greeks a song in praise of bride and bridegroom, which was sung by a number of boys and girls at the door of the nuptial chamber. According to the scholiast on Theocritus, one form, the καρασιμπρες, was employed at night, and another, the διερπιδρα, to arouse the bride and bridegroom on the following morning. In either case, as was natural, the main burden of the song consisted of invocations of blessing and predictions of happiness, interrupted from time to time by the ancient chorus of ομετερομαιUA. Among the Romans a similar custom was in vogue, but the song was sung by girls only, after the marriage guests had gone, and it contained much more of what modern morality would condemn as obscene.

In the hands of the poets the epithalamium was developed into a special literary form, and received considerable cultivation. Sappho, Anacreon, Stesichorus and Pindar are all regarded as masters of the species, but the finest example preserved in Greek literature is the Ἐρυθρία of Theophrastus, which celebrates the marriage of Menelaus and Helen. In Latin, the epithalamium, imitated from Hesiodic Greek models, was a base form of literature, when Catullus redeemed it and gave it dignity by modelling his Marriage of Thais and Peleus on a lost ode of Sappho. In later times Statius, Ausonius, Sidonius Apollinaris and Claudian are the authors of the best-known epithalamia in classical Latin; and they have been imitated by Buchanan, Scaliger, Sannazar, and a whole host of modern Latin poets, with whom, indeed, the form was at one time in great favour. The names of Ronsard, Malherbe and Scarron are especially associated with the species in French literature, and Marini and Metastasio in Italian. Perhaps no poem of this class has been more universally admired than the Epithalamium of Spenser (1592), though he has found no unworthy rivals in Ben Jonson, Donne and Quaile. At the close of In Memoriam Tennyson has appended a poem, on the nuptials of his sister, which is strictly an epithalamium.

EPITHELIAL, ENDOTHELIAL and GLANDULAR TISSUES, in anatomy. Every surface of the body which may come into contact with foreign substances is covered with a protecting layer of cells closely bound to one another to form continuous sheets. These are epithelial cells (from ὑπόθελος, a nipple). By the formation of outgrowths or ingrowths from these surfaces further structures, consisting largely or entirely of cells directly derived from the surface epithelium, may be formed. In this way originate the central nervous system, the sensitive surfaces of the special sense organs, the glands, and the hairs, nails, &c. The epithelial cells possess typical microscopical characters which enable them to be readily distinguished from all others. Thus the cell outline is clearly marked, the nucleus large and spherical or ellipsoidal. The protoplasm of the cell is usually large in amount and often contains large numbers of granules.

The individual cells forming an epithelial membrane are classified according to their shape. Thus we find flattened, or squamous, cubical, columnar, irregular, ciliated or Variety. flagellated cells. Many of the membranes formed by these cells are only one cell thick, as for instance is the case for the major part of the alimentary canal. In other instances the epithelial membrane may consist of a number of layers of cells, as in the case of the epidermis of the skin. Considering in the first place those membranes of which the cells are in a single layer we may distinguish the following:

1. Columnar Epithelium (figs. 1 and 2).—This variety covers the main part of the intestinal tract, i.e. from the end of the oesophagus to the commencement of the rectum. It is also found lining the ducts of many glands. In a highly typical form it is found covering the villi of the small intestine (fig. 1). The external layer of the cell is commonly modified to form a thin membrane showing a number of very fine

radially arranged lines, which are probably the expression of very minute tubular perforations through the membrane.

2. Cubical Epithelium.—This differs from the former in that the cells are less in height. It is found in many glands and ducts (e.g. the kidney), in the middle ear, chordoid plexuses of the brain, &c.

3. Squamous or Flattened Epithelium (fig. 4).—In this variety the cell is flattened, very thin and irregular in outline. It occurs as the covering epithelium of the alveoli of the lung, of the kidney glomerules and capsule, &c. The surface epithelial cells of a stratified epithelium are also of this type (fig. 4). Closely resembling these cells are those known as endothelial (see later).

4. Ciliated Epithelium (fig. 5).—The surface cells of many epithelial membranes are often provided with a number of very fine protoplasmic processes, cilia. Most commonly the cells from Trachea.

are columnar, but other shapes are also found. During life the cilia are always in movement, and set up a current tending to drive fluid or other material on the surface in one direction along the membrane or tube lined by such epithelium. It is found lining the trachea, bronchi, parts of the nasal cavities and the

uterus, ovary duct, vas deferens, epididymis, a portion of the renal tube, &c.

In the instance of some cells there may be but a single process from the exposed surface of the cell, and then the process is usually of large size and length. It is then known as a flagellum. Such cells are common among the surface cells of many of the simple animal organisms.

When the cells of an epithelial surface are arranged several layers deep, we can again distinguish various types:

1. Stratified Epithelium (figs. 6 and 7).—This is found in the epithelium of the skin and of many mucous membranes (mouth, oesophagus, rectum, conjunctiva, vagina, &c.). Here the surface cells are very much flattened (squamous epithelium), those of the middle layer are polygonal and those of the lowest layer are cubical or columnar. This type of epithelium is found covering surfaces commonly exposed to friction. The surface may be dry as in the skin, or moist, e.g. the mouth. The surface cells are constantly being rubbed off, and are then replaced as new cells grow up from below. Hence the deepest layer, that nearest the blood supply, is a formative layer, and in successive stages from this we can trace the gradual transformation of these protoplasmic cells into scaly cells, which no longer show any sign of being alive. In the moist mucous surfaces the number of cells forming the epithelial layer is usually much smaller than in a dry stratified epithelium.

2. Stratified Ciliated Epithelium.—In this variety the superficial cells are ciliated and columnar, between the bases of these are found fusiform cells and the lowest cells are cubical or pyramidal. This epithelium is found lining parts of the respiratory passages, the vas deferens and the epididymis.

3. Transitional Epithelium (fig. 8).—This variety of epithelium is found lining the bladder, and the appearance observed depends upon the contracted or distended state of the bladder from the preparation was made. If the bladder was contracted the form seen in fig. 8 is obtained. The epithelium is in three or more layers, the superficial one being very characteristic. The cells are cuboidal and fit over the rounded ends of the cells of the next layer. These are pear-shaped, the points of the pear resting on the basement membrane. Between the bases of these cells lie those of the lowermost layer. These are irregularly columnar. If the bladder is distended before the preparation is made, the cells are then found stretched out transversely. This is especially the case with the surface cells, which may then become very flattened.

Considering epithelium from the point of view of function, it may be classified as protective, absorptive or secretory. It may produce special outgrowths for protective or ornamental purposes, such as hairs, nails, horns, &c., and for such purposes it may manufacture within itself chemical material best suited for that purpose, e.g. keratin; here the whole cell becomes modified. In other instances may be seen in the interior of the cells many chemical substances which indicate the nature of their work, e.g. fat droplets, granules of various kinds, protein, mucin, watery granules, glycogen, &c. In a typical absorbing cell granules of material being absorbed may be seen. A secreting cell of normal type forming specific substances may be in its interior until wanted, e.g. fat as in sebaceous and mammary glands, ferment precursors (salivary, gastric glands, &c.), and various excretory substances, as in the renal epithelium.

Initially the epithelial cell might have all these functions, but later came specialization and therefore to most cells a specific work. Some of that work does not require the cell to be at the surface, while for other work this is indispensable, and hence when the surface becomes limited those of the former category are removed from the surface to the deeper parts. This is seen typically in secretory and excretory cells, which usually lie below the surface on to which they pour their secretions. If the secretion required at any one point is considerable, then the secreting cells are numerous in proportion and a typical gland is formed. The secretion is then conducted to the surface by a duct, and this duct is also lined with epithelium.

Glandular Tissues.—Every gland is formed by an ingrowth from an epithelial surface. This ingrowth may from the beginning possess a tubular structure, but in other instances may start as a solid column of cells which subsequently becomes tubulated. As growth proceeds, the column of cells may divide or give off offshoots, in which case a compound gland is formed. In many glands the number of branches is limited, in others (salivary, pancreas) a very large structure is finally formed by repeated growth and subdivision. As a rule the branches do not unite with one another, but in one instance, the liver, this does occur when a reticulated compound gland is produced. In compound glands the more typical or secretory epithelium is found forming the terminal portion of each branch, and the uniting portions form ducts and are lined with a less modified type of epithelial cell.

Glands are classified according to their shape. If the gland retains its shape as a tube throughout it is termed a tubular gland, simple tubular if there is no division (large intestine), compound tubular (fig. 9) if branching occurs (pyloric glands of stomach). In the simple tubular glands the gland may be coiled without losing its tubular form, e.g. in sweat glands. In the second main variety of gland the secreting portion is enlarged and the lumen variously increased in size. These are termed alveolar or saccular glands. They are again subdivided into simple or compound alveolar glands, as in the case of the tubular glands (fig. 10). A further complication in the case of the alveolar glands may occur in the form of still smaller saccular diverticuli growing out from the main sacculi (fig. 11). These are termed alveoli.

The typical secretory cells of the glands are found lining the epidermis.
terminal portions of the ramifications and extend upwards to varying degrees. Thus in a typical acinous gland the cells are restricted to the final alveoli. The remaining tubes are to be considered mainly as ducts. In tubulo-alveolar glands the secreting epithelium lines the alveus as well as the terminal tubule.

The gland cells are all placed upon a basement membrane. In many instances this membrane is formed of very thin flattened cells, in other instances it is apparently a homogeneous membrane, and according to some observers is simply a modified part of the basal surface of the cell, while according to others it is a definite structure distinct from the epithelium.

In the secretory portion of the gland and in the smaller ducts the epithelial layer is one cell thick only. In the larger ducts there are two layers of cells, but even here the surface cell usually extends by a thinned-out stalk down to the basement membrane.

The detailed characters of the epithelium of the different glands of the body are given in separate articles (see Alimentary Canal, &c.). It will be sufficient here to give the more general characters possessed by these cells. They are cubical or conical cells with distinct oval nuclei and granular protoplasm. Within the protoplasm is accumulated a large number of spherical granules arranged in diverse manners in different cells. The granules vary in size in different glands, and in chemical composition, but in all cases represent a store of material ready to be discharged from the cell as its secretion. Hence the general appearance of the cell is found to vary according to the previous degree of activity of the cell. If it has been at rest for some time the cell contains very many granules which swell it out and increase its size. The nucleus is then largely hidden by the granules. In the opposite condition, i.e. when the cell has been actively secreting, the protoplasm is much clearer, the nucleus obvious and the cell shrunken in size, all these changes being due to the extrusion of the granules.

Endothelium and Mesothelium.—Lining the blood vessels, lymph vessels and lymph spaces are found flattened cells apposed to one another by their edges to form an extremely thin membrane. These cells are developed from the middle embryonic layer and are termed endothelium. A very similar type of cells is also found, formed into a very thin continuous sheet, lining the body-cavity, i.e. pleural, pericardial and peritoneal cavities. These cells develop from that portion of the mesoderm known as the mesothelium, and are therefore frequently termed mesothelial, though by many they are also included as endothelial cells.

A mesothelial cell is very flattened, thus resembling a squamous epithelial cell. It possesses a protoplasm with faint granules and an oval or round nucleus (fig. 12). The outline of the cell is irregularly polygonal, and the borders may be finely serrated. The cells are united to one another by an intercellular cement substance which, however, is very scanty in amount, but can be made apparent by staining with silver nitrate when the appearance reproduced in the figure is removed. By being thus united together, the cells form a continuous layer. This layer is pierced by a number of small openings, known as stomata, which bring the cavity into direct communication with lymph spaces or vessels lying beneath the membrane. The stomatal layer of cubical is seen in granular cells. Through these stomata fluids and other materials present in the body-cavity can be removed into the lymph spaces.

Endothelial membranes (fig. 13) are quite similar in structure to mesothelial. They are usually elongated cells of irregular outline and serrated borders.

By means of endothelial or mesothelial membranes the surfaces of the parts covered by them are rendered very smooth, so that movement over the surface is greatly facilitated. Thus the abdominal organs can glide easily over one another within the peritoneal cavity; the blood or lymph experiences the least amount of friction; or again the friction is reduced to a minimum between a tendon and its sheath or in the joint cavities. The cells forming these membranes also possess further physiological properties. Thus it is most probable that they play an active part in the blood capillaries in transmitting substances from the blood into the tissue spaces, or conversely in preventing the passage of materials from blood to tissue space or from tissue space to blood. Hence the fluid of the blood and that of the tissue space need not be of the same chemical composition. (T. G. B.)

FIG. 13.—Endothelial Cells from the Interior of an Artery.

EPITOME (Gr. ἐπίτομα, from εἰπεῖν, to cut short), an abridgment, abstract or summary giving the salient points of a book, law case, &c., a short and concise account of any particular subject or event. By transference epitome is also used to express the representation of a larger thing, concrete or abstract, reproduced in miniature. Thus St Mark's was called by Ruskin the "epitome of Venice," as it embraces examples of all the periods of architecture from the nth to the 19th centuries. This is the same as saying that the Cavendish Museum of Science is an epitome of modern chemistry.

EPOCHE (Gr. ἐποξή, holding in suspense, a pause, from ἐπικνύει, to hold up, to stop), a term for a stated period of time, and so used of a date accepted as the starting-point of an era or of a new period in chronology, such as the birth of Christ. It is hence transferred to a period which marks a great change, whether in the history of a country or a science, such as a great discovery or invention. Thus an event may be spoken of as "epoch-making." The word is also used, synonymously with "period," for any space of time marked by a distinctive condition or by a particular series of events.

In astronomy the word is used for a moment from which time is measured, or at which a definite position of a body or a definite relation of two bodies occurs. For example, the position of a body moving in an orbit cannot be determined unless its position at some given time is known. The given time is then the epoch; but the term is often applied to the mean longitude of the body at the given time.

EPODE, in verse, the third part in an ode, which followed the strophe and the antistrophe, and completed the movement; it was called ἐποδα τειλοιδος by the Greeks. At a certain moment the choirs, which had chanted to right of the altar or stage and then to left of it, combined and sang in unison, or permitted the coryphaeus to sing for them all, standing in the centre. When, with the appearance of Stesichorus and the introduction of choral lyric, the oracular kind of poetry began to be cultivated in Greece, a new form, the χορευτικός, or epode-song, came into existence. It consisted of a verse of trimeter iambic, followed by a dimeter iambic, and it is reported that, although the epode was carried to its highest perfection by Stesichorus, an earlier poet, Archilochus, was really the inventor of this form. The epode soon took a firm place in choral poetry, which it lost when that branch of literature declined. But it extended beyond the ode, and in the early dramatics we find numerous examples of monologues and dialogues framed on the epodic system. In Latin poetry the epode was cultivated, in conscious archaism, both as a part of the ode and as an independent branch of poetry. Of the former class, the epithalamia of Catullus, founded on an imitation of Pindar, present us with examples of strophe, antistrophe and epode; and it has been observed that the celebrated ode of Horace, beginning Quem Horatius fessus erat, possesses this triple character. But the epode is now mainly familiar from an ode of Horace in the second class, for he entitled his fifth book of odes Epodam iiber or the Book of Epodes. He says in the course of these poems, that in composing them he was introducing a new form, at least in Latin literature, and that he was imitating the effect of the iambic distichs invented by Archilochus. Accordingly we find the first ten of these epodes
composed in alternate verses of iambic trimeter and iambic dimeter, thus:—

"At o Deorum quiequid in coelo recti
Terra et humana genus."

In the seven remaining epodes Horace has diversified the measures, while retaining the general character of the distich. This group of poems belongs in the main to the early youth of the poet, and displays a truculence and a controversial heat which are absent from his more mature writings. As he was writing the Archilochus in form, he believed himself justified, no doubt, in repeating the sarcastic violence of his fierce model. The curious thing is that these particular poems of Horace, which are really short lyrical satires, have appropriated almost exclusively the name of epodes, although they bear little enough resemblance to the genuine epode of early Greek literature.

**EPONA**, a goddess of horses, asses and mules, worshipped by the Romans, though of foreign, probably Gallic, origin. The majority of inscriptions and images bearing her name have been found in Gaul, Germany and the Danube countries; of the few that occur in Rome itself most were exhumed on the site of the barracks of the *equites singulares*, a foreign imperial body-guard mainly recruited from the Batavians. Her name does not appear in Tertullian's list of the *indigitis dii*, and Juvenal contrasts her worship unfavourably with the old Roman Numa ritual. Her cult does not appear to have been introduced before imperial times, and she is often associated with Augustus and invoked on behalf of the emperor and the imperial house. Her chief function, however, was to see that the beasts of burden were duly fed, and to protect them against accidents and malicious influence. In the countries in which the worship of Epona was said to have had its origin it was a common belief that certain beings were in the habit of casting a spell over stables during the night. The Romans used to place the image of the goddess, crowned with flowers on festive occasions, in a sort of shrine in the centre of the architrave of the stable. In art she is generally represented seated, with her hand on the head of the accompanying horse or animal.

**Eponymous**, that which gives a name to anything (Gr. *ἐπωνυμοῦ* from *ἐπωνυμία*, a name), a term especially applied to the mythical or semi-mythical personages, heroes, deities, etc., from whom a country or city took its name. Thus Pelops is the giver of the name to the Peloponnesian. At Athens the chief archon of the year was known as the *ἐπωνυμικός*, as the year was known by his name. There was a similar official in ancient Assyria. In ancient times, as in historical and modern cases, a country or city can be named after a real personage, but in many cases the person has been invented to account for the name.

**Epping**, a market town in the Epping parliamentary division of Essex, England, 17 m. N.N.E. from London by a branch of the Great Eastern railway. Pop. of urban district (1901), 3789. The town lies high and Picturesquely, at the northern outskirts of Epping Forest. The modern church of St John the Baptist replaces the old parish church of All Saints in the village of Epping Upland 2 m. N.W. This is in part Norman. There is considerable trade in butter, cheese and sausages.

Epping Forest forms part of the ancient Waltham Forest, which covered the greater part of the county. All the "London Basin," within which the Forest lies, was densely wooded. The Forest became one of the comonable lands of Royal Chases or hunting-gounds. It was threatened with total disafforestation, when under the Epping Forest Act of 1871 a board of commissioners was appointed for the better management of the lands. The corporation of the city of London then acquired the freehold interest of waste land belonging to the lords of the manor, and finally secured 5550 acres, magnificently timbered, to the use of the public for ever, the tract being declared open by Queen Victoria in 1882. The Ancient Court of Verderers was also revived, consisting of a hereditary lord warden together with four verderers elected by freeholders of the county. The present forest lies between the valleys of the Roding and the Lea, and extends southward from Epping to the vicinity of Woodford and Walthamstow, a distance of about 7 m. It is readily accessible from the villages on its outskirts, such as Woodford, Chingford and Loughton, which are served by branches of the Great Eastern railway. These are centres of residential districts, and, especially on public holidays in the summer, receive large numbers of visitors.

**Epps**, the name of an English family, well known in commerce and medicine. In the second half of the 18th century they had been settled near Ashford, Kent, for some generations, claiming descent from an equestry of Charles II., but were reduced in circumstances, when John Epps rose to prosperity as a provision merchant in London, and restored the family fortunes. He had four sons, of whom John Epps (1809-1869), George Napoleon Epps (1815-1854), and James Epps (1821-1907) were notable men of their day, the two former as prominent doctors who were ardent converts to homoeopathy, and James as a homoeopathic chemist and the founder of the great cocoa business associated with his name. Among Dr G. N. Epp's children were Dr Washington Epps, a well-known homoeopathist, Lady Alma-Tadema, and Mrs Edmund Goose.

**Épreshnîl** (Épreshnîl or Éprémenil), Jean Jacques Dalva (1745-1794), French magistrate and politician, was born at La Rochelle on 15 July 1745. Owing to the death of Augustin, his father being a colleague of Dupleix. Returning to France in 1750 he was educated in Paris for the law, and became in 1775 conseiller in the parlement of Paris, where he soon distinguished himself by his zealous defence of its rights against the royal prerogative. He showed bitter enmity to Marie Antoinette in the matter of the diamond necklace, and on the 15th of November 1787 he was the spokesman of the parlement in demanding the impeachment of the ministers. When the court retaliated by an edict depriving the parlement of its functions, Épreshnîl bribed the printers to supply him with a copy before its promulgation, and this he read to the assembled parlement. A royal officer was sent to the palais de justice to arrest Épreshnîl and his chief supporter Goislard de Montsabert, but the parlement (5th of May 1788) declared that they were all Épreshnîls, and the arrest was only effected on the next day on the voluntary surrender of the two members. After four months' imprisonment on a charge of State supremacy, Épreshnîl emerged as a popular hero, and was returned to the states-general as deputy of the nobility of the outlying districts of Paris. But with the rapid advance towards revolution his views changed; in his Réflexions impartières... (January 1789) he defended the monarchy, and he led the party among the nobility that refused to meet with the third estate until summoned to do so by royal command. In the Constituent Assembly he opposed every step towards the destruction of the monarchy. After a narrow escape from the fury of the Parisian populace in July 1792 he was imprisoned in the Abbaye, but was set at liberty before the September massacres. In September 1793, however, he was arrested at Le Havre, taken to Paris, and denounced to the Convention as an agent of Pitt. He was brought to trial before the revolutionary tribunal on the 21st of April 1794, and was guillotined the next day.

D'Eprémenil's speeches were collected in a small volume in 1823. See also H. Carle, *Un Précurseur inconscient de la Révolution* (Paris, 1897).

**Epsom**, a market town in the Epsom parliamentary division of Surrey, England, 14 m. S.W. by S. of London Bridge. Pop. of urban district (1901), 10,915. It is served by the London & South-Western and the London, Brighton & South Coast railways, and on the racecourse on the neighbouring Downs there is a station (Tattenham Corner) of the South-Eastern & Chatham railway. The principal building is the parish church of St Martin, a good example of modern Gothic, the interior of which contains some fine sculptures by Flaxman and Chantrey. Epsom (a contraction of Ebbs, till the new of the manor) first came into notice when mineral springs were discovered there.
about 1618. For some time after their discovery the town enjoyed a wonderful degree of prosperity. After the Restoration it was often visited by Charles II., and when Queen Anne came to the throne, her husband, Prince George of Denmark, made it his frequent resort. Epsom gradually lost its celebrity as a spa, but the annual races held on its downs arrested the decay of the town. Races appear to have been established here as early as James I's residence at Nonsuch, but they did not assume a permanent character until 1730. The principal races—the Derby and Oaks—are named after one of the ears of Derby and his seat, the Oaks, which is in the neighbourhood. The last Derby was won by the daughter of the former in the former year. The spring races are held on a Thursday and Friday towards the close of April; and the great Epsom meeting takes place on the Tuesday and three following days immediately before Whitsuntide,—the Derby on the Wednesday, and the Oaks on the Friday (see Horse-Racing). The grand stand was erected in 1829, and subsequently enlarged; and there are numerous training stables in the vicinity. Close to the town are the extensive buildings of the Royal Medical Benevolent College, commonly called Epsom College, founded in 1855. Scholars on the foundation must be the sons of medical men, but in other respects the school is open. In the neighbourhood is the Durand's, a seat of the earl of Rosebery.

**EPSON SALTS**, heptahydrated magnesium sulphate, MgSO₄·7H₂O, the magnesia sulphas of pharmacy (Ger. Bitter-so). It occurs dissolved in sea water and in most mineral waters, especially in those at Epsom (from which place it takes its name), Nidda, Saidtssts and Pultna. It also occurs in nature in fibrous excrences, constituting the mineral epsomite or hair-salt; and as compact masses (rechardite), as in the Stassfurt mines. It is also found associated with limestone, as in the Mammoth Caves, Kentucky, and with gypsum, as at Montmartre. Epsom salts crystallizes in the orthorhombic system, being isomorphous with the corresponding zinc and nickel sulphates, and also with magnesium chromate. Occasionally monoclinic crystals are obtained by crystallizing from a strong solution. It is used in the arts for weighting cotton fabrics, as a top-dressing for clover hay in agriculture, and in dyeing. In medicine it is frequently employed as a hydrogogative purgative, specially valuable in febrile diseases, in congestion of the portal system, and in the obstinate constipation of painters' colic. In the last case it is combined with potassium iodide, the two salts being exceedingly effective in causing the elimination of lead from the system. It is also very useful as a supplement to mercury, when the latter is insufficient to cope with the disease. The salt should be given a few hours after the mercury, e.g., in the early morning, the mercury having been given at night. It possesses the advantage of exercising but little irritant effect upon the bowels. Its nauseous bitter taste may to some extent be concealed by acidifying the solution with dilute sulphuric acid, and in some cases where full doses have failed the repeated administration of small ones has proved effectual.

For the manufacture of Epsom salts and for other hydrated magnesium sulphates see MAGNESIUM.

**EQUATION** (from Lat. aequatio, aequare, to equalize), an expression or statement of the equality of two quantities. Mathematical equivalence is denoted by the sign =, a symbol invented by Robert Recorde (1500-1558), who considered that nothing could be more equal than two equal and parallel straight lines. An equation states an equality existing between two classes of quantities, distinguished as known and unknown; those correspond to the data of a problem and the terms to unknowns. It is the purpose of the mathematician to state the unknowns separately in terms of the knowns; this is called solving the equation, and the values of the unknowns so obtained are called the roots or solutions. The unknowns are usually denoted by the terminal letters, e.g., x, y, z, of the alphabet, and the knowns are either actual numbers or are represented by the literals a, b, c, &c., i.e., the introductory letters of the alphabet. Any number or literal which expresses what multiple of term occurs in an equation is called the coefficient of that term; and the term which does not contain an unknown is called the absolute term. The degree of an equation is equal to the greatest index of an unknown in the equation, or to the greatest sum of the indices of products of unknowns. If each term has the sum of its indices the same, the equation is said to be homogeneous. These definitions are exemplified in the equations:

1. \(ax^2+2bx+c=0\),
2. \(xy+x+y=x^2\),
3. \(a_1x_1^2+b_1x_1y=c_1\).

In (1) the unknowns are \(x\) and the knowns \(a, b, c\); the coefficients of \(x^2\) and \(x\) are \(a\) and \(2b\); the absolute term is \(c\), and the degree is 2. In (2) the unknowns are \(x, y\), and the known \(a\); the degree is 2, i.e., the sum of the indices in the term \(xy\). (3) is a homogeneous equation of the second degree in \(x\) and \(y\). Equations of the first degree are called simple or linear; of the second, quadratic; of the third, cubic; of the fourth, biquadratic; of the fifth, quintic, and so on. Of equations containing only one unknown the number of roots equals the degree of the equation; thus a simple equation has one root, a quadratic two, a cubic three, and so on. If one equation be given containing two unknowns, as for example \(ax+by=c\) or \(ax^2+by^2=c\), it is seen that there are an infinite number of roots, for we can give \(x, y\), any value and then determine the corresponding value of \(y\); such an equation is called indeterminate; of the examples chosen the first is a linear and the second a quadratic indeterminate equation. In general, an indeterminate equation results when the number of unknowns exceeds by unity the number of equations. If, on the other hand, we have equations containing two unknowns, it is possible to solve the equations separately for one unknown, and then if we equate these values we obtain an equation in one unknown, which is soluble if its degree does not exceed the fourth. By substituting these values the corresponding values of the other unknown are determined. Such equations are called simultaneous; and a simultaneous system is a series of equations equal in number to the number of unknowns. Such a system is only always soluble, for it may happen that by the laws of algebra no equation is implied by the others; when this occurs the system is called forismatic or forotic. An identity differs from an equation inasmuch it cannot be solved, the terms mutually cancelling; for example, the expression \(x^2-a^2=(x-a)(x+a)\) is an identity, for on reduction it gives \(x=a\). It is usual to employ the sign \(\equiv\) to express this relation.

An equation admits of description in two ways:—(1) It may be regarded purely as an algebraic expression, or \(\equiv\) as a geometrical locus. In the first case there is obviously no limit to the number of unknowns and to the degree of the equation; and, consequently, there can be no limit to the number of equations. In the second case the number of unknowns is limited to three, corresponding to the three dimensions of space; the degree is unlimited as before. It must be noticed, however, that by the introduction of appropriate conditions of degree equal to the number of unknowns, any equation theoretically admits of geometrical visualization, in other words, every equation may be represented by a geometrical figure and every geometrical figure by an equation. Corresponding to these two aspects, there are two typical methods by which equations can be solved, viz., the algebraic and geometric. The former leads to exact results, or by methods of approximation, to results correct to any required degree of accuracy. The latter can only yield approximate values: when theoretically exact constructions are available there is a source of error in the draftsmanship; and when the constructions are only approximate, the accuracy of the results is more problematical. The geometrical aspect, however, is of considerable value in discussing the theory of equations.

**History.**—There is little doubt that the earliest solutions of equations are given in the Rhind papyrus, a hieratic document of some 2000 years before our era. The problems solved were of an arithmetical nature, assuming such forms as "a mass and its \(\frac{1}{10}\) makes 19." Calling the unknown mass \(x\), we have given \(x+\frac{x}{10}=19\), which is a simple equation. Arithmetical problems also gave rise to equations involving two unknowns; the early Greeks were familiar with and solved simultaneous linear equations, but indeterminate equations, such, for instance, as the system given in the "cattle problem" of Archimedes, were not seriously studied until Diophantus solved many particular problems. Quadratic equations arose in the Greek investigations in the doctrine of proportion, and
although they were presented and solved in a geometrical form, the methods employed have no relation to the generalized conception of algebraic geometry which represents a curve by an equation and vice versa. The simplest quadratic arose in the construction of a mean proportional (2) between two lines (a, b), or in the construction of a square equal to a given rectangle; for we have the proportion $\frac{ax}{x^2} = \frac{y^2}{ax}$, i.e. $x^2 = ab$. A more general equation, viz. $x^2 - ax + y^2 = 0$, is the algebraic equivalent of the problem of drawing a line in a given position; this is known as Euclid, ii. 11. It is possible that Diophantus was in possession of an algebraic solution of quadratic equations; he recognized, however, only one root, the interpretation of both being first effected by the Hindu Bhaskara. A simple cubic equation was presented in the problem of finding two mean proportionals, $x$, $y$, between two lines, one double the other. We have $ax = 2xy = y^2$, which gives $x = ay$ and $y = 2a$; eliminating $y$ we obtain $x^3 = 8a^3$, a simple cubic. The Greeks could not solve this equation, which also arose in the problems of duplicating a cube and trisecting an angle, by the rule and compasses, but only by mechanical curves such as the cissoid, conchoid and quadratrix. Such solutions were much improved by the Arabs, who also solved both cubics and biquadratics by means of intersecting conics; at the same time, they developed methods, originated by Diophantus and improved by the Hindus, for finding approximate roots of numerical equations by algebraic processes. The algebra of the geometric and biquadratic equations was developed in the 16th century by S. Ferro, N. Tartaglia, H. Cardan and L. Ferrari (see Algebra: History). Many fruitless attempts were made to solve algebraically the quintic equation until P. Ruffini and N. H. Abel proved the problem to be impossible; a solution involving elliptic functions has been given by C. Hermite and L. Kronecker, while F. Klein has given another solution.

In the geometric treatment of equations the Greeks and Arabs based their constructions upon certain empirically deduced properties of the curves and figures employed. Knowing various metrical relations, generally expressed as proportions, it was found possible to solve particular equations, but a general method was wanting. This lacuna was not filled until the 17th century, when Descartes discovered the general theory which explained the nature of such solutions, in particular those wherein conics were employed, and, in addition, established the most important facts that every equation represents a geometrical locus, and conversely. To represent equations containing two unknowns, $x$, $y$, we chose two axes of reference mutually perpendicular, and measured $x$ along the horizontal axis and $y$ along the vertical. Then by the methods described in the article Geometry: Analytical, he showed that — (1) a linear equation represents a straight line, and (2) a quadratic represents a conic. If the equation be homogeneous or break up into factors, it represents a number of straight lines in the first case, and the loci corresponding to the factors in the second. The solution of simultaneous equations is easily seen to be the values of $x$, $y$ corresponding to the intersections of the loci. It follows that there is only one value of $x$, $y$ which satisfies two linear equations, since two lines intersect in one point only; two values which satisfy a linear and quadratic, since a line intersects a conic in two points; and four values which satisfy two quadratics, since two conics intersect in four points. It may happen that the curves do not actually intersect in the theoretical maximum number of points; the principle of continuity (see Geometrical Continuity) shows us that in such cases some of the roots are imaginary. To represent equations involving three unknowns, $x$, $y$, $z$, a third axis is introduced, the $z$-axis, perpendicular to the plane $xy$ and passing through the intersection of the lines $x$, $y$. In this notation a linear equation represents a plane, and two linear simultaneous equations represent a line, i.e. the intersection of two planes; a quadratic equation represents a surface of the second degree. In order to graphically consider equations containing only one unknown, it is convenient to equate the terms to $y$; i.e. if the equation be $f(x) = 0$, we take $y = f(x)$ and construct this curve on rectangular Cartesian co-ordinates by determining the values of $y$ which correspond to chosen values of $x$, and describing a curve through the points so obtained. The intersections of the curve with the axis of $x$ gives the real roots of the equation; imaginary roots are obviously not represented.

In this article we shall treat of: (1) Simultaneous equations, (2) indeterminate equations, (3) cubic equations, (4) biquadratic equations, (5) theory of equations. Simple, linear simultaneous and quadratic equations are treated in the article Algebra; for differential equations see Differential Equations.

I. Simultaneous Equations.

Simultaneous equations which involve the second and higher powers of the unknown can sometimes be solved. No general rules can be given, and the solution of any particular problem will largely depend upon the student's ingenuity. Here we shall only give a few typical examples.

1. Equations which may be reduced to linear equations. — Ex. To solve $x(s-a) = y(s-b) = z(s-c) = xy + xz + yz = 0$. Multiply the equations by $y$, $z$ and $x$ respectively, and divide the sum by $xyz$; then

$$\frac{x}{x} + \frac{y}{y} + \frac{z}{z} = 0$$

(1).

Multiply by $x$, $y$ and $z$, and divide the sum by $xyz$; then

$$\frac{a}{x} + \frac{b}{y} + \frac{c}{z} = 0$$

(2).

From (1) and (2) by cross multiplication we obtain

$$\frac{x(s-a)}{(s-a)} = \frac{y(s-b)}{(s-b)} = \frac{z(s-c)}{(s-c)} = \lambda$$

(suppose) (3).

Substituting for $x$, $y$ and $z$ in $x(s-a)$ we obtain

$$3abc = (a^2 + b^2 + c^2)$$

(4).

and therefore $x$, $y$ and $z$ are known from (3). The same artifice solves the equations $x^2 = y^2 = z^2 = x+y+z$. Substituting which are homogeneous and of the same degree. — These equations can be solved by substituting $y = mx$. We proceed to explain this method by an example.

Ex. To solve $x^2 + y^2 + z^2 = 31xy + 32yz + 33zx = 45$. Substituting $y = mx$ in both these equations, and then dividing, we obtain $31m^3 - 3m^2 + 3m - 1 = 0$. The roots of this quadratic are $m = 1$, $m = 3$, and therefore $2x = y = 3x$. In solving $2x = y$ and $3x = y$, we obtain $x^2 + (y - 1)^2 = 15$. Substituting $y = 1$, which gives $x = 1$, $x = 2$. Taking the second value, $x = 3$, and substituting for $y$, we obtain $x^2 + (3 - 1)^2 = 15$. Substituting which gives $x = 4$, $y = 3$. Therefore the solutions are $x = 1$, $y = 2$, and $x = 3$, $y = 3$. Other artifices have to be adopted to solve other forms of simultaneous equations, for which the reader is referred to J. J. Milne, Companion to Weekly Problem Papers.

II. Indeterminate Equations.

1. When the number of unknown quantities exceeds the number of equations, the equations do not admit of invariable solutions, and are therefore said to be indeterminate. Thus if it be required to find two numbers such that their sum be 10, we have two unknown solutions, say $x$ and $y$, and only one equation, viz. $x + y = 10$, which may evidently be satisfied by innumerable different values of $x$ and $y$, if fractional solutions be admitted. It is, however, usual, in such cases, to restrict values of the numbers sought to positive integers, and therefore, in this case, we can have only those nine solutions,

$$x = 1, 2, 3, 4, 5, 6, 7, 8, 9$$

$$y = 9, 8, 7, 6, 5, 4, 3, 2, 1$$

which indeed may be reduced to five; for the first four become the same as the last four, by simply changing $x$ into $y$, and the contrary. This branch of analysis was extensively studied by Diophantus, and is sometimes termed the Diophantine Analysis.

2. Indeterminate problems are of different kinds, according to the dimensions of the equation which is obtained after all the unknown quantities but two have been eliminated by means of the given equations. Those of the first order lead always to equations of the form

$$ax + by = c$$

where $a$, $b$, $c$ denote given whole numbers, and $x$, $y$ two numbers to be found, so that both may be integers. That condition may be fulfilled, it is necessary that the coefficients $a$, $b$ have no common divisor which is not also a divisor of $c$; for if $a = md$ and $b = m$, then $mdx + my = mdx + mdy = md(x + y) = c$, but $d$, $e$, $y$ are supposed to be whole numbers, therefore $c/m$ is a whole number; hence $m$ must be a divisor of $c$.

Of the four forms expressed by the equation $ax + by = c$, it is obvious that $ax + by = -c$ has no positive integral solutions. Also $-ax - by = c$ is equivalent to $by - ax = -c$, and so we have only to consider the forms $ax + by = c$. Before proceeding to the general solutions of these equations we will give a numerical example.

To solve $2x + 3y = 25$ in positive integers. From the given equation

$$2x + 3y = 25$$
we have \(x = (25 - 3y)/2 = 12 - y - (y-1)/2\). Now, since \(x\) must be a whole number, it follows that \((y-1)/2\) must be a whole number. Let us assume \((y-1)/2 = n\), then \(y = 1 + 2n\); and \(x = 11 - 2n\), where \(n\) might be any whole number whatever; if there were no power \(x\) higher than the first. Let us assume \(\sqrt{(3^2) - q} = p - mg\); thus we have \(p^2 + mg^2 = 3^2 p^2 q + m^2 q^2\) and \(r = 2mp + m^2 g\), and as this equation involves only the first power of \(x\), we may by proper reduction obtain from it rational values of \(x\) as in the three foregoing \(3\). The application of the preceding general methods of resolution to any particular case will be easy; we shall therefore conclude with a single example.

\(E\)x. It is required to find two square numbers whose sum is a given square number.

To be the given square number, and \(x, y\) the numbers required; then, by the equation, \(x^2 + y^2 = a\), and \(y = \sqrt{(x^2 - a)}\). This equation is evidently of such a form as to be resolvable by the method employed in article 1. Accordingly, by comparing \(x^2 + y^2\) with the general expression \(x^2 + y^2 = x + y\), we have \(g = a, b = c, e = 1, d = 1\), and substituting these values in the formulae, and also \(-n + m\), we find \(x = 2an, y = \sqrt{(a^2 - 1)}\).

If \(a = n^2 + 1\), there results \(x = 2n, y = n^2 - 1, a = n^2 + 1\). Hence if \(r\) be an even number, the three sides of a rational right-angled triangle are \((a - r)/2, (a + r)/2, a\). If \(r\) be an odd number, they become (dividing by 2) \(r, (a^2 - 1)/2, a\).

For example, if \(r = 4, 4, 4^2 - 1, 4, a = 3, 5, 4\) are the sides of a right-angled triangle; if \(r = 7, 7, 24, 25\) are the sides of a right-angled triangle.

III. Cubic Equations.

1. Cubic equations, like all equations above the first degree, are divided into two classes: they are said to be pure when they contain only one unknown quantity and adjoint when they contain two or more powers of that quantity.

Pure cubic equations are therefore of the form \(x^3 = r\); and hence it appears that a value of the simple power of the unknown quantity may always be found without difficulty, by extracting the cube root of each side of the equation. We shall consider the equation \(x^3 = c^2\) more fully. This is decomposable into the factors \(x - c\) and \(x^2 + cx + c^2\). The roots of this cubic equation are \(x = 1, \sqrt{-1 - \sqrt{-3}}, \sqrt{-1 + \sqrt{-3}}\) and we see that the equation \(x^3 = c^2\) has three roots, namely, one real root \(c\) and two imaginary roots \(\sqrt{-1 - \sqrt{-3}}, \sqrt{-1 + \sqrt{-3}}\). By making \(c\) equal to unity, we observe that the imaginary roots \((1 + \sqrt{-3})/2, (1 - \sqrt{-3})/2\) are the imaginary cube roots of unity, which are generally denoted by \(\omega, \omega^2\), for it is easy to show that \((\omega - 1 - \sqrt{-3})/2 = 1 - \sqrt{-1 - \sqrt{-3}}\).

2. Let us now consider such cubic equations as have all their terms, and which are therefore of this form, \(x^3 + Ax^2 + Bx + C = 0\), where \(A, B\) and \(C\) denote known quantities, either positive or negative.

This equation may be transformed into another in which the second term is wanting by the substitution \(x = y - A/3\). This transformation is a particular case of a general theorem. Let \(x^3 + Ax^2 + Bx + C = 0\). Suppose \(y = x + A/3\), then \(x = y - A/3\), and \(y^3 = x^3 + Ax^2 + Bx + C\). Expand each term by the binomial theorem, and let us first fix our attention on the coefficient of \(x^3\). By this process we obtain \(y^3 = x^3 + Ay^2 + (A^2/3)x + (A^2/27)\). Now \(x^3 + Ax^2 + Bx + C = 0\) and \(y^3 = x^3 + Ay^2 + (A^2/3)x + (A^2/27)\) which are two quantities subject to the relation \(y = x - A/3\) and if we suppose \(y^3 = y^3 = 0\), they are completely determined. This leads to \(y^3 + Ay^2 + (A^2/3)y + (A^2/27) = 0\). Therefore \(y\) and \(x\) are the roots of the quadratic \(x^2 + r^2 = 0\) therefore \(x^2 = 1\), \(y^2 = 1\), and \(y = \pm r\), \(x = \pm r\).

Thus we have obtained a value of the unknown quantity \(y\), in terms of the known quantities \(r, A\) and \(C\); therefore the equation is resolved.

3. But this is only one of three values which \(y\) may have. Let us, for the sake of brevity, denote the corresponding \(y\) by \(\alpha, \beta, \gamma\).

\(A = -Br - C\), \(B = \beta r + \gamma r + \alpha r\), \(C = \beta^2 r + \gamma^2 r + \alpha^2 r\). Now if we observe that \(\alpha = \beta = \gamma\), it will immediately appear that \(\alpha + \beta + \gamma\) has these values,

\(t = 3\sqrt[3]{\alpha}, v = \sqrt[3]{\alpha}\), \(w = \sqrt[3]{\alpha}\).

To determine the correct value of \(\alpha, \beta, \gamma\), \(\alpha, \beta, \gamma\), we must consider that \(-1 = \lambda(\beta, \gamma)\).

Now if we observe that \(\alpha = 1\), it will immediately appear that \(\alpha + \beta + \gamma\) has these values,

\(t = 3\sqrt[3]{\alpha}, v = \sqrt[3]{\alpha}\), \(w = \sqrt[3]{\alpha}\).

To determine the correct value of \(\alpha, \beta, \gamma\), \(\alpha, \beta, \gamma\), we must consider that \(-1 = \lambda(\beta, \gamma)\).

Now if we observe that \(\alpha = 1\), it will immediately appear that \(\alpha + \beta + \gamma\) has these values,
EQUATION

The first of these formulae is commonly known by the name of Cardan's rule (see Algebra; History).

The formula given above for the roots of a cubic equation may be put under a different form, better adapted to the purposes of arithmetical calculation, as follows:—Because 

\[ x = \frac{-b + \sqrt{b^2 - 4ac}}{2a} \]

hence it appears that the three values of \( y \) may also be expressed thus:

\[ y = \frac{a}{2} - \frac{b}{2a} + \sqrt{\left(\frac{b}{a}\right)^2 - 4} \]

\[ y = \frac{a}{2} - \frac{b}{2a} - \sqrt{\left(\frac{b}{a}\right)^2 - 4} \]

\[ y = \frac{b}{2a} - \sqrt{\left(\frac{b}{a}\right)^2 - 4} \]

See below, Theory of Equations, §§ 16 et seq.

IV. Biquadratic Equations.

1. When a biquadratic equation contains all its terms, it has this form:

\[ x^4 + ax^2 + bx + c = 0 \]

where \( a, b, c \) are known quantities.

We shall first consider pure biquadratics, or such as contain only the first and last terms, and therefore are of this form, \( x^4 + bx + c \). In this case it is evident that \( x \) must be readily had by two extractions of the square root; by the first we find \( x = \sqrt{b} \), and by the second \( x = -\sqrt{b} \). This, however, is only one of the values which \( x \) may have; for since \( x^2 - b \), therefore \( x^4 - b^2 = o \); but \( x^4 - b^2 \) may be resolved into two factors \( x^2 - b \) and \( x^2 + b \), each of which admits of a similar resolution; for \( x^2 - b = (x - b)(x + b) \) and \( x^2 + b = (x + b)(x - b) \). Hence it appears that the equation \( x^4 - b^2 = o \) may also be expressed thus:

\[ (x - b)(x + b)(x^2 - b) = 0 \]

so that \( x \) may have these four values,

\[ +b, -b, +\sqrt{b}, -\sqrt{b} \]

two of which are real, and the others imaginary.

2. Next to pure biquadratics in respect of easiness of resolution, are those which are the second and fourth terms, and therefore have this form:

\[ x^4 + ax^2 + b + c = 0 \]

These may be resolved in the manner of quadratic equations; for if we put \( y = x^2 \), we have

\[ y^2 + ay + b + c = 0 \]

from which we find \( y = -\frac{a}{2} \pm \sqrt{\frac{a^2}{4} - b - c} \), and therefore

\[ x = \pm \sqrt{-\frac{a}{2} \pm \sqrt{\left(\frac{a}{2}\right)^2 - b - c}} \]

3. When a biquadratic equation has all its terms, its resolution may be always reduced to that of a cubic equation. There are various methods by which such a reduction may be effected. The following was first given by Leonhard Euler in the Petersburg Commentaries, and afterwards explained more fully in his Elementa of Algebra.

We have already explained how an equation which is complete in its terms may be transformed into another of the same degree, but which wants the second term; therefore any biquadratic equation may be reduced to this form,

\[ y^4 + px^2 + 2q^2 = 0 \]

where the second term is wanting, and where \( p, q \) are two numbers.

That we may form an equation similar to the above, let us assume

\[ y = \sqrt{a + b + c} \]

and also suppose that the letters \( a, b, c \) denote the roots of the cubic equation

\[ x^3 + px^2 + qx + R = 0 \]

then, from the theory of equations we have

\[ a + b + c = -p \]

\[ ab + ac + bc = q \]

\[ abc = R \]

We square the assumed formula

\[ y = \sqrt{a + b + c} \]

and obtain

\[ y^4 = a + b + c + 2\sqrt{ab + ac + bc} + \sqrt{ab + ac + bc} \]

or, substituting \(-P\) for \( a + b + c \), and transposing,

\[ y^4 + P^2 = 2\sqrt{ab + ac + bc} \]

Let this equation be also squared, and we have

\[ y^8 + 2p \sqrt{y^4} + p^2 = 4(ab + ac + bc) + 8b(\sqrt{ab} + \sqrt{ac}) + 2\sqrt{abc} \]

and since

\[ ab + ac + bc = Q \]

\[ a + b + c = R \]

the same equation may be expressed thus:

\[ y^8 + 2p \sqrt{y^4} + p^2 = 4(ab + ac + bc) + 8b(\sqrt{ab} + \sqrt{ac}) + 2\sqrt{abc} \]

Thus we have the biquadratic equation

\[ y^8 + 2p \sqrt{y^4} + p^2 = 4R \sqrt{y^4} + 4Q \]

or

\[ y^8 + 2p \sqrt{y^4} + p^2 = 4R \sqrt{y^4} + 4Q \]

4. In order to apply this resolution to the proposed equation

\[ y^4 + px^2 + qy^2 + r = 0 \]

we must express the assumed coefficients \( P, Q, R \) by means of \( p, q, r \), the coefficients of that equation. For this purpose let us compare the equations

\[ y^4 + px^2 + qy^2 + r = 0 \]

and it immediately appears that

\[ P = p, \quad Q = q(p^2 - 4), \quad R = q^2 \]

Hence it follows that the roots of the proposed equation are generally expressed by the formula

\[ y = \sqrt{a + b + c} \]

where \( a, b, c \) denote the roots of this cubic equation,

\[ a^2 + b^2 + c^2 = 0 \]

But to find each particular root, we must consider, that as the square root of a number may be either positive or negative, so each of the quantities \( a, b, c \) may have either the sign + or - prefixed to it; and hence our formula will give eight different expressions for the root. It is, however, to be observed, that as the product of the three quantities \( a, b, c \) must be equal to \( R \) or to \(-R \); when \( q \) is positive, their product must be a positive quantity, and this can only be effected by making either one or three of them negative; again, when \( q \) is negative, their product must be a positive quantity; so that in this case they must either all be positive, or two of them must be negative. These considerations enable us to determine that four of the eight expressions for the root belong to the case in which \( q \) is positive, and the other four to that in which it is negative.

5. We shall now give the result of the preceding investigation in the form of a practical rule; and as the coefficients of the cubic equation which has been found involve fractions, we shall transform it into another, in which the coefficients are integers, by supposing

\[ x = \sqrt[4]{4} \]

Thus the equation

\[ y^4 + px^2 + qy^2 + r = 0 \]

becomes, after reduction,

\[ y^4 + 2p + (p^2 - 4) - q^2 = 0 \]

it also follows, that if the roots of the latter equation are \( a, b, c \), the roots of the former are \( \sqrt[4]{4}a, \sqrt[4]{4}b, \sqrt[4]{4}c \), so that our rule may now be expressed thus:

Let \( y^4 + px^2 + qy^2 + r = 0 \) be any biquadratic equation wanting its second term. Form this cubic equation

\[ y^3 + p^3 + (p^2 - 4) - q^2 = 0 \]

and find its roots, which let us denote by \( a, b, c \).

Then the roots of the proposed biquadratic equation are,

when \( q \) is positive,

\[ y = \sqrt[4]{4}a, \sqrt[4]{4}b, \sqrt[4]{4}c \]

when \( q \) is negative,

\[ y = \sqrt[4]{4}a, \sqrt[4]{4}b, \sqrt[4]{4}c \]

See also below, Theory of Equations, §§ 17 et seq. (X.)

V. Theory of Equations.

1. In the subject of Theory of Equations the term equation is used to denote an equation of the form \( x^n = p_1 x^{n-1} + \ldots + p_n = 0 \), where \( p_1, p_2, \ldots, p_n \) are regarded as known, and \( x \) as a quantity to be determined; for shortness the equation is written \( f(x) = 0 \).

The equation may be numerical; that is, the coefficients \( p_1, p_2, \ldots, p_n \) are then numbers—understanding by number a quantity of the form \( a + \beta \) (where \( a \) and \( \beta \) having any positive or negative real values whatever, or say each of these is regarded as susceptible of continuous variation from an indefinitely large positive to an indefinitely large positive value), and \( \beta \) denoting \(-1\).

Or the equation may be algebraical; that is, the coefficients are not then restricted to denote, or are not explicitly considered as denoting, numbers.

1. We consider first numerical equations. (Real theory, 2-6; Imaginary theory, 7-10.)

Real Theory.

2. Postponing all consideration of imaginaries, we take in the first instance the coefficients to be real, and attend only to the real roots (if any); that is, \( p_1, p_2, \ldots, p_n \) are real positive or negative quantities, and a root \( a \), if it exists, is a positive or negative quantity such that \( a^n = p_1 a^{n-1} + \ldots + p_n = 0 \), or say, \( f(a) = 0 \).

It is very useful to consider the curve \( y = f(x), \)—or, what would come to the same, the curve \( Axy = f(x), \) —but it is better to retain the first-mentioned form of equation, drawing, if need be, the ordinate \( y \) on a reduced scale. For instance, if the given equation be \( x^2 - 6x + 11 = 0 \), then the curve

The coefficients were selected so that the roots might be nearly 1, 2, 3.
EQUATION

\[ y = x^2 - 6x + 12 \]  
\[ y = 0 \]

is as shown in fig. 1, without any reduction of scale for the ordinate.

It is clear that, in general, \( y \) is a continuous one-valued function of \( x \), finite for every finite value of \( x \), but becoming infinite when \( x \) is infinite; i.e., assuming throughout that the coefficient of \( x^2 \) is \(+1\), then when \( x = \infty \), \( y = + \infty \); but when \( x = - \infty \), \( y = - \infty \) or \( - \infty \), according as \( n \) is even or odd; the curve cuts any line whatever, and in particular it cuts the axis (of \( x \)) in at most \( n \) points; and the value of \( x \), at any point of intersection with the axis, is a root of the equation \( f(x) = 0 \).

If \( \beta \) and \( \alpha \) are any two values of \( x (a > \beta) \), that is, a nearer to \( + \infty \), then if \( f(\beta) \) and \( f(\alpha) \) have opposite signs, the curve cuts the axis an odd number of times, and therefore at least once, between the points \( x = \beta \), \( x = \alpha \); but if \( f(\beta) \) and \( f(\alpha) \) have the same sign, then between these points the curve cuts the axis an even number of times, or it may be not at all. That is, \( f(\beta) \) and \( f(\alpha) \) having opposite signs, there are between the limits \( \beta \), \( \alpha \) an odd number of real roots, and therefore at least one real root; but \( f(\beta) \) and \( f(\alpha) \) having the same sign, there are between these limits an even number of real roots, or it may be there is no real root. In particular, by giving to \( \beta \) and \( \alpha \) the values \( - \infty \), \( + \infty \) (or what is the same thing, any two values sufficiently near to these values respectively) it appears that an equation of an odd order has always an odd number of real roots, and therefore at least one real root; but that an equation of an even order has an even number of real roots, or it may be no real root.

If \( \beta \) be such that for \( x = \beta \) the value of \( f(x) \) is always \(-\), and \( \alpha \) be such that for \( x = \alpha \) the value of \( f(x) \) is always \(+\), then the real roots (if any) lie between these limits \( \beta = \beta \), \( x = \alpha \); and it is easy to find by trial such two limits including between them all the real roots (if any).

3. Suppose that the positive value \( \delta \) is an inferior limit to the difference between two real roots of the equation; or rather (since the foregoing expression would imply the existence of real roots) suppose that there are not two real roots such that their difference taken positively is \( = \delta \); then, \( \gamma \) being any value whatever, there is clearly at most one real root between the limits \( \gamma + \delta \); and by what precedes there is such real root or there is not such real root, according as \( f(\gamma + \delta) \) and \( f(\gamma - \delta) \) have opposite signs or have the same sign. And by dividing in this manner the interval \( \beta \) to into intervals each of which is or \( < \delta \), we should not only ascertain the number of the real roots (if any) but also separate the real roots, that is, find for each of them limits \( \gamma + \delta \); between which there lies one, and only one, real root.

In particular cases it is frequently possible to ascertain the number of the real roots, and to effect their separation by trial or otherwise, when the equation is not too complicated; but the foregoing was the general process as employed by Joseph Louis Lagrange even in the second edition (1808) of the "Tratté de la résolution des équations numériques"; the determination of the limit \( \delta \) had to be effected by means of the "equation of differences" or equation of the order \( \delta(n-1) \), the roots of which are the squares of the differences of the roots of the given equation, and the process is a cumbersome and unsatisfactory one.

4. The great step was effected by the theorem of J. C. F. Sturm (1835)—viz., here starting from the function \( f(x) \), and its first derived function \( f'(x) \), we have (by a process which is a slight modification of that for obtaining the greatest common measure of these two functions) to form a series of functions

\[ f(x), f'(x), f''(x), \ldots \]

of the degrees \( n, n-1, n-2, \ldots \) respectively,—the last term \( f_{n}(x) \) being thus an absolute constant. These lead to the immediate determination of the number of real roots (if any) between any two given limits \( \beta, \alpha \); viz., supposing \( f(\beta) \) and \( f(\alpha) \) of opposite signs (that is, a nearer to \( + \infty \)), then substituting successively these two values in the series of functions, and attending only to the signs of the resulting values, the number of the changes of sign lost in passing from \( f(\beta) \) to \( f(\alpha) \) is the required number of real roots between the two limits. In particular, taking \( \beta = - \infty \), \( \alpha = + \infty \), respectively, the signs of the several functions depend merely on the signs of the values which contain \( x \), and only those are seen by inspection, and the theorem thus gives at once the whole number of real roots.

And although theoretically, in order to complete by a finite number of operations the separation of the real roots, we still need to know the value of the before-mentioned limit \( \delta \); yet in any given case the separation may be effected by a limited number of repetitions of the process. The practical difficulty is when two or more roots are very near to each other. Suppose, for instance, that the theorem shows that there are roots between 0 and 10; by giving to \( x \) the values 1, 2, 3, . . . successively, it might appear that the two roots were between 5 and 6; then again that they were between 5.3 and 5.4, then between 5.34 and 5.35, and so on until we arrive at a separation; say it appears that between 5.34 and 5.34 there is one root, and between 5.345 and 5.346 the other root. But in the case in question \( \delta \) would have a very small value, such as 0.002, and even supposing this value known, the direct application of the first-mentioned process would be still more laborious.

5. Supposing the separation once effected, the determination of the single real root which lies between the two given limits may be effected to any required degree of approximation either by the processes of W. G. Horner and Lagrange (which are in principle a carrying out of the method of Sturm's theorem), or by the process of Sir Isaac Newton, as perfected by Joseph Fourier (which requires to be separately considered).

First as to Horner and Lagrange. We know that between the limits there lies one, and only one, real root of the equation; \( f(\beta) \) and \( f(\alpha) \) having therefore opposite signs. Suppose any intermediate value is \( \theta \); in order to determine by Sturm's theorem whether the root lies between \( \beta \) and \( \theta \), or between \( \theta \) and \( \alpha \), it would be quite unnecessary to calculate the signs of \( f(\beta) \), \( f(\theta) \), \( f(\alpha) \) . . . only the sign of \( f(\theta) \) is required; for, if this has the same sign as \( f(\beta) \), then the root is between \( \beta \) and \( \theta \); if the same sign as \( f(\alpha) \), then the root is between \( \theta \) and \( \alpha \). We want to increase the inferior limit \( \beta \), at which \( f(\beta) \) has the sign of \( f(\theta) \), so long as \( f(\theta) \) retains this sign, and then to a value for which it assumes the opposite sign; we have thus two nearer limits of the required root, and the process may be repeated indefinitely.

Horner's method (1819) gives the root as a decimal, figure by figure; thus if the equation be known to have one real root between 0 and 10, it is in effect shown say that \( 5 \) is too small (that is, the root is between 5 and 6); next that \( 5 \) is too small (that is, the root is between 5.4 and 5.5); and so on to any number of decimals. Each figure is found by the successive trial of all the powers of 10 which precede it, but (as in the ordinary process of the extraction of a square root) which is in fact Horner's process applied to this particular case) it is not presupposed as the first figure of a quotient; such value may be too large, and then the next lower power of 10 is tried instead of it, or it may require to be further diminished. And it is to be remarked that the process not only gives the approximate value of the root, but (as in the extraction of a square root) it includes the calculation of the function \( f(\theta) \), which should be, and is approximately, \( = 0 \). The arrangement of the calculations is very elegant, and forms an integral part of the actual method. It is to be observed that after a certain number of decimal places have been obtained, a good many more can be found by a mere division. It is in the progress tacitly assumed that the roots have been first separated.

Lagrange's method (1767) gives the root as a continued fraction

\[ a \frac{1}{b + \frac{1}{c + \frac{1}{d + \ldots}}} \]

where \( a \) is a positive or negative integer (which may be \( = 0 \)), but \( b, c, \ldots \) are positive integers. Suppose the roots have been separated; then (by trial if need be of consecutive integer values) the limits may be made to be consecutive integer numbers: say they are \( a, a+1 \); the value of \( a \) is therefore \( = a+1/y \), where \( y \) is positive and greater than 1; from the given equation for \( x \), writing therein \( x = a+1/y \), we form an equation of the same order for \( y \), the new equation will thus have no real root greater than \( 1/y \); hence finding for the limits \( b, b+1 \) (where \( b = a \) or \( = a+1 \)), we have \( y = b+1/x \), where \( x \) is positive and greater than \( 1 \); and on that is, we thus obtain the successive denominators \( b, c, d \ldots \) of the continued fraction. The method is theoretically the simplest; but the disadvantage is that it gives the result in the form of a continued fraction, which for the most part must ultimately be converted into a decimal. There is one advantage in the method, that, a commensurable root (that is a root equal to a rational fraction) is found accurately, since, when such root exists, the continued fraction terminates.

6. Newton's method (1711), as perfected by Fourier (1831), may be utilized.
In its original form, the most restricted sense of positive integer number, was extended to have the meaning of a real positive or negative magnitude susceptible of continuous variation. This extension arises out of the theory of equations by a process analogous to that by which number, in its original most restricted sense of positive integer number, was extended to have the meaning of a real positive or negative magnitude susceptible of continuous variation. If for a moment number is understood in its most restricted sense as meaning positive integer number, the solution of a simple equation leads to an extension; \( ax+b=0 \) gives \( x=-b/a \), a positive fraction, and we can in this manner represent, not accurately, but as nearly as we please, any positive magnitude whatever; so an equation \( ax+b=0 \) gives \( x=-b/a \), which (approximately as before) represents any negative magnitude. We thus arrive at the extended signification of number as a continuously varying positive or negative magnitude. Such numbers may be added or subtracted, multiplied or divided one by another, and the result is always a number. Now from a quadratic equation we derive, in like manner, the notion of a complex or imaginary number such as is spoken of above. The equation \( x^2+1=0 \) is (in the foregoing sense, number = real number) satisfied by any numerical value whatever of \( x \); but we assume that there is a number which we call \( i \), satisfying the equation \( i^2+1=0 \), and then taking \( a \) and \( b \) any real numbers, we form an expression such as \( a+bi \), and use the expression \( a+bi \) in this extended sense: any two such numbers may be added or subtracted, multiplied or divided one by the other, and the result is always a number. And if we consider first a quadratic equation \( x^2+px+q=0 \) where \( p \) and \( q \) are real numbers, and next the like equation, where \( p \) and \( q \) are any numbers whatever, it can be shown that there exists for \( x \) a numerical value which satisfies the equation; or, in other words, it can be shown that the equation has a numerical root. The like theorem, in fact, holds good for an equation of any order; but suppose for a moment that this was not the case; say that there was a cubic equation \( x^3+px^2+qx+r=0 \), with numerical coefficients, not satisfied by any numerical value of \( x \), we should have to establish a new imaginary \( j \) satisfying some such equation, and should then have to consider numbers of the form \( a+bj \), or perhaps \( a+bj+cj^2 \) (where \( a, b, c \) are numbers of the kind herefore considered), first we should be thrown back on the quadratic equation \( x^2+px+q=0 \), and \( q \) being now numbers of the last-mentioned extended form non constat that every such equation has a numerical root—and if not, we might be led to other imaginaries \( k, l, \&c. \), and so on ad infinitum in inextricable confusion.

But in fact a numerical equation of any order whatever has always a numerical root, and thus numbers (in the foregoing sense, number = quantity of the form \( a+bi \)) form (what real numbers do not) a universe complete in itself, by which it is clear that they are never led out of it. There may very well be, and perhaps, are, numbers in a more general sense of the term (quaternions are not a case in point, as the ordinary laws of combination are not adhered to), but in order to have to do with such numbers (if any) we must start with them.

8. The capital theorem as regards numerical equations thus is, every numerical equation has a numerical root; or for shortness (the meaning being as before), every equation has a root. Of course the theorem is the reverse of self-evident, and it requires proof; but provisionally assuming it as true, we derive from it the general theory of numerical equations. As the term root was introduced in the course of an explanation, it will be convenient to give here the formal definition.

A number \( a \) such that substituted for \( x \) it makes the function \( x^2+px+q=0 \) to be = 0, or say such that it satisfies the equation \( f(x) = 0 \), is said to be a root of the equation; that is, a being a root, we have

\[
a^2+pa+a^3+\ldots = p_a = 0, \quad \text{or say } f(a) = 0.
\]

And it is then easily shown that \( a \) is a factor of the function \( f(x) \), viz. that we have \( f(a) = (x-a)f(a) \), where \( f(a) \) is a function \( a^2+pa+a^3+\ldots = p_a \) of the order \( a - 1 \), with numerical coefficients, \( q_a, q_{a+1}, \ldots \).

In general \( a \) is not a root of the equation \( f(x) = 0 \), but it may be so. If \( f(x) \) may contain the factor \( (x-a)^2 \); when this is so, \( f(x) \) will contain the factor \( (x-a)^2 \); writing then \( f(x) = (x-a)f(x) \), and assuming that \( a \) is not a root of the equation \( f(x) = 0, x-a \) is then said to

Imaginary Theory.

7. It will be recollected that the expression number and the correlative epithet numerical were at the outset used in a wide sense, as extending to imaginaries. This extension arises out of the theory of equations by a process analogous to that by which number, in its original most restricted sense of positive integer number, was extended to have the meaning of a real positive or negative magnitude susceptible of continuous variation.
be a double root of the equation $f(x) = 0$; and similarly $f(x)$ may contain the factor $(x-a)^2$ and no higher power, and $x=a$ is then a triple root; and so on.

Put $f(x) = (x-a)^n f(z)$ (a being a positive integer which may be equal to, $(x-a)^n$ the highest power of $x-a$ which divides $f(x)$, and $f(z)$ being of the course of the order $n-a$), then the equation $f(x) = 0$ will be different from a $x-b$ will be a factor, in general a simple one, but it may be a multiple one, of $f(z)$, and $f(x)$ will in this case be $f(x) = (x-a)^n f(z) (x-b)$ (a positive integer which may be equal to 1, $(x-b)^{n-b}$ the highest power of $x-b$ in $f(z)$ or $f(x)$, and $f(z)$ being of the course of the order $n-a-b$).

The original equation $f(x) = 0$ is in this case said to have a roots each $= a$, $b$ roots each $= b$, and so on for any other factors $(x-c)^{n-c}$.

We have thus the theorem—A numerical equation of the order $n$ has in every case $n$ roots, viz. there exist $n$ numbers, $a, b, \ldots$ (in general unequal, which may arrange themselves in any sets of equal values), such that $(x-a)(x-b)(x-c)\ldots$ identically.

If the equation has equal roots, these can in general be determined, and the case is at any rate a special one which may be in the first instance excluded from consideration. It is, therefore, in general assumed that the equation $f(x) = 0$ has all its roots unequal.

If the coefficients $p_1, p_2, \ldots$ are all or any one or more of them $0$, then the roots of $f(x) = 0$, where $f(x)$ and $f(z)$ are each of them a function with real coefficients; and it thus appears that the only imaginary coextant numbers are such that not in general any real root $a$, must be at once a root of each of the equations $f(z) = 0$ and $f(x) = 0$.

If the real coefficients may have as well well imaginary as real roots, and we have thus the theorem that for any such equation the imaginary roots enter in pairs, viz. $a+b$ being a root, then $a-b$ will also be a root. It follows that if the order be odd, there is always an odd number of real roots, and therefore at least one real root.

In the case of an equation with real coefficients, the question of the existence of real roots, and of their separation, has been already considered. In the general case of an equation with imaginary (it may be real) coefficients, the like question arises as to the situation of the (real or imaginary) roots; thus, if for facility of conception we regard the constituents $Q$ and $a+b$ as the roots of a point in plane, and accordingly represent the root by such point, then drawing in the plane any closed curve or "contour," the question is how many roots lie within such contour.

This is solved theoretically by means of a theorem of A. L. Cauchy (1837), viz. writing in the original equation $z^{a+b}$ in place of $x$, the function $f(z)$ then becomes $F(z) = 0$, where $F(z)$ and $Q$ are each of them a rational and integral function with real coefficients $(x, y)$ of $x, y$.

Imagining the point $(x, y)$ to travel along the contour, and considering the number of times the function $Q$ is cut by $a+b$ and $a-b$ as the fraction corresponding to passages of the fraction through zero (that is, to values for which $Q(x) = 0$, disregarding those for which $Q(x) = 0$), the difference of these numbers gives the answer to the question of the contour.

It is important to remark that the demonstration does not presuppose the existence of any root; the contour may be the infinity of the plane, or it may have the form of a closed curve, or close curve (in saying closure, and in this case it can be shown (and that very easily) that the difference of the numbers of changes of sign is $n$; that is, there are within the infinite contour, or (what is the same thing) there are in all $n$ roots; thus Cauchy's theorem contains really the proof of the fundamental theorem that a numerical equation of the $n$th order (not only has a numerical root, but) has precisely $n$ roots. It would appear that this proof is the only theorem in its most complete form is in principle identical with the latest proofs of K. F. Gauss (1849) of the theorem, in the form—A numerical equation of the $n$th order has always a root.

But in the case of a finite actual, the actual determination of the difference which gives the number of real roots can be effected only in the case of a rectangular contour, by applying to each of its sides separately a method such as that of Sturm's theorem and thus the actual determination ultimately depends on a method such as that of Sturm's theorem.

Nothing has been done in regard to the calculation of the imaginary roots of an equation by approximation; and the question is not here considered.

10. A class of numerical equations which needs to be considered is that of the binomial equations $x^n - a = 0 (a = a+b, \ldots$ (see Lagrange's Equations numériques).

The foregoing conclusions apply, viz. there are always $n$ roots, which, it may be shown, are all unequal. And these can be found numerically by the extraction of the square root, and of an $n$th root of real numbers, and by the aid of a table of natural sines and cosines. For writing

$$\alpha + bi = \sqrt{(a^2 + b^2)} \cdot \frac{\alpha}{\sqrt{a^2 + b^2}} + \frac{b}{\sqrt{a^2 + b^2}} i,$$

there is always a real angle $\alpha$ (positive and less than $2\pi$), such that its cosine and sine are $\frac{a}{\sqrt{a^2 + b^2}}$ and $\frac{b}{\sqrt{a^2 + b^2}}$ respectively; that is, writing for shortness $\sqrt{(a^2 + b^2)} = r$, we have $\alpha = \beta + \rho (\cos \lambda + i \sin \lambda)$, or the equation $x^n = r (\cos \lambda + i \sin \lambda)$; hence observing that $\cos \lambda + i \sin \lambda$ is a root, a value of $x$ is $\sqrt[n]{r}$.

The formula really gives all the roots, for instead of $x$ we may write $x = \sqrt[n]{\rho (\cos \lambda + i \sin \lambda)}$.

This has the $n$ values obtained by giving to $\lambda$ the values 0, 1, 2, $\ldots$ $n - 1$ in succession; the roots are, it is clear, represented by points lying at equal intervals on a circle. But it is more convenient to proceed somewhat differently; taking one of the roots to be $\theta$, so that $\theta = 0$, then assuming $x = \rho e^{i \theta}$, the equation becomes $x^{n - 1} = 0$, which equation, like the original equation, has precisely $n$ roots (one of them being of course 1).

The original equation $x^n = 0$ is thus reduced to the more simple equation $x^{n - 1} = 0$; and although the theory of this equation is included in the preceding one, yet it is proper to state it separately.

The equation $x^{n - 1} = 0$ has its several roots expressed in the form $\omega, \omega^2, \ldots, \omega^{n - 1}$, where $\omega$ may be taken $= \cos \frac{2\pi}{n} + i \sin \frac{2\pi}{n}$, in fact, $\omega$ having this value, any integer power $\omega^k = \cos \frac{2\pi k}{n} + i \sin \frac{2\pi k}{n}$, and we thence have $(\omega^n) = \cos \frac{2\pi k}{n} + i \sin \frac{2\pi k}{n}$, that is, $\omega^n$ is a root of the equation.

The theorem will be resumed further on.

By what precedes, we are led to the notion (a numerical) of the radical $a^{1/n}$ regarded as an $n$-valued function; any one of these being denoted by $\sqrt[n]{a}$, then the series of values is $\sqrt[n]{a}, \omega \sqrt[n]{a}, \ldots, \omega^{n-1} \sqrt[n]{a}$; we may, if we please, use $\omega$ instead of $\sqrt[n]{a}$ as a symbol to denote the $n$-valued function.

As the coefficients of an algebraical equation may be numerical, all which follows in regard to algebraical equations is (with, it may be, some few modifications) applicable to numerical equations; and hence, concluding for the present this subject, it will be convenient to pass on to algebraical equations.

Algebraical Equations.

11. The equation is

$$x^n - a = 0,$$

and we here assume the existence of roots, viz. we assume that there are $n$ quantities $a, b, c, \ldots$ (in general all of them different, but which in particular cases may become equal in sets in any manner), such that

$$x^n - a = 0,$$

or looking at the question in a different point of view, and starting with the roots $a, b, c, \ldots$ as given, we express the product of the $n$ factors $x-a, x-b, \ldots$ in the foregoing form, and thus arrive at an equation of the order $n$ having the roots $a, b, c, \ldots$ in either case we have

$$p_1 = a, p_2 = ab, \ldots, p_{n-1} = abc \cdots$$

i.e. regarding the coefficients $p_1, p_2, \ldots, p_{n-1}$ as given, then we assume the existence of roots $a, b, c, \ldots$ such that $p_1 = a, \&c.; or, regarding the roots as given, then we write $p_1, p_2, \&c.,$ to denote the functions $2a, 2ab, \&c.$

As already explained, the epithet algebraical is not used in opposition to numerical; an algebraical equation is merely an equation wherein the coefficients are not restricted to denote, or are not explicitly considered as denoting, numbers. That the abstraction is legitimate, appears by the simplest example; in saying that the equation $x^n = \pm q = 0$ has a root $x = \pm \sqrt[q]{\pm (\sqrt[q]{-4q})}$, we mean that the value of the sign for the root is determined by the identity, $[\pm \sqrt[q]{\pm (\sqrt[q]{-4q})} = \pm \sqrt[q]{\pm (\sqrt[q]{-4q})}] + q = 0$; and the verification of this identity in nowise depends upon $q$ and $q$ meaning numbers. But if it be asked what there is beyond numerical equations included in the name algebraical equation, or, again, what is the full extent of the meaning attributed to the term—the latter question at any
rate it would be very difficult to answer; as to the former one, it may be said that the coefficients may, for instance, be symbols of operation. As regards such equations, there is certainly no proof that every equation has a root, or that an equation of the nth order has n roots; nor is it generally true that the precise significance of 0 or 3 of the statement is. But it is found that the assumption of the existence of the n roots can be made without contradictory results: conclusions derived from it, if they involve the roots, rest on the same ground as the original assumption; but the conclusion may be independent of the roots altogether, and in this case it is undoubtedly valid; the reasoning, although actually conducted by aid of the assumption (and, if it may be, most easily and elegantly in this manner), is really independent of the assumption. In illustration, we observe that it is allowable to express a function of p and q as follows,—that is, by means of a rational symmetrical function of a and b, this can, as a fact, be expressed as a rational function of a+b and ab; and if we prescribe that a+b and ab shall then be changed into p and q respectively, we have the required function of p, q. That is, we have P(a, b) as a representation of f(q, p), obtained as if we had p=a+b, q=ab, but without in any wise assuming the existence of the a, b of these equations.

12. Starting from the equation
\[ x^n - px^{n-1} + \ldots = z - a - z + b + \ldots \pm c. \]
or the equivalent equations \( p_1 = \Sigma a, \ldots \), we find
\[ b^n - pb^{n-1} + \ldots = 0, \]
which (it is as satisfying these equations that a, b \ldots are said to be the roots of \( x^n - px^{n-1} + \ldots = 0 \)) and conversely from the last-mentioned equations, assuming that a, b \ldots are all different, we deduce
\[ p_1 = \Sigma a, \quad p_2 = \Sigma ab, \ldots \]
and
\[ x^n - px^{n-1} + \ldots = x - a - x + b + \ldots \pm c. \]
Observe that if, for instance, a=b, then the equations
\[ a^n - pa^{n-1} + \ldots = 0, \quad b^n - pb^{n-1} + \ldots = 0 \]
would reduce themselves to a single relation, which would not of itself express that a was a double root,—that is, that \( (x-a)^n \) was a factor of \( x^n - px^{n-1} + \ldots \); but by considering b as the limit of a+\( h \), \( h \) indefinitely small, we obtain a second equation
\[ x^n - (a-h)^n p^n a^{n-1} + \ldots = 0, \]
which, with the first, expresses that a is a double root; and then the whole system of equations leads as before to the equations
\[ p_1 = \Sigma a, \ldots \]
But the existence of a double root implies a certain relation between the coefficients; the general case is when the roots are all unequal.

We have then the theorem that every rational symmetrical function of the roots is a rational function of the coefficients.

This is an easy consequence from the less general theorem, every rational and integral symmetrical function of the roots is a rational and integral function of the coefficients.

In particular, the sums of the powers \( \Sigma a^2, \Sigma a^3, \ldots \); are rational and integral functions of the coefficients.

The process originally employed for the expression of other functions \( \Sigma a^2, \Sigma a^3, \ldots \), in terms of the coefficients is to make them depend upon the sums of powers: for instance, \( \Sigma a^2 b^2 = \Sigma a^2 \Sigma b^2 = \Sigma a^2 p^2 \); but this is very objectionable; the true theory consists in showing that we have systems of equations
\[ p_1 = \Sigma a, \quad p_2 = \Sigma ab, \quad p_3 = \Sigma a^2 + 3 \Sigma abc, \quad p_4 = \Sigma a^3 + 3 \Sigma a^2 b + 5 \Sigma a b c, \]
where in each system there are precisely as many equations as there are root-functions on the right-hand side,—e.g. 3 equations and 3 functions \( 2abc, \Sigma ab, \Sigma a \). Hence in each case the system of root-functions can be determined linearly in terms of the powers and products of the coefficients:

\[ \Sigma a b = p_2, \quad \Sigma a^2 = p_3 - 2 p_2, \quad \Sigma abc = p_4 - 3 p_2 p_1 + 2 p_3, \quad \Sigma a^3 = p_4 - 3 p_2 p_1 + 2 p_3, \quad \Sigma a^2 b = \frac{1}{2} (p_4 - 2 p_2 p_1 - 3 p_2 p_3 + 2 p_4), \]
and so on. The other process, if applied consistently, would derive the originally assumed value \( p_0 = p_1 \), from the two equations
\[ \Sigma ab + p_3 = \Sigma a^2 p_3 - 2 p_2, \quad i.e. \ we \ have \ \Sigma ab \Sigma a - \Sigma a^3 = p_1 - (p_4 - 2 p_2 p_1 - 3 p_2 p_3 + 2 p_4). \]

13. It is convenient to mention here the theorem that, \( z \) being determined as above by an equation of the order \( n \), any rational and integral function whatever of \( x \), or more generally any rational function which does not become infinite in virtue of its definition itself, can be expressed as a rational and integral function of \( x \), of the order \( n - 1 \), the coefficients being rational functions of the coefficients of the equation. Thus the equation gives \( z \) a function of the form in question; multiplying each side by \( x \), and on the right-hand side writing for \( z \) its foregoing value, we have \( z \) a function of the form in question; and the like for any higher power of \( x \), and therefore also for any rational and integral function of \( x \). In the proof of the case in a rational non-integral function is somewhat more complicated. The final subject of the present section is the form of the functions \( f(x), f(\psi(x)), f(\phi(x)), \ldots \) where \( \phi, \psi \) are rational and integral functions; in other words, this equation, being true if only \( f(x) = 0 \), can only be so by reason that the left-hand side contains \( f(x) \) as a factor, or we must have identically \( f(x) = (\psi(x))^z = (\phi(x))^z \). And it is, moreover, clear that the equation \( f(x) = (\psi(x))^z = (\phi(x))^z \), being satisfied if only \( f(x) = 0 \), must be satisfied by each root of the equation.

From the theorem that a rational symmetrical function of the roots is expressible in terms of the coefficients, it at once follows that it is possible to determine an equation (of an assignable order) having for its roots the several values of any given (unsymmetrical) function of the roots of the given equation. For example, in the case of a cubic equation, roots \( \alpha, \beta, \gamma \) it is possible to have an equation having the roots \( \alpha, \beta, \gamma, \cdots \) (where \( \alpha, \beta, \gamma \) are the roots of the cubic equation) by taking any function \( \phi(x) \) of the cubic equation which is not in the form of differences of a given equation of any order. Again, the equation sought for may be that having for its \( n \) roots the given rational functions \( \phi(a), \phi(b), \cdots \) of the several roots \( a, b, \cdots \) of the given equation; or the given equation \( y^n = \cdots \) (which was shown) be expressed as a rational and integral function of the order \( n - 1 \), and, retaining \( x \) in place of any one of the roots, the problem is to find \( y \) from the equations \( x^n - px^{n-1} + \cdots = 0 \), and \( y = \phi(x) + \cdots \) or, what is the same thing, from these two equations to eliminate \( x \). This is in fact E. W. Tschirnhaus's transformation (1683).

14. In connexion with what precedes, the question arises as to the number of values (obtained by permutations of the roots) of any symmetrical function of the roots of a given set of letters: for instance, with roots or letters \( a, b, c \), etc. if we have, how many values are there of the function \( ab + cd \), or better, how many functions are there of this form? The answer is 3, viz. \( ab + cd, ac + bd, ad + bc \); or again we may ask whether, in the case of a given number of letters, there exist functions with a given number of values, 3-valued, 4-valued functions, etc.

It is at once seen that for any given number of letters there exist 2-valued functions; the product of the differences of the letters in such a function; however the letters are interchanged, it alters only its sign; or say the two values are \( \Delta \) and \( - \Delta \) and if \( P, Q \) are symmetrical functions of the letters, then the general form of such a function is \( P \pm Q \Delta \); this has only the two values \( P + Q \Delta, P - Q \Delta \).

In the case of 4 letters there exist (as appears above) 3-valued functions; but in the case of 5 letters there does not exist any 3- valued function; and the only 4-valued functions are those which are symmetrical in regard to four of the letters, and can thus be expressed in terms of one letter and of symmetrical functions of the other letters. These latter theorems present themselves in the demonstration of the non-existence of a solution of a quintic equation by radicals.

The theory is an extensive and important one, depending on the notions of substitutions and of groups (q.v.).

15. Returning to equations, we have the very important theorem that, given the value of any unsymmetrical function of the roots, e.g. in the case of a quartic equation, the function \( ab + cd \), is in general determined by the value of any similar function, such as \( (a+b)^4 + (c+d)^4 \).

The a priori ground of this theorem may be illustrated by means of a numerical equation. Suppose that the roots of a quartic equation are \( 2, 3, 4, 5 \), then if it is given that \( ab + cd = 14 \), this in effect determines \( a, b \) to be 1, 2 and \( c, d \) to be 3, 4. (viz. \( a = 1, b = 3 \) or \( a = 2, b = 4 \).)
EQUATION

and $c = 1, d = 4$ or $c = 3, d = 4$ or else $a, b$ to be 3, 4 and $d$ to be 1, 2; and it therefore in effect determines $(a+b)^2 + (c+d)^2 = 370$, and the other square that it gives, i.e., having a single value, must be determinable rational. And we can in the same way account for cases of failure as regards particular equations; thus, the roots being $1, 2, 3, 4$ as before, $a^2 + b^2$ determines $a = b = 1$; then $1 + 2 + (4 + 1 + 2)$ does not uniquely determine $a, b$ but only makes them 1,156 and 2,4 respectively.

As to the posteriori proof, assume, for instance,

$$a = 2b, c = a + b, d = a^2 + b^2 - c^2 = -b,$$

then $\gamma, \delta, \alpha, \beta, \gamma + \delta, \gamma + \delta + \alpha, \gamma + \delta + \alpha + \beta, \gamma + \delta + \alpha + \beta + \gamma$ will be respectively symmetrical functions of the roots of the cubic, and therefore rational and integral functions of the coefficients; that is, they will be known.

Suppose for a moment that $a_1, a_2, a_3$ are all known; then the equations being linear in $y_1, y_2, y_3$ these can be expressed rationally in terms of the coefficients and of $a_1, a_2, a_3$; that is, $y_1, y_2, y_3$ will be known. But observe further that $y_4$ is obtained as a function of $a_1, a_2, a_3$; it can therefore be expressed as a rational function of $a_1, a_2, a_3$ in virtue of having a rational function of $a_1$ and of $a_2 + a_3$. Thus $y_4$ is obtained as a rational function of $y_1, y_2, y_3$; but these last are symmetrical functions of the roots, and as such they are expressible rationally in terms of the coefficients; that is, $y_4$ will be expressible as a rational function of $a_1, a_2, a_3$ and of the coefficients, or if $(a_1, a_2, a_3)$ alone are known, $y_4$ will be rationally determined.

16. We now consider the question of the algebraical solution of equations, or, more accurately, that of the solution of equations by radicals.

In the case of a quadratic equation $x^2 - px + q = 0$, we can by the assistance of the sign $\sqrt{(\cdots)}$ or $(\cdots)^{1/2}$ find an expression for $x$ as a 2-valued function of the coefficients $p, q$ such that substituting this value in the equation, the equation is thereby identically satisfied; it has been shown this expression is

$$x = \frac{-p \pm \sqrt{p^2 - 4q}}{2}$$

and the equation is on this account said to be algebraically solvable, or more accurately solvable by radicals. Or we may by writing $x = \frac{-p \pm r}{2}$ reduce the equation to $x^2 - 2rx + s = 0$, viz. to an equation of the 2nd degree in virtue of the 2-valued nature of $r$, and thus reduce the problem that the original equation is solvable by radicals. And the question for an equation of any higher order, say of the order $n$, is, can we by means of radicals (that is, by aid of the sign $\sqrt{(\cdots)}$ or $(\cdots)^{1/n}$, using as many as we please of such signs and with any values of $n$) find an $n$-valued function (or any function) of the coefficients which substituted for $x$ in the equation shall satisfy it identically?

It will be observed that the coefficient $a_1, a_2, a_3, \gamma, \delta$ are not explicitly considered as numbers, but even if they do denote numbers, the question whether a numerical admission of solution by radicals is wholly unconnected with the before-mentioned theorem of the existence of such an admission does not even follow that in the case of a numerical equation solvable by radicals the algebraical solution gives the numerical solution, but this requires especially constructed if $a_1, a_2, a_3$ are a numerical equation with imaginary coefficients. In the formula $x = \frac{-p \pm \sqrt{p^2 - 4q}}{2}$, substituting for $p, q$ their given numerical values, we obtain for $x$ an expression which contains two different values for $x$ when $a \pm b = 0$.

This expression substituted for $x$ in the quadratic equation would satisfy it identically, and it is thus an algebraical solution; but there is no obvious a priori reason why $\sqrt{(\gamma + \delta)}$ should have a value $c + d$, where $c$ and $d$ are real numbers calculable by the extraction of a root or roots of real numbers; however the case is that there was no a priori reason to expect that $\sqrt{(\gamma + \delta)}$ has such a value calculable by means of the radical expressions $\sqrt{\gamma}$, $\sqrt{\delta}$, and the algebraical solution of a numerical quadratic equation does in every case give the numerical solution. The case of a numerical cubic equation will be considered presently.

Taking for greater simplicity the cubic in the reduced form $x^3 + px^2 + qx + r = 0$, and assuming $a + b + c$, this will be a solution if only $3a + b + c, a^2 + b^2 + c^2, a^2 + b^2 + c^2 - r$ is a 2-valued function of the coefficients; combining this with $a + b + c$, we have $a^3 + b^3 + c^3 - 3abc$, a 2-valued function: we then have a by means of a cube root, viz. $a = \sqrt[3]{(b \pm \sqrt{b^2 - r^2})}$, a 6-valued function of the coefficients; but then, writing $g = b/2a$, we have, as may be shown, $a + b$ is a 3-valued function of the coefficients; and $a + b + c$ is the required solution by radicals. It would have been wrong to compute the solutions $b \mp \sqrt[3]{(b \mp \sqrt{b^2 - r^2})}$, for then $a + b$ would have been given as a 9-valued function having only 3 of its 3 roots, and the other 6 values being irrelevant. Observe that in this last process we make no use of the equation $3a + b + c, a^2 + b^2 + c^2, a^2 + b^2 + c^2 - r$ is in its original form, but use only the derived equation $3a^2 + b^2 + c^2 = 3a^2 + b^2 + c^2 - r$.

An interesting variation of the solution is to write $x = a(b + c)$, giving $a^2(b + c) = r$ and $3a = g, or say $a = b + c, a^2 + b^2 + c^2 = q$, and consequently

$$a = \frac{b \mp \sqrt{(b^2 - r^2)}}{2}$$

i.e., here $a^2, b^2$ are each of them a 2-valued function, but as the only effect of altering the sign of the quadratic radical is to interchange $a^2, b^2$, they may be regarded as each of them 1-valued; and $a$ and $b$ are then 3-valued (for observe that here only one value of $a$ is given); and $(a + b + c)$ thus is in appearance a 9-valued function; but it can easily be shown that it is (as it ought to be) only 3-valued.

In the case of a numerical cubic equation the coefficients are real, substituting their values in the expression

$$x = \pm \sqrt[3]{(b \pm \sqrt{b^2 - r^2})}$$

may depend on an expression of the form

$$x = \pm \sqrt[3]{(b \pm \sqrt{b^2 - r^2})}$$

i.e., here $a^2, b^2$ are each of them a 2-valued function, but as the only effect of altering the sign of the quadratic radical is to interchange $a^2, b^2$, they may be regarded as each of them 1-valued; and $a$ and $b$ are then 3-valued (for observe that here only one value of $a$ is given); and $(a + b + c)$ thus is in appearance a 9-valued function; but it can easily be shown that it is (as it ought to be) only 3-valued.

In the case of a numerical cubic equation the coefficients are real, substituting their values in the expression

$$x = \pm \sqrt[3]{(b \pm \sqrt{b^2 - r^2})}$$

this may depend on an expression of the form

$$x = \pm \sqrt[3]{(b \pm \sqrt{b^2 - r^2})}$$

i.e., here $a^2, b^2$ are each of them a 2-valued function, but as the only effect of altering the sign of the quadratic radical is to interchange $a^2, b^2$, they may be regarded as each of them 1-valued; and $a$ and $b$ are then 3-valued (for observe that here only one value of $a$ is given); and $(a + b + c)$ thus is in appearance a 9-valued function; but it can easily be shown that it is (as it ought to be) only 3-valued.

In the case of a numerical cubic equation the coefficients are real, substituting their values in the expression

$$x = \pm \sqrt[3]{(b \pm \sqrt{b^2 - r^2})}$$

this may depend on an expression of the form

$$x = \pm \sqrt[3]{(b \pm \sqrt{b^2 - r^2})}$$

i.e., here $a^2, b^2$ are each of them a 2-valued function, but as the only effect of altering the sign of the quadratic radical is to interchange $a^2, b^2$, they may be regarded as each of them 1-valued; and $a$ and $b$ are then 3-valued (for observe that here only one value of $a$ is given); and $(a + b + c)$ thus is in appearance a 9-valued function; but it can easily be shown that it is (as it ought to be) only 3-valued.

In the case of a numerical cubic equation the coefficients are real, substituting their values in the expression
is a rational function of the coefficients, when these are replaced by their values as functions of the roots becomes, according to the sign given to the quantic radical, \( L^0 \) or \( M^1 \); making it \( L^1 \), the expression has the three values \( L, a, \omega \), and \( \Lambda M \) divided by the same cube root has therefore the values \( M, aM, \omega M \); whence finally the expression
\[
[\Omega + \Omega (L^0 + M^1 + \Omega (L^0 + M^1) + \Omega (L^0 + M^1)]
\]
has the three values
\[
1\{L + \Omega (L + \Omega M)\}, 1\{L + \Omega (L + \Omega M)\}, 1\{L + \Omega (L + \Omega M)\};
\]
that is, there are \( a, b, c \) respectively. If the value \( M^1 \) had been taken instead of \( L^1 \), then the expression would have had the same three values \( a, b, c \). Comparing the solution given for the cubic \( x + ax + a = 0 \), it will readily be seen that the two solutions are identical, and that the function \( r^2 - \omega^2 \theta^2 \) under the radical sign must (by aid of the relation \( \rho = \omega \) which subsists in this case) reduce itself to \( (L^0 - M^1) \); it is only by each radical being equal to a rational function of the roots that the final expression can become equal to the roots \( a, b, c \) respectively.

20. The formulae for the cubic were obtained by J. L. Lagrange (1770-1771) from a different point of view. Upon examining and comparing the principal known methods for the solution of algebraical equations, he found that they all ultimately depended upon finding a "resolvent" equation of which the root is \( \omega + \omega + \omega + \omega \), \( \omega + \omega + \omega + \omega \) of the quintic equation, of the same order as the equation; e.g. for the cubic the root is \( a + ab + ab + \omega \), \( \omega \) an imaginary cubic root of unity. Evidently the method gives for \( L^1 \) a quadric equation, which is the "resolvent" equation in this particular case.

For a quantic the formulae present themselves in a somewhat different form, by reason that \( \omega \) is not a prime number. Attempting to apply it to a quantic, we seek for the equation of which the root is \( a + ab + ab + \omega + \omega + \omega \), \( \omega \) an imaginary quintic root of unity, as the fundamental root of unity, of the same order as the equation; e.g. for the cubic the root is \( a + ab + ab + \omega + \omega + \omega \), \( \omega \) an imaginary quintic root of unity. Evidently the method gives for \( L^1 \) a quantic equation, which is the "resolvent" equation in this particular case.

22. It has already been shown how the roots of the equation \( x^9 - 1 = 0 \) can be expressed in the form \( \cos \frac{2\pi n}{1} + i \sin \frac{2\pi n}{1} \), but the question is now that of the algebraical solution (or solution by radicals) of this equation. There is always a root \( \omega = 1 \); if \( \omega \) be any other root, then obviously \( \omega, \omega^2, \ldots, \omega^{n-1} \) are all of them roots; \( \omega^{n-1} \) contains the factor \( \omega - 1 \), thus it appears that \( \omega, \omega^2, \ldots, \omega^{n-1} \) are the \( n - 1 \) roots of the equation
\[
x^{n-1} + x^{n-2} + \ldots + x + 1 = 0.
\]
It is proper to distinguish these cases as prime and \( n \) composite; and in the latter case there is a distinction according as the prime factors of \( n \) are simple or multiple. By way of illustration, suppose successively \( n = 15 \) and \( n = 19 \); in the former case, if \( \omega \) be an imaginary root of \( (x^2 + x + 1) = 0 \) (or roots of \( x^2 + x + 1 = 0 \)), then \( \omega^2 = \omega \); the successive powers thereof, \( a, \omega^2, \omega^3, \omega^4, \ldots, \omega^{n-1} \), are the roots of the equation \( x^{n-1} + x^{n-2} + \ldots + x + 1 = 0 \); for \( \omega^{n-1} = 1 \); and the solution thus depends on the solution of the equations \( x^2 + x + 1 = 0 \) and \( x^{n-1} + x^{n-2} + \ldots + x + 1 = 0 \). In the latter case, if \( \omega \) be an imaginary root of \( (x^2 + x + 1) = 0 \) (or roots of \( x^2 + x + 1 = 0 \)), then the equation \( x^{n-1} + x^{n-2} + \ldots + x + 1 = 0 \) gives \( \omega, \omega^2, \ldots, \omega^{n-1} \), and \( \omega^{n-1} = 1 \); and it depends on the solution of the equations \( x^2 - x - 1 = 0, \omega^2 - \omega - 1 = 0 \), and \( x^2 - x - 1 = 0 \). The first equation has the roots \( 1, \omega \); if \( \beta \) be a root of either of the others, say \( \beta \omega = 1 \), then assuming \( \omega - 1 \), the successive powers are \( \beta, \beta^2, \beta^3, \ldots, \beta^{n-1} \), \( \beta \cdot \omega^2 = \beta \), \( \beta \cdot \omega = \beta \), \( \beta \cdot \omega^3 = \beta \), \( \beta \cdot \omega^4 = \beta \), \( \beta \cdot \omega^5 = \beta \), \( \beta \cdot \omega^6 = \beta \), \( \beta \cdot \omega^7 = \beta \), \( \beta \cdot \omega^8 = \beta \), \( \beta \cdot \omega^9 = \beta \), \( \beta \cdot \omega^{10} = \beta \), \( \beta \cdot \omega^{11} = \beta \), \( \beta \cdot \omega^{12} = \beta \); and the solution thus depends on the solution of the equations \( x^2 - x - 1 = 0 \), \( \omega^2 - \omega - 1 = 0 \), and \( x^2 - x - 1 = 0 \). It is evident that the only case which need be considered is that of \( n \) a prime number, with \( 1 \). In writing (as in other usual) \( \rho \) in place of \( \omega \), we have \( r, r^2, r^3, \ldots, r^{n-1} \); the \( (n - 1) \) roots of the reduced equation \( x^{n-1} + x^{n-2} + \ldots + x + 1 = 0 \); then not \( r^{n-1} = 1 \), \( r^n = r \); \( \omega = r \).

23. The process of solution due to Karl Friedrich Gauss (1801) depends essentially on the arrangement of the roots in a certain order, viz. not as above, with the indices of \( r \) in arithmetical progression, but with their indices in geometrical progression; the prime number \( n \) has a certain number of prime roots \( g \), which are such that \( g^k \) is the lowest power of \( g \), which is \( 1 \) modulo the modulus \( n \); or, what is the same thing, that the series of powers \( 1, g, g^2, \ldots, g^{n-1} \), each divided by \( n \), leave (in a different order) the remainders \( r, r^2, \ldots, r^{n-1} \) in the \( (n - 1) \) roots of the reduced equation \( x^{n-1} + x^{n-2} + \ldots + x + 1 = 0 \); which are the roots of the equation \( x^n - 1 = 0 \), and \( \omega^{n-1} = 1 \); the mode of division is more easily seen for a larger number of \( n \), and \( n = 7 \) a prime root of
\[
x^7 + x^6 + x^5 + x^4 + x^3 + x^2 + x + 1 = 0.
\]
and the arrangement of the roots is \( r, r^2, r^3, r^4, r^5, r^6, r^7 \). The roots may form either 3 periods of each 2 terms, \( P, P, r^2, r^4, r^6, r^8, r^10 \); or else 2 periods of each 3 terms, \( P, P, r^2, r^4, r^6, r^8, r^10 \). The theory was further developed by Lagrange (1808), who, applying his general process to the equation in question, \( x^{n-1} + x^{n-2} + \ldots + x + 1 = 0 \), by taking the roots of the indices in geometrical progression as above, showed that the function \( (x - a) + (x - b) + \ldots + (x - n) \) was in this case a given function of \( x \) with integer coefficients.

Reverting to the before-mentioned particular equation \( x^{n-1} + x^{n-2} + \ldots + x + 1 = 0 \), it is very interesting to compare the process of solution by radicals here for the solution of the general quartic the roots whereof are \( a, b, c, d \), the developed value of this
\[
(a + b + c + d)(a + b + c + d) + (a + b + c + d)(a + b + c + d) + (a + b + c + d)(a + b + c + d) + (a + b + c + d)(a + b + c + d)
\]
with a, b, c, d. Take \( \omega \) a root of the equation \( (x - a) + (x - b) + \ldots + (x - n) \) (whence \( \omega = 1, -1, i, \) or \(-i, \) at pleasure), and consider the expression
\[
(a + b + c + d)(a + b + c + d) + (a + b + c + d)(a + b + c + d) + (a + b + c + d)(a + b + c + d) + (a + b + c + d)(a + b + c + d)
\]
is a given function \( M_4 + M_6 \omega = M_4 \omega + \omega M_6 \), with integer coefficients, and by the extraction of \((n-1)th\) roots of this and similar expressions we ultimately obtain \( r \) in terms of \( \omega \), which is taken to be known; the equation \( x^n - 1 = 0 \), a prime number, is thus solvable by radicals. In particular, if \( n = 2 \), the equation \( x^2 - 1 = 0 \) is the simplest example of an equation solvable by radicals, considered by N. H. Abel (1828), and which called Abelian equations, viz. for the Abelian equation of the order \( n \), if \( x \) be any root, the roots are \( x, \beta x, \beta^2 x, \ldots, \beta^{n-1} x \) being a rational function of \( x \), and \( \beta = e^{2\pi i/n} \); the theory is, in fact, very analogous to that of the above particular case.

A more general theorem obtained by Abel is as follows:—If the roots of an equation of any order are connected together in such wise that all the roots can be expressed rationally in terms of any one of them, say \( z \); if, moreover, \( \beta = e^{2\pi i/n} \) being any two of the roots, we have \( \beta x = 2x \), the equation will be solvable algebraically. It is proper to refer also to Abel's definition of an irreducible equation:—an equation \( ax^n + \ldots + a_0 = 0 \), the coefficients of which are not rational functions of a certain number of known quantities \( a, b, c, \ldots \), is called irreducible when it is impossible to express its roots by an equation of an inferior degree. Abel said that a quintic equation is irreducible if its coefficients are not rational functions of \( a, b, c, \ldots \) (or, what is the same thing, when \( a, b, c, \ldots \) does not break up into factors which are rational functions of \( a, b, c, \ldots \)). Abel applied his theory to the equation \( x^n + 1 = 0 \), the roots of which are in the division of the elliptic functions, but not to the modular equations.

24. But the theory of the algebraic solution of equations in its most complete form was established by Evariste Galois (born October 1811, killed in a duel May 1832; see his collected works, *Liouv. t. xii.*). The definition of an irreducible equation resembles Abel's—an equation is reducible when it admits of a rational divisor, irreducible in the contrary case; only the word *rational* is used in this extended sense that, in connection with the coefficients of the given equation, or with the irrational quantities (if any) whereof these are composed, he considers any number of other irrational quantities called *adjoint radicals,* and he terms rational any rational function of the coefficients (or the irrationals whereof they are composed) and of these adjoint radicals; the epiphir irreducible is thus taken either absolutely or in a relative sense, according to the system of adjoint radicals which are taken into account. For instance, the equation \( x^4 + x^3 + x^2 + x + 1 = 0 \); the left hand side has no rational divisor, and the equation is irreducible; but this function is \( (x^2 + x + 1)^2 - 2x \), and \( x^2 + x + 1 \) is thus the rational division \((x^2 + x + 1) \mid (x^4 + x^3 + x^2 + x + 1); \) and these, we adjoin the radical \( \sqrt{5} \), are rational, and the equation is no longer irreducible. In the case of a given equation, assumed to be irreducible, the problem to solve the equation is, in fact, that of finding radicals by the adjunction of which the equation becomes reducible; for instance, the general quadratic equation \( x^2 + px + q = 0 \) is irreducible, but it becomes reducible, breaking up into rational linear factors, when we adjoin the radical \( \sqrt{p^2 - 4q} \).

The fundamental theorem I. of the Preparatory Memoire on the conditions de résolubilité des équations par radicaux*; viz. given an equation of which \( a, b, c, \ldots \) are the \( m \) roots, there is always a group of permutations of the letters \( a, b, c, \ldots \) possessed of the following properties:

1. Every function of the roots invariant by the substitutions of the group is rationally known.

2. Reciprocally every rationally determinable function of the roots is rationally known by the substitutions of the group.

Here by an invariant function is meant not only a function of what is called a complete form is invariant by the substitutions of the group, but further, one of which the value is rationally known by the substitutions: for instance, if the equation be \( \phi (x) = 0 \), then \( \phi (x) \) is a function of the roots invariant by any substitution whatever. And in saying that \( \phi (x) \) is rationally determined we mean rationally in terms of the coefficients and of the adjoint quantities.

For instance in the case of a general equation, the group is simply the system of the \( 1,2,3 \ldots \) permutations of all the roots, since in this case, the only rationally determinable functions are the symmetric functions of the roots.

In the case of the equation \( x^n + \ldots + x + 1 = 0 \) a prime number, \( a, b, c, \ldots \) are a group which is not a permutation group of the roots, but is a group of the cyclic group, \( \{a, b, c, \ldots \} \cdot \{c, b, a, \ldots \} \cdot \{b, c, a, \ldots \} \cdot \{a, b, c, \ldots \} \cdot \ldots \) which appears as the first link of a long chain of questions relating to the transformation and classification of irrationals.

25. Returning to quintic equations, George Birch Jerrard (1835) established the theorem that the general quintic equation is by the extraction of only square and cubic roots reducible to the form \( x^2 + ax + b = 0 \), or what is the same thing, to \( x^2 + bx + c = 0 \). The actual reduction by means of Tschirnhausen's theorem was effected by Charles Hermite in connexion with his elliptic-function solution of the quintic equation (1859) in a very elegant manner. It was shown by Sir James Cockle and Robert Harley (1858–1859) in connexion with the Jerrardian form, and by Arthur Cayley (1861), that Lagrange's resolvent equation of the sixth order can be replaced by a more simple sextic equation connected with a like place of the original equation. The theory of the modular equations, more particularly for the case \( n = 5 \), has been studied by C. Hermite, L. Kronecker and F. Briotchi. In the case \( n = 5 \), the modular equation of the order 6...
EQUATION OF THE CENTRE—EQUIDAE

depends, as already mentioned, on an equation of the order 5; and conversely the general quintic equation may be made to depend upon this modular equation of the order 6; that is, assuming the solution of this modular equation, we can solve (not by radicals) the general quintic equation; this is Hermite's solution of the general quintic equation by elliptic functions (1858); it is analogous to the before-mentioned trigonometrical solution of the cubic equation. The theory is reproduced and developed in Brioscii's memoir, "Über die Auflösung der Gleichungen vom fünften Grade," Math. Annalen, t. xiii. (1878—1879).

26. The modern work, reproducing the theories of Galois, and exhibiting the theory of algebraic equations as a whole, is C. Jordan's "Théorie des substitutions et des équations algébriques" (Paris, 1870). It is divided into two books, book i. relating to the theory of congruences; book ii. in two chapters, the first relating to substitutions in general, the second to substitutions defined analytically, and chiefly to linear substitutions; book iii. has four chapters, the first discussing the principles of the general theory, the other three containing applications to algebra, geometry, and the theory of transcendents; lastly, book iv., divided into seven chapters, contains a determination of the general forms of equations solvable by radicals, and a complete system of classification of these types. A glance through the index will show the vast extent which the theory has assumed, and the forms of general conclusions arrived at; thus, in book iii., the algebraical applications comprise Abelian equations, equations of Galois; the geometrical ones comprise Q. Hesse's equation, R. F. A. Clebsch's equations, lines on a quartic surface having a rational line, singular points of E. E. Kummer's surface, lines on a cubic surface, problems of contact; the applications to the theory of transcendents comprise circular functions, elliptic functions, including divisors of the modular functions, hyperelliptic functions, solution of equations by transcendents. And on this last subject, solution of equations by transcendents, we may quote the result—"the solution of the general equation of an order greater than five cannot be made to depend upon the equations for the division of the circular or elliptic functions"; and again (but with a reference to a possible case of exception), "the general equation cannot be solved by means of the quotient and the division of the hyperelliptic functions into an odd number of parts." (See also GROUPS, THEORY OF.)

27. For the genealogy of the family see W. S. Burnside and A. W. Panton, The Theory of Equations (4th ed., 1899—1901); the Galoisian theory is treated in G. B. Matthews, Algebraic Equations (1907). See also the Encyc. d. math. Wisz. vol. ii.

EQUATION OF THE CENTRE, in astronomy, the angular distance, measured around the centre of motion, by which a planet moving in an ellipse deviates from the mean position which it would occupy if it had moved uniformly. Its amount is the correction which must be applied positively or negatively to the mean anomaly in order to obtain the true anomaly. It arises from the ellipticity of the orbit, is zero at pericentre and apocentre, and reaches its greatest amount nearly midway between these points. (See ANOMALY AND ORBIT.)

EQUATION OF TIME, the difference between apparent time, determined by the meridian passage of the real sun, and mean time, determined by the passage of the mean sun. It goes through a double period in the course of a year. Its amount varies a fraction of a minute for the same date, from year to year and from one longitude to another, on the same day. The following table shows an average value for any date and for the Greenwich meridian for a number of years, from which the actual value will seldom deviate more than 20 seconds until after 1950. The + sign indicates that the real sun reaches the meridian after mean noon; the - sign before mean noon.

EQUATOR (Late Lat. aequator, from aequare, to make equal), in geography, that great circle of the earth, equidistant from the two poles, which divides the northern from the southern hemisphere and lies in a plane perpendicular to the axis of the earth; this is termed the "geographical" or "terrestrial equator." In astronomy, the "celestial equator" is the name given to the great circle in which the plane of the terrestrial equator intersects the celestial sphere; it is consequently equidistant from the celestial poles. The "magnetic equator" is an imaginary line encircling the earth, along which the vertical component of the earth's magnetic force is zero; it nearly coincides with the terrestrial equator.

EQUIBRY (from the Fr. équire, a stable, through its older form descevir from the Lat. secare, to cut, or to divide; secare, a word of Teutonic origin for a stable or shed, cf. Ger. Scheuer; the modern spelling has confused the word with the Lat. equus, a horse), a contracted form of "gentleman of the equerry," an officer in charge of the stables of a royal household. At the British court, equerries are officers attached to the department of the master of the horse, the first of whom is called chief equerry (see HOUSEHOLD, ROYAL).

EQUIDAE, the family of perissodactyle ungulate mammals typified by the horse (Equus caballus); see Horse. According to the older classifications this family was taken to include only the forms with tall-crowned teeth, more or less closely allied to the typical genus Equus. There is, however, such an almost complete graduation from the former to earlier and more primitive mammals with short-crowned cheek-teeth, at one time included in the family Lophiodontidae (see PERISSODACTYLA), that it has now become a very general practice to include the whole "pliomy" in the family Equidae. The Equidae, in this extended sense, together with the extinct Palaeoatheridae, are indeed now regarded as forming one of four major groups into which the Perissodactyla are divided, the other groups being the Tapiridea, Rhinocerotidea and Titanotheridea. For the horse-group the name Hippoidea is employed. All four groups were closely connected in the Lower Eocene, so that exact definition is almost impossible.

In the Hippoidea there is generally the full series of 44 teeth, but the first premolar is often deciduous or wanting in the lower or in both jaws. The incisors are chisel-shaped, and the canines tend to become isolated so as in the now specialized forms to occupy nearly the middle of a longer or shorter gap between the incisors and premolars. In the upper molars the two outer columns of the primitive tubercular molar coalesce to form an outer wall, from which proceed two crescentic transverse crests; the connexion between the crests and the wall being imperfect or slight, and the crests themselves sometimes tubercular. Each of the lower molars carries two crescentic ridges. The two rows of toes range from four to one in the fore-foot, and from three to one in the hind-foot. The paroccipital, postgonal and post-tympanic processes of the skull are large, and the latter always distinct. Normally there are no traces of horn-cores. The calcaneum lacks the facet for the fibula found in the Titanotheridea.

In the earlier Equidae the teeth were short-crowned, with the premolars simpler than the molars; but there is a gradual tendency to an increase in the height of the crowns of the teeth, accompanied by increasing complexity of structure and the filling up of the hollows with cement. Similarly the gap on each side of the canine tooth in each jaw continues to increase.
length; while in all the later forms the orbit is surrounded by a ring of bone. A third modification is the increasing length of limb (as well as in general bodily size), accompanied by a gradual reduction in the number of toes from three or four to one.

All the existing members of the family, such as the domesticated horse (Equus caballus) and its wild or half-wild relatives, the asses and the zebras, are included in the typical genus. In all these the crowns of the cheek-teeth are very tall (fig. 1, b) and only develop roots late in life; while their grinding-surfaces (fig. 2, b and c) are very complicated and have all the hollows filled with cement. The summits of the incisors are infolded, producing, when partially worn, the "mark." In the skull the orbit is surrounded by bone, and there is no distinct depression in front of the same. Each limb terminates in one large toe; the lateral digits being represented by the splint-bones, corresponding to the lateral metacarpals and metatarsals of *Hippocampus*. Not unfrequently, however, the lower ends of the splint-bones carry a small expansion, representing the phalanges.

Remains of horses indistinguishable from *E. caballus* occur in the Pleistocene deposits of Europe and Asia; and it is from them that the dun-coloured small horses of northern Europe and Asia are probably derived. The ancestor of these Pleistocene horses is probably *E. stenonis*, of the Upper Pliocene of Europe, which has a small depression in front of the orbit, while the skull is relatively larger, the feet are rather shorter, and the splint-bones somewhat more developed. In India a nearly allied species (*E. sivolitensis*), occurs in the Lower Pliocene, and may have been the ancestor of the Arab stock, which shows traces of the depression in front of the orbit characteristic of the earlier forms. In North America species of *Equus* occur in the Pleistocene and from that continent others reached South America during the same epoch. In the latter country occurs *Hippidium*, in which the cheek-teeth are shorter and simpler, and the nasal bones very long and slender, with elongated slits at the side. The limbs, especially the cannon-bones, are relatively short, and the splint-bones large. The allied Argentine *Onchippidium*, which is also Pleistocene, has still longer nasal bones and slits, and a deep double cavity in front of the orbit, part of which probably contained a gland. *Onchippidium* is certainly off the direct line of descent of the modern horses, and, on account of the length of the nasals and their slits, the same probably holds good for *Hippidium*.

Species from the Pliocene of Texas and the Upper Miocene (Loup Fork) of Oregon were at one time assigned to *Hippidium*, but this is incorrect, that genus being exclusively South American. The name *Plionippus* has been applied to species from the same two formations on the supposition that the foot-structure was similar to that of *Hippidium*, but Mr. J. W. Gidley is of opinion that the lateral digits may have been fully developed.

Apparently there is here some gap in the line of descent of the horse, and it may be suggested that the evolution took place, not as commonly supposed, in North America, but in eastern central Asia, of which the palaeontology is practically unknown; some support is given to this theory by the fact that the earliest species with which we are acquainted occur in northern India.

Be this as it may, the next North American representatives of the family constitute the genera *Prohippus* and *Merychippus* of the Miocene, both of which the lateral digits are fully developed and terminate in small though perfect hoofs. In both the cheek-teeth have moderately tall crowns, and in the first named of the two those of the milk-series are nearly similar to their permanent successors. In *Merychippus*, on the other hand, the milk-molars have short crowns, without any cement in the hollows, thus resembling the permanent molars of the under-mentioned genus *Anchitherium*. From the well-known *Hipparion*, or *Hipposiderium*, typically from the Lower Pliocene of Europe, but also occurring in the corresponding formation in North Africa, Persia, India and China, and represented in the Upper Miocene Loup Fork beds of the United States by species which it has been proposed to separate generically as *Neo-

![Diagram](https://example.com/diagram.png)

**Fig. 1.**—a, Side view of second upper molar tooth of *Anchitherium* (brachydont form); b, corresponding tooth of horse (hypodont form).

**Fig. 2.**—a, Grinding surface of unworn right upper molar tooth of *Anchitherium*; b, corresponding surface of unworn molar of young horse; c, the same tooth after it has been some time in use. The uncoloured portions are the dentine or ivory, the shaded parts the cement filling the cavities and surrounding the exterior. The black line separating these two structures is the enamel or hardest constituent of the tooth.

the outermost incisor is short, the bones of the middle part of the leg are separate, and there are at least three toes to each foot.

The longest-known genus and the one containing the largest species is Anchithium, typically from the Middle Miocene of Europe, but also represented by one species from the Upper Miocene of North America. The European A. aurelianense was of the size of an ordinary donkey. The cheek-teeth are of the usual kind of figs. b. and 2. is the premolar, with the exception of the small first one, being molar-like; and the lateral toes (fig. 3, c) were to some extent functional. The summits of the incisors were infolded to a small extent. Nearly allied is the American Moschippus, ranging from the Lower Miocene to the Lower Oligocene of the United States, of which the earliest species stood only about 18 in. at the shoulder. The incisors were scarcely, if at all, infolded, and there is a rudiment of the fifth metacarpal (fig. 3, b). By some writers all the species of Moschippus are included in the genus Micropus, but others consider that the two genera are distinct.

Moschippus and Micropus are connected with the earliest and most primitive mammal which it is possible to connect in the family Equidae by means of Epiphippus of the Uinta or Upper Eocene of North America, and Pachynolophus, or Orchipus, of the Middle and Lower Eocene of both halves of the northern hemisphere. The graal stage, or rather the initial stage, in the sense is presented by Hyracotherium (Protorhipus), a mammal no larger than a fox, common to the Lower Eocene of Europe and North America. The general characteristics of this progenitor of the horses are those given above as distinctive of the group. The cheek-teeth are, however, much simpler than those of Anchithium; the transverse crests of the upper molars not being fully connected with the outer wall, while the premolars in the upper jaw are triangular, and thus unlike the molars.

The incisors are small and the canines scarcely enlarged; the latter having a gap on each side in the lower, but only one on their hinder aspect in the upper jaw. The fore-feet have four complete toes (fig. 3, a), but there are only three hind-toes, with a rudiment of the fifth metatarsal. The vertebrae are simpler in structure than in Equus. From Hyracotherium, which is closely related to the Eocene representatives of the ancestral stocks of the other three branches of the Perissodactyla, the transition is easy to Phenacodus, the representative of the common ancestor of all the Ungulata.

EQUILIBRIUM (from the Lat. aequus, equal, and libera, a balance), a condition of equal balance between opposite or counteracting forces. By the "sense of equilibrium" is meant the sense, or sensations, by which we have an appreciation of the position and movement of the body, as well as the stability, or the ability of the body to stand erect, or to maintain the balance in standing, walking, and indeed in all the movements by which the body is carried through space. Such a feeling of security is necessary both for maintaining any posture, such as standing, or for performing any movement. If this feeling is absent or uncertain, or if there are contradictory sensations, then definite muscular movements are inefficient or irregularly performed, and the body may stagger or fall. When we stand erect on a firm surface, like a floor, there is a feeling of resistance, due to the muscles pressing the brain from the soles of the feet and from the muscles of the limbs and trunk. In walking or running, these feelings of resistance seem to precede and guide the muscular movements necessary for the next step. If these are absent or perverted or deficient, as is the case in the disease known as locomotor ataxia, then, although there is no loss of the power of voluntary movement, the patient staggers in walking, especially if he is not allowed to look at his feet, or if he is induced to fold his eyes, as in a darkened room. The patient feels an apperception of position or distance, and then the sense or perception of the limits that come from the limbs; and with a feeling that he is walking on a soft substance, offering little or no resistance, he staggers, and his muscular movements become irregular. Such a condition may be artificially brought about by washing the soles of the feet with chloriform or ether. And it has been observed to exist partially after extensive destruction of the skin of the soles of the feet by burns or scalds. This shows that tactile impulses from the skin take a share in generating the guiding sensation. In the disease above mentioned, however, tactile impressions may be nearly normal, but the guiding sensation is weak and inefficient, owing to the absence of impulses from the muscles. The disease is known to depend on morbid changes in the posterior columns of the spinal cord, by which impulses are not freely transmitted upwards to the brain. These facts point to the existence of muscular impulses coming from the muscles and tendons. It is now known that there exist peculiar spindles, in muscle, and rosettes or coils or loops of nerve fibres in close proximity to tendons. These are the end organs of the sense. The transmission of impulses gives rise to the muscular sense, and the guiding sensation which precedes co-ordinated muscular movements depends on these impulses. Thus from the limbs streams of nervous impulses pass to the sensorium from the skin and from muscles and tendons; these may or may not arouse consciousness, but they guide or evoke muscular movements of a co-ordinated character, more especially of the limbs.

In animals whose limbs are not adapted for delicate touch nor for the performance of complicated movements, such as some mammals and birds and fishes, the guiding sensations depend largely on the sense of vision. This sense in man, instead of assisting the guiding sensation, it is true, that in locomotor ataxia visual sensations may take the place of the tactile and muscular sensations that are inefficient; and the men can walk without staggering if he is allowed to look at the floor, and especially if he is guided by transverse straight lines. On the other hand, the acrobat on the wire-robe dare not trust his visual sensations in the maintenance of his equilibrium. He keeps his eyes fixed on one point instead of allowing them to wander to objects below him, and his muscular movements are regulated by the impulses that come from the skin and muscles of his limbs. The feeling of insecurity probably arises from a conception of height, and also from the knowledge that no muscular movements can a man avoid a catastrophe if he should fall. A bird, on the other hand, depends largely on visual impressions, and it knows by experience that if launched into the air from a height it can fly. Here, probably, is an explanation of the large size of the eyes of birds. Cover the head, as in hooding a falcon, and the bird seems to be deprived of the power of voluntary movement. Little effect will be produced if we attempt to restrain the movements of a cat by covering its eyes. A fish also is deprived of the power of motion if its eyes are covered. But both in the bird and in the fish tactile and muscular impressions, especially the latter, come into play in the mechanism of equilibrium. In flight the large-winged birds, especially in soaring, can feel the most delicate wind-pressures, both as regards direction and force, and they can keep the body so as to catch the pressure at the most efficient angle. The same is true of the fish, especially of the flat-fishes. In mammals the sense of equilibrium depends, then, on streams of tactile, muscular and visual impressions pouring in on the sensorium, and calling forth appropriate muscular movements. It has also been noted that impulses coming from the abdominal viscera may take part in the mechanism. The presence in birds of a sensory apparatus of felines (cats, &c.) of large numbers of Pacinian corpuscles, which are believed to be modified tactile bodies, favours this supposition. Such animals are remarkable for the delicacy of such muscular movements, as balancing and leaping.

There is another channel by which nervous impulses reach the sensorium and play their part in the sense of equilibrium, namely, from the semicircular canals, a portion of the internal ear. It is pointed out in the article Hearing that the appreciation of sound rests on the superiority of forms, and the variations of pressure. The labyrinth consists of the vestibule, the cochlea and the semicircular canals. The cochlea receives the sound-waves (variations of pressure) that constitute musical tones. This it accomplishes by the structures in the ductus cochlearis. In the vestibule we find two sacs, the saccule next to and communicating with the ductus cochlearis, and the utricle communicating with the semicircular canals. The base of the stapes communicates
pressures to the utricle. The membranous portion of the semi-
circular canals consists of a tube, dilated at one end into a
swelling or pouch, termed the ampulla, and each end com-
municates freely with the utricle. On the posterior wall of both
the saccule and of the utricle there is a ridge, termed in each case
the macula acustica, bearing a highly specialized epithelium.
A similar structure exists in each ampulla. This would suggest
that all three structures have to do with hearing; but, on the
other hand, there is experimental evidence that the utricle
and the canals may transmit impressions that have to do with
equilibrium. Pressure of the base of the stapes is exerted on
the utricle wall, which compresses the fluid in that cavity, and
the endolymph is forced to drive the fluid into the semicircular canals that communicate
with that cavity by five openings. Each canal is surrounded
by a thin layer of perilymph, so that it may yield a little to this
pressure, and exert a pull or pressure on the nerve-endings in
each ampulla. Thus impulses may be generated in the nerves of the
ampullae.

The three semicircular canals lie in the three directions in
space, and it has been suggested that they have to do with our
appreciation of the direction of sound. But our appreciation of
sound is very inaccurate: we look with the eyes for the source
of a sound, and instinctively direct the ears or the head, or both,
in the direction from which the sound appears to proceed. But
the relationship of the canals on the two sides must have a
physiological significance. Thus (1) the six canals are parallel,
two and two; or (2) the two horizontal canals are in the same
plane, while the superior canal on one side is nearly parallel with
the posterior canal of the other side. These facts point to the two
sets of canals and ampullae acting as one organ, in a manner
analogous to the action of two retinae for single vision.

We have next to consider how the canals may possibly act in
connexion with the sense of equilibrium. In 1820 J. Purkinje
studied the vertigo that follows rapid rotation of the body in the
eject position on a vertical axis. On stopping the rotation there
is a sense of rotation in the opposite direction, and this may occur
even when the eyes are closed. Purkinje noticed that the position of the imaginary axis of rotation depends on the axis
around which the head revolves. In 1828 M. J. P. Flourens
discovered that injury to the canals causes disturbance to the
equilibrium and loss of co-ordination, and that sections of the
canals produce a rotatory movement of a kind corresponding to
the canal that had been divided. Thus division of a mem-
branous canal causes rotatory movements round an axis at right
angles to the plane of the divided canal. The body of the animal
always moves in the direction of the cut canal. Many other
observers have corroborated these experiments. F. Goltz was
the first who formulated the conditions necessary for equilibra-
tion. He put the matter thus:—(1) A central co-ordinating
organ—in the brain; (2) centripetal fibres, with their peripheral
terminations—in the ampullae; and (3) centrifugal fibres, with
their terminal organs—in the muscular mechanisms. A lesion of
any one of these portions of the mechanism causes loss or im-
pairment of balancing. Cyan also investigated the subject, and
concluded:—(1) To maintain equilibrium, we must have an
accurate notion of the position of the head in space; (2) the
function of the semicircular canals is to communicate impressions that give a representation of this position—each canal having a
relation to one of the dimensions of space; (3) disturbance of
equilibrium follows section; (4) involuntary movements follow-
ing section are due to abnormal excitations; (5) abnormal
movements occurring a few days after the operation are caused by
irritation of the cerebellum.

On theoretical considerations of a physical character, E. Mach,
Crum-Brown and Breuer have advanced theories based on the
idea of the canals being organs for sensations of acceleration
of movement, or for the sense of rotation. Mach first pointed out
that Purkinje’s phenomena, already alluded to, were in all
probability related to the semicircular canals. He showed that
if the subject is rotated round a vertical axis, he is not conscious of the velocity of motion, but of variations in this
velocity. Similarly, if a body is rotated round a vertical axis,
we perceive only angular acceleration and not angular velocity.
The sensations produced by angular acceleration last longer
than the acceleration itself, and the position of the head during
the movements enables us to determine direction.” Both Mach
and Goltz state that varying pressures of the fluid in the canals produced by angular rotation produce sensations of movement
(always in a direction opposite to the rotation of the body),
and that these, in turn, cause the vertigo of Purkinje and the
phenomena of Flourens. Mach, Crum-Brown and Breuer ad-
vance hydrodynamical theories in which they assume that the
fluids move in the canals. Goltz, on the other hand, supports a
sun rotation hypothesis. In this hypothesis the canals can be
accounted for by varying pressures. Crum-Brown differs
from Mach and Breuer as follows:—(1) In attributing movement or variation of pressure not merely to the endolymph, but also to
the walls of the membranous canals and to the surrounding
perilymph; and (2) in regarding the two labyrinths as one
organ, all the six canals being required to form a true conception of
the rotating motion of the head. He sums up the matter
thus: “We have two ways in which a relative motion can occur
between the endolymph and the walls of the cavity containing
it—(1) When the head begins to move, here the walls leave
the fluid behind; (2) when the head stops, here the fluid flows
on. In both cases the sensation of rotation is felt. In the first
this sensation corresponds to a real rotation, in the second it does not, but in both it corresponds to a real acceleration (positive
or negative) of rotation, using the word acceleration in its
technical kinematical sense.”

Mach states that the semicircular canals only indirectly assist
in giving a notion of spatial relations. “He holds that knowledge
of the position of bodies in space depends on nervous impulses
coming from the contracting ocular muscles; that the oculor
motor centres are in intimate physiological relationship with the
centres receiving impulses from the nerves of the semicircular
canals; and that the oculomotor centres, thus excited, produce
the movements of the eyeballs, which then determine our notions of
spatial relations.” These views are supported by experiments of
Lee on dog-fish. When the fish is rotated round different
axes there are compensating movements of the eyes and fins.
“It was observed that if the fish were rotated in the plane of
one of the canals, exactly the same movements of the eyes and
fins occurred as were produced by experimental operation and
stimulation of the ampulla of that canal.” Sewall, in 1853, carried
out experiments on young sharks and skates with negative
results. Lee returned to the subject in 1894, and, after numerous
experiments on dog-fish, in which the canals or the auditory
nerve were divided, obtained evidence that the ampullae con-
tain sense-organs connected with the sense of equilibrium.
It has been found by physicians and aurists that disease or
injury of the canals, occurring rapidly, produces giddiness,
staggering, nystagmus (a peculiar twitching movement of the
muscles of the eyeballs), vomiting, noises in the ear and more or
less deafness. It is said, however, that if pathological changes
come on slowly, so that the canals and vestibule are converted
into a solid mass, none of these symptoms may occur. On
the whole, the evidence is in favour of the view that from the semi-
circular canals nervous impulses are transmitted, which, co-
norated with impulses coming from the visual organs, from the
muscles and from the skin, form the bases of these guiding
sensations on which the sense of equilibrium depends. These
impulses may not reach the level of consciousness, but they
call into action co-ordinated mechanisms by which complicated
muscular movements are effected.

Full bibliographical references are given in the article on “The
Ear” by J. G. McKendrick, in Schäfer’s Textbook of Physiolo-
two such points, oppose each other, at one of which the sun crosses the equator toward the north and at the other toward the south. They are called vernal and autumnal respectively, from the relation of the corresponding times to the seasons of the northern hemisphere. The line of the equinaxes is the imaginary diameter of the celestial sphere which joins them.

The vernal equinox is the initial point from which the right ascensions and the longitudes of the heavenly bodies are measured (see ASTRONOMY: Spherical). It is affected by the motions of Precession and Nutation, of which the former has been known since the time of Hipparchus. The actual equinox is defined by first taking the conception of a fictitious point called the Mean Equinox, which moves at a nearly uniform rate, slow varying, however, from century to century. The true equinox then moves around the mean equinox in a period equal to that of the moon’s nodes. These two motions are defined with greater detail in the articles PRECESSION OF THE EQUINOXES AND NUTATION.

Equinoctial Gales.—At the time of the equinox it is commonly believed that strong gales may be expected. This popular idea has no foundation in fact, for continued observations have failed to show any unusual prevalence of gales at this season. In one case observations taken for fifty years show that during the five days from the 21st to the 25th of March and September, there were fewer gales than during the preceding and succeeding five days.

EQUITES ("horsemen" or "knights," from epusus, "horse"), in Roman history, originally a division of the army, but subsequently a distinct political order, under which the empire resumed its military character. According to the traditional account, Romulus instituted a cavalry corps, consisting of three centuries ("hundreds") called after the three tribes from which they were taken (Ramnes, Tities, Luceres), divided into ten turmae ("squadrons") of thirty men each. The collective name for the corps was coelestes ("the swift," or possibly from coelestis, "a riding horse"); Livy, however, restricts the term to a special body-guard of Romulus. The statements in ancient authorities as to the changes in the number of the equites during the regal period are very confusing; but it is regarded as certain that Servius Tullius found six centuries in existence, to which he added twelve, making eighteen in all, a number which remained unaltered throughout the republican period. A proposal by M. Porcius Cato the elder to supplement the deficiency in the cavalry by the creation of four additional centuries was not adopted. The earlier centuries were called sex suffragia ("the six votes"), and at first consisted exclusively of patricians, while those of Servius Tullius were entirely or for the most part plebeian. Until the reform of the comitia centuriata (probably during the censorship of Gaius Flaminius in 220 B.C.; see COMITIA), the equites had voted first, but after that time this precedence was restricted to one century elected by lot from the centuries of the equites and the first class. The equites then voted with the first class, the distinction between the sex suffragia and the other centuries being abolished.

Although the equites were selected from the wealthiest citizens, service in the cavalry was so expensive that the state gave financial assistance. A sum of money (aes equestre) was given to each eques for the purchase of two horses (one for himself, the other for his groom), and the use of the same (aes hordearium); hence the name eques equestre publico. In later times, pay was substituted for the aes hordearium, three times as much as that of the infantry. If competent, an eques could retain his horse and vote after the expiration of his ten years’ service, and (till 129 B.C.) even after entry into the senate.

As the demands upon the services of the cavalry increased, it was decided to supplement the regulars by the enrolment of non-combatants, who owned horses of their own. The origin of these equites equestri privato dates back, according to Livy (v. 7.), to the siege of Veii, when a number of young men came forward and offered their services. According to Mommsen, although the institution was not intended to be permanent, in later times vacancies in the ranks were filled in this manner, with the result that service in the cavalry, with either a public or a private horse, became obligatory upon all Roman citizens possessed of a certain income. These equites equestri privato had no vote in the centuries, received pay in place of the aes equestre, and did not form a distinct corps.

Thus, at a comparatively early period, three classes of equites may be distinguished: (a) The patrician equites equestri publico of the sex suffragia; (b) the plebeian equites in the twelve remaining centuries; (c) the equites equestri privato, both patrician and plebeian.

The equites were originally chosen by the curiae, then in succession by the kings, the consuls, and (after 443 B.C.) by the censors, by whom they were reviewed every five years in the Forum. Each eques, as his name was called out, passed before the censors, leading his horse. Those whose physique and character were satisfactory, and who had taken care of their horses and equipments, were hidden to their horse on (tradusceere equum), those who failed to pass the scrutiny were ordered to sell it, in token of their expulsion from the corps. This inspection (recognition) must not be confounded with the full-dress procession (transvectio) on the 15th of July from the temple of Mars or Horos to the Capitol, instituted in 304 B.C. by the censor Q. Fabius Maximus Rullianus to commemorate the miraculous intervention of Castor and Pollux at the battle of Regillus. Both inspection and procession were discontinued before the end of the republic, but revived and in a manner combined by Augustus.

In theory, the twelve plebeian centuries were open to all free-born youths of the age of seventeen, although in practice preference was given to the members of the older families. Other requirements were sound health, high moral character and an honourable calling. At the beginning of the republican period, senators were included in the equestrian centuries. The only definite information as to the amount of fortune necessary refers to later republican and early imperial times, when it is known to have been 400,000 sesterces (about £3,500 to £4,000). The insignia of the equites were, at first, distinctly military—such as the purple-edged, short military cloak (labrata) and decorations for service in the field.

With the extension of the Roman dominions, the equites lost their military character. Prolonged service abroad possessed little attraction for the pick of the Roman youth, and recruiting for the cavalry from the equestrian centuries was discontinued. The equites remained at home, or only went out as members of the general’s staff, their places being taken by the equites equestri privato, the cavalry of the allies and the most skilled horsemen of the subject populations. The first gradually disappeared, and Roman citizens were rarely found in the ranks of the effective cavalry. In these circumstances there grew up in Rome a class of wealthy men, whose sole occupation it was to amass large fortunes by speculation in the annual public lotteries (lotteries for the years and which found a most lucrative field in the enterprise in state contracts and the farming of the public revenues. These taxfarmers (see PUBLICIANI) were already in existence at the time of the Second Punic War; and their numbers and influence increased as the various provinces were added to the Roman dominions. The change of the equites into a body of financiers was further materially promoted (a) by the lex Claudia (218 B.C.), which prohibited senators from engaging in business (except speculatively as assiduus); and (b) by the enactment in the time of Gaius Gracchus excluding members of the senate from the equestrian centuries. These two measures definitely marked off the aristocracy of birth from the aristocracy of wealth—the landed proprietor from the capitalist. The term equites, originally confined to the purely military equestrian centuries of Servius Tullius, now came to be applied to all who possessed the property qualification of 400,000 sesterces. As the equites practically monopolised the farming of the taxes, they came to be regarded as identical with the publicani, not, as Pliny remarks, because any particular rank was necessary to obtain the farming of the taxes, but because such occupation was beyond the reach of all except those who were possessed of considerable means. Thus, at the time of the Gracchi, these
EQUITES

equestrii-publicani formed a close financial corporation of about 30,000 members, holding an intermediate position between the nobility and the lower classes, keenly alive to their own interests, and ready to stand by one another when attacked. Although to some extent looked down upon by the senate as following a dishonourable occupation, they had as a rule sided with the latter, as being at least less hostile to them than the democratic party. To obtain the support of the capitalists, Gaius Gracchus conceived the plan of creating friction between them and the senators, which he carried out by handing over to them the control (a) of the jury-courts, and (b) of the revenues of Asia.

(a) Hitherto, the list of jurors for service in the majority of processes, both civil and criminal, had been composed exclusively of senators. The result was that charges of corruption and extortion failed, when brought against members of that order, even in cases where there was little doubt of their guilt. The popular indignation at such scandalous miscarriages of justice rendered a change in the composition of the courts imperative. Apparently Gracchus at first proposed to create new senators from the equites and to select the jurors from this mixed body, but this moderate proposal was rejected in favour of one more radical (see W. W. Fowler in Classical Review, July 1896). By the lex Sempronia (123 B.C.) the list was to be drawn from persons of free birth over thirty years of age, who must possess the equestrian census, and must not be senators. Although this measure was bound to set some senators and some officials in a scandal, it had the effect of increasing the lot of those chiefly concerned. In fact, it increased the burden of the luckless provincials, whose only appeal lay to a body of men whose interests were identical with those of the publicani. Provided he left the tax-gatherer alone, the governor might squeeze what he could out of the people, while on the other hand, if he were humanely disposed, it was dangerous for him to remonstrate.

(b) The taxes of Asia had formerly been paid by the inhabitants themselves in the shape of a fixed sum. The new tax was levied on the servis, direct and indirect, should be increased, and that the farming of them should be put up to auction at Rome. By this arrangement the provincials were ignored, and everything was left in the hands of the capitalists.

From this time dates the existence of the equestrian order as an officially recognized political instrument. When the control of the courts passed into the hands of the property equites, all who were summoned to undertake the duties of judges were called equites; the ordo judicium (the official title) and the ordo equester were regarded as identical. It is probable that certain privileges of the equites were due to Gracchus; that of wearing the gold ring, hitherto reserved for senators; that of special seats in the theatre, subsequently withdrawn (probably by Sulla) and restored by the lex Othonis (67 B.C.); the narrow band of purple on the tunic as distinguished from the broad band worn by the senators.

Various attempts were made by the senate to regain control of the courts, but without success. The lex Livia of M. Livius Drusus (q.v.), passed with that object, but irregularly and by the aid of violence, was annulled by the senate itself. In 82 Sulla restored the right of serving as judges to the senate, to which he elevated 300 of the most influential equites, whose support he thus hoped to secure; at the same time he indirectly dealt a blow at the order generally, by abolishing the office of the censor (immediately revived), in whom was vested the right of bestowing the public horse. To this period Mommssen assigns the regulation, generally attributed to Augustus, that the sons of senators should be knights by right of birth. By the lex Aurelia (70 B.C.) the judges were to be chosen in equal numbers from senators, equites and tribuni aerarii (see AERARIUM), the last-named being closely connected with the equites, who thus practically commanded a majority. About this time the influence of the equestrian order reached its height, and Cicero gives an object to reconcile it with the senate. In this he was successful at the time of the Catilinarian conspiracy, in the suppression of which he was materially aided by the equites. But the union did not last long; shortly afterwards the majority ranged themselves on the side of Julius Caesar, who did away with the tribuni aerarii as judges, and replaced them by equites.

Augustus undertook the thorough reorganization of the equestrian order on a military basis. The equites equo privato were abolished (according to Herzog, not till the reign of Tiberius) and the term equites was officially limited to the equites equo publico, although all who possessed the property qualification were still considered to belong to the equestrian order. For the equites equo publico high moral character, good health, and the equestrian order were necessary. Certain officers, of whom free birth was considered indispensable, the right of wearing the gold ring (ius anuli aurei) was frequently bestowed by the emperor upon freedmen, who thereby became ingenui and eligible as equites. Tiberius, however, insisted upon free birth on the father's side to the third generation. Extreme youth was no bar; the emperor Marcus Aurelius had been an eques at the age of six. The sons of senators were eligible by right of birth, and appear to have been known as equites illustres. The right of bestowing the equus publicus was vested in the emperor; once given, it was for life, and was only forfeitable through degradation for some offence or the loss of the equestrian fortune.

Augustus divided the equites into six turmae (regarded by Hirschfeld as a continuation of the sex suffragia). Each was under the command of a servis (Dequeis), who was appointed by the emperor and changed every year. During their term of office the servis had to exhibit games (ludi senariales). Under these officers the equites were divided into a large number of turmae; although not officially recognized, had the right of passing resolutions, chiefly such as embodied acts of homage to the imperial house. It is not known whether the turmae contained a fixed number of equites; there is no doubt that, in assigning the public horse, Augustus went far beyond the earlier figure of 1800. Thus, Dionysius of Halicarnassus mentions 5000 equites as taking part in a review at which he himself was present. In 35 B.C., the equites were called Gratianus. The tunic was of the narrow, purple-striped tunic, and the gold ring, the latter now being considered the distinctive badge of knighthood. The fourteen rows in the theatre were extended by Augustus to seats in the circus.

The old recognitio was replaced by the proxatio, conducted by the emperor in his censorial capacity, assisted by an advisory board of specially selected senators. The ceremony was combined with a procession, which, like the earlier transductio, took place on the 15th of July, and at such other times as the emperor pleased. As in earlier times, offenders were punished by exclusion.

In order to provide a supply of competent officers, each eques was required to fill certain subordinate posts, called militiae equestres. These were (1) the command of an auxiliary cohort; (2) the tribunate of a legion; (3) the command of an auxiliary cavalry squadron, this order being as a rule strictly adhered to. To these Septimius Severus added the centurionship. Nomination to the militiae equestres was in the hands of the emperor. After the completion of their preliminary military service, the equites were eligible for a number of civil posts, chiefly those with which the emperor himself was closely concerned. Such were various procuratorships; the prefectures of the corn supply, of the fleet, of the watch, of the praetorian guards; the governorships of recently acquired provinces (Egypt, Noricum), the others being reserved for senators. At the same time, the abolition of the indirect method of collecting the taxes in the provinces greatly reduced the political influence of the equites. Certain religious functions of minor importance were also reserved for them. In the jury courts, the equites, thanks to Julius Caesar, already formed two-thirds of the judges; Augustus, by excluding the senators altogether, virtually gave them the sole control of the tribunals. One of the chief objects of the emperors being to weaken the influence of the senate by the opposition of the equestrian order, the practice was adopted of elevating those equites who had reached a certain stage in their career to the rank of senator by adoption. Certain official posts, of which it would have been inadvisable to deprive senators, could thus be bestowed upon the promoted equites.

The control of the imperial correspondence and purse was
at first in the hands of freemen and slaves. The emperor Claudius tentatively entrusted certain posts connected with these to the equites; in the time of Hadrian this became the regular custom. Thus a civil career was open to the equites without the obligation of preliminary military service, and the emperor was freed from the pernicious influence of freedmen. After the reign of Marcus Aurelius (according to Mommssen) the equites were divided into: (a) *viri eminentissimi*, the prefects of the praetorian guard; (b) *viri perfectissimi*, the other prefects and the heads of the financial and secretarial departments; (c) subprefecti, as designated in the reign of Antonius Pius, a title by right of the procurators generally.

Under the empire the power of the equites was at its highest in the time of Diocletian; in consequence of the transference of the capital to Constantinople, they sank to the position of a mere city guard, under the control of the prefect of the watch. Their history may be said to end with the reign of Constantine the Great.

Mention may also be made of the *equites singularares Augusti*. The body-guard of Augustus, consisting of foreign soldiers (chiefly Germans and Batavians), abolished by Galba, was revived from the time of Trajan or Hadrian under the above title. It was chiefly recruited from the pick of the provincial cavalry, but contained some Roman citizens. It formed the imperial "Swiss guard," and never left the city except to accompany the emperor. In the time of Severus, these equites were divided into two corps, each of which had its uniform separate. Quaestors, who were commanded by tribune under the orders of the prefect of the praetorian guard. They were subsequently replaced by the *protoctores Augusti*.

**EQUITY** (Lat. *aequitas*), a term which in its most general sense means equality or justice; in its most technical sense it means a system of law or a body of connected legal principles, which have superseded or supplemented the common law on the ground of their intrinsic superiority. Aristotle (*Ethics*, bk. v. c. 10) defines equity as a better sort of justice, which corrupts legal justice where the latter err by being expressed in a universal form and not taking account of particular cases. When the law speaks universally, and something happens which is not according to the common course of events, it is right that the law should be modified in its application to that particular case, as the lawgiver himself would have done, if the case had been present to his mind. Accordingly the equitable man (Honestus) is he who does not push the law to its extreme, but, having legal justice on his side, is disposed to make allowances. Equity as thus described would correspond rather to the judicial discretion which modifies the administration of the law than to the antagonistic system which claims to supersede the law.

The part played by equity in the development of law is admirably illustrated in the well-known work of Sir Henry Maine on *Ancient Law*. Positive law, at least in progressive societies, is constantly tending to fall behind public opinion, and the expedients adopted for bringing it into harmony therewith are three, viz.: legal fictions, equity and statutory legislation. Equity here is defined to mean "any body of rules existing by the side of the law which was originally founded and clothed with validity incidentally to supersede the civil law in virtue of a superior sanctity inherent in those principles." It is thus different from legal fiction, by which a new rule is introduced surreptitiously, and under the pretense that no change has been made in the law, and from statutory legislation, in which the obligatory force of the rule is not supposed to depend upon its intrinsic fitness. The source of Roman equity was the fertile theory of natural law, or the law common to all nations. Even in the Institutes of Justinian the distinction is carefully drawn in the laws of a country between those which are peculiar to itself and those which natural reason appoints for all mankind. The connexion in Roman law between the ideas of equity, nature, natural law and the law common to nations, and the influence of the Stoical philosophy on their development, are fully discussed in the third chapter of the work we have referred to. The agency by which these principles were introduced was the edicts of the praetor, an annual proclamation setting forth the manner in which the magistrate intended to administer the law during his year of office. Each successive praetor adopted the edict of his predecessor, and added new equitable rules of his own, until the further growth of the irregular code was stopped by the praetor Salvius Julianus in the reign of Hadrian.

The place of the praetor was occupied in English jurisprudence by the lord high chancellor. The real beginning of English equity is to be found in the custom of handing over to that officer, for adjudication, the complaints which were addressed to the king, praying for remedies beyond the reach of the common law. Over and above the authority delegated to the ordinary councils or courts, a reserve of judicial power was believed to reside in the crown, from which the subject could not obtain relief from any inferior tribunal. To this chancellor, as already the head of the judicial system, these petitions were referred, although he was not at first the only officer through whom the prerogative of grace was administered. In the reign of Edward III. the equitable jurisdiction of the court appears to have been established. Its constitutional origin was analogous to that of the star chamber and the court of requests. The latter, in fact, was a militia court of equity attached to the lord privy seal as the court of chancery was to the chancellor. The successful assumption of extraordinary or equitable jurisdiction by the chancellor caused similar pretensions to be made by other officers and courts. "Not only the court of exchequer, whose functions were in a peculiar manner connected with royal authority, but the counties palatine of Chester, Lancaster and Durham, the court of great session in Wales, the universities, the city of London, the Cinque Ports and other places silently assumed extraordinary or equitable jurisdiction similar to that exercised in the court of chancery." Even private persons, lords and ladies, affected to establish in their honours courts of equity.

English equity has one marked historical peculiarity, viz. that it established itself in a set of independent tribunals which remained in standing contrast to the ordinary courts for many hundred years. In Roman law the judge gave the preference to the equitable rule; in English law the equitable rule was enforced by a distinct set of judges. One cause of this separation was the rigid adherence to precedent on the part of the common law courts. Another was the jealousy prevailing in England against the principles of the Roman law on which English equity to a large extent was founded.

When a case of prerogative was referred to the chancellor in the reign of Edward III., he was required to grant such remedy as should be consonant to honesty (homeitas). And honesty, conscience and equity were said to be the fundamental principles of the court. The early chancellors were ecclesiastics, and under their influence not only moral principles, where these were not regarded by the common law, but also the equitable principles of the Roman law were introduced into English jurisprudence. Between this point and the time when equity became settled as a portion of the legal system, having fixed principles of its own, various views of its nature seem to have prevailed. For a long time it was thought that precedents could have no place in equity. This was as much as it proved in each case to do that which was just; and we find this view maintained by common lawyers after it had been abandoned by the professors of equity themselves. G. Spence, in his book on the *Equitable Jurisdiction of*
EQUIVALENT—ERASMUS

the Court of Chancery, quotes a case in the reign of Charles II., in which chief Justice Vaughan said:

"It would be very unjust to let the precedents in matter of equity, for if there be equity in a case, that equity is an universal truth, and there can be no precedent in it; so that in any precedent that can be produced, if it be the same with this case, the reason and equity is the same in itself and if the precedent be not the same case with this it is not to be cited."

But the learned keeper Bridgemaker answered:

"Certainly precedents are very necessary and useful to us, for in them we may find the reasons of the equity to guide us, and besides the authority of those who made them is much to be regarded. We shall suppose they did it upon great consideration and weighing of the matter, and it would be very strange and very ill if we should disturb and set aside what has been the course for a long series of times and ages."

Selden's description is well known: "Equity is a roughish thing. 'Tis all one as if they should make the standard for measure the chancellor's foot." Lord Nottingham in 1676 reconciled the ancient theory and the established practice by saying that the conscience which guided the court was not the natural conscience of the man, but the civil and political conscience of the judge. The same tendency of equity to settle into a system of law is seen in the recognition of its limits—in the fact that it did not attempt in all cases to give a remedy when the rule of the common law was contrary to justice. Cases of hardship, which the early chancellors would certainly have relieved, were passed over by later judges, simply because no precedent could be found for their interference. The point at which the introduction of new principles of equity finally stopped is fixed by Sir Henry Maine in the chancellorship of Lord Eldon, who held that the doctrines of the court ought to be as well settled and made as uniform almost as those of the common law. From that time certainly, like common law, has professed to take its principles wholly from recorded decisions and statute law. The view (traceable no doubt to the Aristotelian definition) that equity mitigates the hardships of the law where the law errs through being framed in universals, is to be found in some of the earlier writings. Thus in the Doctor and Student it is said:

"Law makers take heed to such things as may often come, and not to every particular case, for they could not though they would; therefore, in some cases it is necessary to leave the words of the law and follow that reason and justice requireth, and to that intent equity is ordained, that is to say, to temper and mitigate the rigour of the law."

And Lord Ellesmere said:

"The cause why there is a chancery is for that men's actions are so more complex to be known that it is impossible to make any general law which shall aptly meet with every particular act and not fail in some circumstances."

Modern equity, it need hardly be said, does not profess to soften the rigour of the law, or to correct the errors into which it falls by reason of its generality.

To give any account, even in outline, of the subject matter of equity within the necessary limits of this article would be impossible. It will be sufficient to say here that the classification generally adopted by text-writers is based upon the relations of equity to the common law, of which some explanation is given above. Thus equitable jurisdiction is said to be exclusive, concurrent or auxiliary. Equity has exclusive jurisdiction where it recognizes rights which are unknown to the common law. The most important example is trusts. Equity has concurrent jurisdiction in cases where the law recognized the right but did not give adequate relief, or did not give relief without circuity of action or some similar inconvenience. And equity has auxiliary jurisdiction when the machinery of the courts of law was unable to procure the necessary evidence.

"The evils of this double system of judicature," says the report of the judicature commission (1853-1857), "and the confusion and conflict of jurisdiction to which it has led, have been long known and acknowledged." A partial attempt to remedy this was made by the Act of 1841 (passed after the reports of commissions appointed in 1850 and 1851), which enabled courts of law and equity both to exercise certain powers formerly peculiar to one or other of them. A more complete remedy was introduced by the Judicature Act 1873, which consolidated the rules of law and equity, and ordered that law and equity should be administered concurrently according to the rules contained in the 26th section of the act. At the same time many matters of equitable jurisdiction are still left to the chancery division of the High Court in the first instance. (See CHANCERY.)

AUTHORS.—The principles of equity as set out by the following works may be consulted: J. W. Selwyn, Equity Practice and Procedure, 5th ed., by W. Ashburner; and for the history see G. Spence, The Equitable Jurisdiction of the Court of Chancery (2 vols., 1846-1849); D. M. Keary, Historical Sketch of the Equitable Jurisdiction of the Court of Chancery (1896).

EQUIVALENT, in chemistry, the proportion of an element which will combine with or replace unit weight of hydrogen. When multiplied by the valency it gives the atomic weight. The determination of equivalent weights is treated in the article STOICHIOMETRY. (See also CHEMISTRY.) In a more general sense the term "equivalent" is used to denote quantities of substances which neutralize one another, as for example NaOH, HCl, H2SO4, 8Ba(OH)4.

ÉRARD, SÉBASTIEN (1752-1831), French manufacturer of musical instruments, distinguished especially for the improvements he made upon the harp and the pianoforte, was born at Strassburg on the 5th of April 1752. While a boy he showed great aptitude for practical geometry and architectural drawing, and in the workshop of his father, who was an upholsterer, he found opportunity for the early exercise of his mechanical ingenuity. When he was sixteen his father died, and he removed to Paris where he obtained employment with a harpsichord maker. Here his remarkable constructive skill, though it speedily excited the jealousy of his master and procured his dismissal, almost equally soon attracted the notice of musicians and musical instrument makers of eminence. Before he was twenty-five he set up in business for himself, his first workshop being a room in the hotel of the duchesse de Villeroi, who gave him warm encouragement. Here he constructed in 1780 his first pianoforte, which was also one of the first manufactured in France. It quickly secured for its maker such a reputation that he was soon overwhelmed with commissions, and finding assistance necessary, he sent for his brother, Jean Baptiste, in conjunction with whom he established in the rue de Bourbon, in the Faubourg St Germain, a piano manufactory, which in a few years became one of the most celebrated in Europe. On the outbreak of the Revolution he went to London where he established a factory. On his return to Paris he afterwards introduced grand pianofortes, made in the English fashion, with improvements of his own. In 1808 he again visited London, where, two years later, he produced his first double-movement harp. He had previously made various improvements in the manufacture of harps, but the new instrument was an immense advance upon anything he had before produced, and obtained such a reputation that for some time he devoted himself exclusively to its manufacture. It has been said that in the year following his invention he made harps to the value of £5,000. In 1812 he returned to Paris, and continued to devote himself to the further perfecting of the two instruments with which his name is associated. In 1825 he crowned his work by producing his model grand pianoforte with the double escopette. Érard died at Passy, on the 3rd of August 1831. (See also HARP and PIANOFORTE.)

ERASMUS, DESIDERIUS (1466-1536). Dutch scholar and theologian, was born on the night of the 27/28th of October, probably in 1466; but his statements about his age are conflicting, and in view of his own uncertainty (Ep. x. 29: 466) and the weakness of his memory for dates, the year of his birth cannot be definitely fixed. His father's name seems to have been Rogerius Gerardus. He himself was christened Erasmus; but in 1503, when becoming familiar with Greek, he assimilated the classical spelling to the Greek original, which he had a few years before Latinized into Desiderius. A contemporary authority states that he was born at Gouda, his father's native town;
but he adopted the style _Rotterdamensis_ or _Roterodamus_, in accordance with a story to which he himself gave credence. His first schooling was at Gouda under Peter Winckel, who was afterwards vice-pastor of the church. In the dull round of instruction in "grammar" he did not distinguish himself, and was surpashed by his early friend and companion, William Herman, who was Winckel's favourite pupil. From Gouda the two boys went to the school attached to St Lebuin's church at Delft, which was one of the better centers for buying and for printing books. They felt the influence of the Renaissance. Erasmus was at Deventer from 1475 to 1484, and when he left, he had learnt from Johannes Sintihius (Synthym) and Alexander Hegius, who had come as headmaster in 1483, the love of letters which was the ruling passion of his life. At some period, perhaps in an interval of his time at Deventer, he was a chorister at Utrecht under the famous organist of the cathedral, Jacob Obrecht.

About 1484 Erasmus' father died, leaving him and an elder brother Peter, both born out of wedlock, to the care of guardians, their mother having died shortly before. Erasmus was eager to go to a university, but the guardians, acting under a perhaps genuine enthusiasm for the religious life, sent the boys to another school at Hertogenbosch; and when they returned after two or three years, prevailed on them to enter monasteries. Peter went to Sion, near Delft; Erasmus after prolonged reluctance became an Augustinian canon in St Gregory's at Steyn, a house of the same order near Gouda. There he found the manuscript with which he returned to Paris at the close of 1504—Vall's _Annotations on the New Testament_, which Badius printed for him in 1505.

Shortly afterwards Lord Mountjoy invited him again to England, and this visit was more successful. He found in London a circle of learned friends through whom he was introduced to William Warham, archbishop of Canterbury, Richard Foxe, bishop of Winchester and other dignitaries. John Fisher (bishop of Rochester), who was then superintending the foundation of Christ's College for the Lady Margaret, took him down to Cambridge for the king's visit; and at length the opportunity came to fulfil his dream of seeing Italy. Baptista Boero, the king's physician, engaged him to accompany his two sons thither as supervisor of their studies. In September 1506 he set foot on that sacred soil, and took his D.D. at Turin. For a year he remained with his pupils at Bologna, and then, his engagement completed, negotiated with Aldus Manutius for a new edition of _Adagia_ upon a very different scale. The volume of 1500 had been jejune, written when he knew nothing of Greek; 800 adages put together with scanty elucidations. In 1508 he had conceived a work on lines more to the taste of the learned world, full of apt and recondite learning, and now and again relieved by telling comments or lively anecdotes. Three thousand and more collected justified a new title—_Chilades adagiorum_; and the author's reputation was now established. So secure in public favour did the book in time become, that the council of Trent, unable to suppress it and not daring to overlook it, ordered the preparation of a castrated edition.

To print the _Adagia_ he had gone to Venice, where he lived with Andrea Torresano of Asola (Asulanus) and did the work of two men, writing and correcting proof at the same time. When it was finished, with an ampler re-dedication to Mountjoy, a new pupil presented himself, Alexander Stewart, natural son of James IV of Scotland—perhaps through a connexion formed in early days at Paris. They went together to Siena and Rome and then on to Campania, thirsty under the summer sun. When they returned to Rome, his pupil departed to Scotland, to fall a few years later by his father's side at Flodden; Erasmus also found a summons to call him northwards.

On the death of Henry VII, Lord Mountjoy, who had been companion to Prince Henry in his studies, had become a person of influence. He wrote to Erasmus of a large flouring mill at Nidda and by the 'divine' young king, now with Warham sent him £10 for journey money. At first Erasmus hesitated. He had been disappointed in Italy, to find that he had not much to learn from its famed scholarship; but he had made many friends in Aldus's circle—Marcus Musurus, John Lascaris, John Colet lecturing on the Epistle to the Romans. Discussions between them on theological questions soon convinced Colet of Erasmus' worth, and he sought to persuade him to stay and teach at Oxford. But Erasmus could not be content with the Bible in Latin. Oxford could teach him no Greek, so away he must go.

In January 1500 he returned to Paris, which though it could offer no Greek teacher better than George Heremynus, was at least a better center for buying and for printing books. The next few years were spent still in preparation, supported by pupils' fees and the dedications of books; the _Collectanea adagiorum_ in June 1500 to Mountjoy, and some devotional and moral compositions to Batt's patroness and her son. When the plague drove him from Paris, he went to Orleans or Tourneheim or St Omer, as the way opened. From 1502 to 1504 he was at Louvain, still declining to teach publicly; among his friends were the future Pope Adrian VI. In January 1504 the archdeacon Philip gave him fifty livres for the Pasegeyric which "ung _religieus de l'ordre de St Augustin_" had composed on his Spanish journey; and in October, ten more, for the maintenance of his studies.

He had been working hard at Greek, of which he now felt himself master, at the Fathers (above all at Jerome), and at the Epistles of St Paul, fulfilling the promise made to Colet in Oxford, to give himself to sacred learning. But the bent of his reading was strong, the more so by the many books with which he returned to Paris at the close of 1504—Vall's _Annotations on the New Testament_, which Badius printed for him in 1505.

It was in London a circle of learned friends through whom he was introduced to William Warham, archbishop of Canterbury, Richard Foxe, bishop of Winchester and other dignitaries. John Fisher (bishop of Rochester), who was then superintending the foundation of Christ's College for the Lady Margaret, took him down to Cambridge for the king's visit; and at length the opportunity came to fulfil his dream of seeing Italy. Baptista Boero, the king's physician, engaged him to accompany his two sons thither as supervisor of their studies. In September 1506 he set foot on that sacred soil, and took his D.D. at Turin. For a year he remained with his pupils at Bologna, and then, his engagement completed, negotiated with Aldus Manutius for a new edition of _Adagia_ upon a very different scale. The volume of 1500 had been jejune, written when he knew nothing of Greek; 800 adages put together with scanty elucidations. In 1508 he had conceived a work on lines more to the taste of the learned world, full of apt and recondite learning, and now and again relieved by telling comments or lively anecdotes. Three thousand and more collected justified a new title—_Chilades adagiorum_; and the author's reputation was now established. So secure in public favour did the book in time become, that the council of Trent, unable to suppress it and not daring to overlook it, ordered the preparation of a castrated edition.

To print the _Adagia_ he had gone to Venice, where he lived with Andrea Torresano of Asola (Asulanus) and did the work of two men, writing and correcting proof at the same time. When it was finished, with an ampler re-dedication to Mountjoy, a new pupil presented himself, Alexander Stewart, natural son of James IV of Scotland—perhaps through a connexion formed in early days at Paris. They went together to Siena and Rome and then on to Campania, thirsty under the summer sun. When they returned to Rome, his pupil departed to Scotland, to fall a few years later by his father's side at Flodden; Erasmus also found a summons to call him northwards.

On the death of Henry VII, Lord Mountjoy, who had been companion to Prince Henry in his studies, had become a person of influence. He wrote to Erasmus of a large flouring mill at Nidda, and by the 'divine' young king, now with Warham sent him £10 for journey money. At first Erasmus hesitated. He had been disappointed in Italy, to find that he had not much to learn from its famed scholarship; but he had made many friends in Aldus's circle—Marcus Musurus, John Lascaris,
Baptista Egrianius, Paul Bombauius, Scipio Cartermochus; and his cardinalship had been flattering, especially in Rome, where cardinals had delighted to honour him. But to remain in Rome was to sell himself. He might have the leisure which was so indispensable, but at price of the freedom to read, think, write what he liked. He decided, therefore, to go, though with regrets; which returned upon him sometimes in after years, when the English hopes had not borne fruit.

In the autumn he reached London, and in Thomas More's house in Bickersbury wrote the witty satire which Milton founded on his famous "hands" at Cambridge in 1628, and which is read to this day. The *Morisæ encomium* was a sign of his decision. In it kings and princes, bishops and popes alike are shown to be in bondage to Folly; and no class of men is spared. Its author was willing to be beholden to any one for leisure; but he would be no man's slave. For the next eighteen months he is entirely lost to view; when he reappears in April 1531, he is leaving More's house and taking the *Morisæ* to be printed privately in Paris. Wherever they were spent, these must have been months of hard work, as were the years that followed. His time was now come. The long preparation and training, bought by privation and ungenial toil, was over, and he was ready to apply himself to the scientific study of sacred letters. His English patrons were liberal. Fisher sent him in August 1511 to teach in Cambridge; Warham gave him a benefice, Aldington in Kent, worth £53 6s. 8d. a year, and in violation of his own rule commuted it for a pension of £10 charged on the revenue of his see; and then in 1514, when there seemed no prospect of ampler preferment, he determined to transfer himself to Basel and give the results of his labours to the world.

The origin of Erasmus's connexion with Johann Froben is not clear. In 1521 he was preparing to reprint his *Adagia* with Jodocus Badius, who in the following year was to have also Seneca and Jerome. But in 1513 Froben, who had just reprinted the Aldine *Adagia*, acquired through a bookseller-agent Erasmus' amended copy which had been destined for Badius. That the agent was acting entirely on his own responsibility may be doubted; for within a few months Erasmus had decided to betake himself to Basel, bearing with him Seneca and Jerome, the latter to be incorporated in the great edition which Johannes Amerbach and Froben had had in hand since 1510. In Germany he arrived in 1514. The Strassburg Literary circle, which had befriended him, and Johannes Sapidus, headmaster of the Latin school at Schlettstadt, rode with him into Basel. Froben received him with open arms, and the presses were soon busy with his books. Through the winter of 1514-1515 Erasmus worked with the strength of ten; and after a brief visit to England in the spring, the New Testament was set up. Around him was a circle of students, some young, some already distinguished—the three sons of Froben's partner, Johannes Amerbach, who was now dead, Beatus Rhenanus, Wilhelm Nesen, Ludwig Ber, Heinrich Glareanus, Nikolaus Gerbell, Johannes Oecolampadus—who looked to him as their head and were proud to do him service.

Though from this time forward Basel became the centre of occupation and interest for Erasmus, yet for the next few years he was mainly in the Netherlands. On the completion of the New Testament in 1516 he returned to his friends in England; but his appointment, then recent, as councillor to the young king Charles, brought him back to Brussels in the autumn. In the spring of 1517 he went for the last time to England, about a dispensation from wearing his canonical dress, obtained originally from Julius II. and recently confirmed by Leo X., and in May 1518 he journeyed to Basel for three months to set the second edition of the New Testament in progress. But with these exceptions he remained in proximity to the court, living much at Louvain, where he took great interest in the foundation of the Louvain University, and the lives of the doctors. His circumstances had improved so much, by pensions, the presents which were showered upon him, and the sale of his books, that he was now in a position to refuse all proposals which would have interfered with his cherished independence. The general ardour for the restoration of the arts and of learning created an aristocratic public, of which Erasmus was supreme pontiff. Luther spoke to the people and the ignorant; Erasmus had the ear of the educated class. His friends and admirers were distributed over all the countries of Europe, and presents were continually arriving from small as well as great, from a donation of 200 florins, made by Pope Clement VII., down to sweetmeats and comfits contributed by the nuns of Cologne (Ep. 666). Froben, indeed, in particular he continued to receive supplies of money. In the last year of his life Thomas Cromwell sent him 20 angels, and Archbishop Cranmer 18. Though Erasmus led a very hard-working and far from luxurious life, and had no extravagant habits, yet he could not live upon little. The excessive delicacy of his constitution, not pampered appetite, exacted some unusual indulgences. He could not bear the stoves of Germany, and required an open fireplace in the room in which he worked. He was afflicted with the stone, and obliged to be particular as to what he drank. Beer he could not touch. The white wines of Baden or the Rhine did not suit him; he could only drink those of Burgundy or Franche-Comté. He could neither eat, nor bear the smell of, fish. "His heart," he said, "was Catholic, but his stomach was Lutheran." For his constant journeys he required two horses, one for himself and one for his attendant. And though he was almost always found in horse-flesh by his friends, the keep had to be paid for. In his literary labours, and in his unceasing care of the works of others, books were useful. In Cambrige he completed his work on the New Testament, the Letters of Jerome, and Seneca; and then in 1514, when there seemed no prospect of ampler preferment, he determined to transfer himself to Basel and give the results of his labours to the world.

Precarious as these means of subsistence seem, he preferred the independence thus obtained to an assured position which would have involved obligations to a patron or professional duties which his weak health would have made onerous. The duke of Bavaria offered to dispense with teaching; if he would only reside, and would have named him on these terms to a chair in his new university of Ingolstadt, with a salary of 200 ducats, and the reversion of one or more prebendal stalls. The archduke Ferdinand offered a pension of 400 florins, if he would only come to reside at Vienna. Adrian VI. offered him a deanery, but the offer seems to have been of a possible and not an actual deanery. Offers, flattering but equally vague, were made from France, where, with the consent of the king, Erasmus's friend and patron, "Invitator amplissimis conditionibus; offeruntur dignitates et episcopatus; plane rex esset, si juvenis esset" (Ep. xix. 305; 935). Erasmus declined all, and in November 1521 settled permanently at Basel, in the capacity of general editor and literary adviser of Froben's press. As a subject of the emperor, and attached to his court by a pension, it would have been convenient to him to have fixed his residence in Louvain. But the bigotry of the Flemish clergy, and the monkish atmosphere of the university of Louvain, overran with Dominicans and Franciscans, united for once in their enmity to the new classical learning, inclined Erasmus to seek a more congenial home in Basel. To Froben his arrival was the advent of the very man whom he had long wanted. Froben's enterprise, united with Erasmus's editorial skill, raised the press of Basel, for a time, to be the most important in Europe. The death of Froben in 1527, the final separation of Basel from the Empire, the wreck of learning in the religious disputes, and the cheap paper and scamped work of the Frankfort presses, gradually withdrew the trade from Basel. But during the years of Erasmus's co-operation the Froben press took the lead of all the presses in Europe, both in the standard value of the works published and in style of typographical execution. Like some other publishers who preferred reputation to returns in money, Froben died poor, and his impressions never reached the splendour of French printing. Collected by those of the Erasmian order, an edition of his *Letters of the Fathers* was published: of which one of the best is the edition of 1530, Cyprian (1520), Pseudo-Arnobius (1522), Hilarius (1532), Irenæus of Lyons (1526), Ambrose (1527), Augustine (1528), Chrysostom
ERASMUS

(Latin, 1539), Basil (Greek, 1532, the first Greek author printed in Germany), and Origen (Latin, 1536). In these editions, partly texts, partly translations, it is impossible to determine the respective shares of Erasmus and his many helpers. The prefaces and dedications are all written by him, and some of them, as that to the Hilarius, are of importance for the history as well of the times as of Erasmus himself. Of his most important edition, that of the Greek text of the New Testament, something will be said further on. In figure well built and graceful; of an extremely delicate constitution, sensitive to the slightest changes of climate, food or drink. After middle life he suffered from the stone, not to mention the common plague of studious men, an irritable mucous membrane. His complexion was fair; light blue eyes, and yellowish hair. Though his voice was weak, his enunciation was distinct; the expression of his face cheerful, his manner and conversation polished, affable, even charming. His highly nervous organization made his feelings acute, and his brain incessantly active. Through his ready sympathy with all forms of life and character, his attention was always alert. The active movement of his spirit spent itself, not in following out its own trains of thought, but in outward observation. No man was ever less introspective, and though he talks much of himself, his egotism is the genuineness of which takes the world into its confidence, not the selfish egotism which feels no interest but in its own woes. He says of himself, and justly, "What if I were a swine?"

(Ep. xxv. 19; 1163). There is nothing behind, no pose, no scenic effect. It may be said of his letters that in them "totam vitam sensa." His nature was flexible without being faultily weak. He has many moods and each mood imprints itself in turn on his words. Hence, on a superficial view, Erasmus is set down as the most inconsistent of men. Further acquaintance makes us feel a unity of character underlying this susceptibility to the impressions of the moment. His seeming inconsistencies are reconciled to apprehension, not by a formula of the intellect, but by the many-sidedness of a highly impressionable nature. In the words of J. Nisard, Erasmus was one of those "donna la gloire a été de beaucoup comprendre et d'affirmer peu."

This equal openness to every vibration of his environment is the key to all Erasmus's acts and words, and among them to the middle attitude which he took up towards the great religious conflict of his time. The reproaches of party assailed him in his lifetime, and have continued to be heaped upon his memory. He was loudly accused by the Catholics of collusion with the enemies of the faith. His powerful friends, the pope, Wolsey, Henry VIII., the emperor, called upon him to declare against Luther. Theological historians from that time forward have perpetuated the indictment that Erasmus sided with neither party in the struggle for religious truth. The most moderate of the censure presents him in the odious light of a trimmer; the vulgar and venomous assaulter is sure that Erasmus was a Protestant at heart, but withheld the avowal that he might not forfeit the worldly advantages he enjoyed as a Catholic. When by study of his writings we come to know Erasmus intimately, there is revealed to us one of those natures to which partisanship is an impossibility. It was not timidity or weakness which kept Erasmus neutral, but the reasonableness of his nature. It was not only that his intellect revolted against the narrowness of party, his whole being repudiated its elaborations and vulgar excesses. As he loathed fish, so he loathed clerical fanaticism. Himself a Catholic priest—"the glory of the priesthood and the shame"—the tone of the orthodox clergy was distasteful to him; the ignorant hostility to classical learning which reigned in their colleges and convents disgusted him. In common with all the learned men of his age, he wished to see the power of the clergy broken, as that of an obscurantist army arrayed against light. He had opposed all his resources to wit and satire against the priests and monks, and the superstitions in which they traded, long before Luther's name was heard of. The motto which was already current in his lifetime, "that Erasmus laid the egg and Luther hatched it," is so far true, and no more. Erasmus would have suppressed the monasteries, put an end to the domination
of the clergy, and swept away scandalous and profitable abuses, but to attack the church or re-mould received theology was far from his thoughts. And when out of Luther's revolt there arose a new fanaticism—that of evangelism, Erasmus recoiled from the violence of the new preachers. “Is it for this,” he writes to Melancthon (Ep. xix. 113; 703), “that we have shaken off bishops and popes, that we may come under the yoke of such madmen as Otto and Farel?” Passages have been collected, and it is an easy task, from the writings of Erasmus to prove that he shared the doctrines of the Reformers. Passages equally strong are needed to show that he refuted them. The truth is that theological questions in themselves had no attraction for him. And when a theological position was emphasized by party passion it became odious to him. In the words of Drummond: “Erasmus was in his own age the apostle of common sense and of rational religion. He did not care for dogma, and accordingly the dogmas of Rome, which had the consent of the Christian world, were in his eyes preferable to the dogmas of Protestantism. . . . From the beginning to the end of his career he remained true to the purpose of his life, which was to fight the battle of sound learning and plain common sense against the powers of ignorance and superstition, and amid all the convulsions of that period he never once lost his mental balance.”

Erasmus is accused of indifference. But he was far from indifferent to the progress of the revolution. He was keenly alive to its perilous influence on the cherished interest of his life, the cause of learning. “I abhor the evangelics, because it is through them that literature is everywhere declining, and upon the point of perishing.” He had shared his hopes with the hopes of the Renaissance, with its anticipation of a new Augustan age, and had seen this fair promise blighted by the irruption of a new horde of theological polemics, worse than the old scholastics, inasmuch as they were revolutionary instead of conservative. Erasmus never flouted at religion nor even at theology as such, but only at blind and intemperate theologians.

In the mind of Erasmus there was no metaphysical inclination; he was a man of the earth, with a general tendency to rational views on every subject which came under his pen. His was not the mind to originate, like Calvin, a new scheme of Christian thought. He is at his weakest in defending free will against Luther, and indeed he can hardly be said to enter on the metaphysical question. He treats the dispute entirely from the outside. It is impossible in reading Erasmus not to be reminded of the rationalist of the 18th century. Erasmus has been called the “Voltaire of theology.” But there is a vast difference in the relations in which they respectively stand toward Christian thought. Voltaire, though he did not originate, yet adopted a moral and religious scheme which he sought to substitute for the church tradition. He waged war, not only against the clergy, but against the church and its sovereigns. Erasmus drew the line at the first of these. He was not an anticipation of the 18th century; he was the man of his age, as Voltaire of his; though Erasmus did not intend it, he undoubtedly shook the ecclesiastical edifice in all its parts; and, as Melchior says of him, “pontifici Romano plus nocuit jocando quam Lutherus stomachando.”

But if Erasmus was unlike the 18th century rationalist in that he did not declare war against the church, remained a Catholic and mourned the disruption, he was yet a true rationalist in principle. The principle that reason is the one only guide of life, the supreme arbiter of all questions, politics and religion included, has its earliest and most complete exemplar in Erasmus. He does not dogmatically denounce the rights of reason, but he practically exercises them. Along with the charm of style is the great attraction of the writings of Erasmus is this unconscious freedom by which they are pervaded.

It must excite our surprise that one who used his pen so freely should have escaped the pains and penalties which invariably overtook minor offenders in the same kind. For it was not only against the clergy and the monks that he kept up a ceaseless stream of satiric raillery; he treated nobles, princes and kings with equal freedom. No 18th century republicanism, however stronger than has this pensioner of Charles V. “The people build cities, princes pull them down; the industry of the citizens creates wealth for rapacious lords to plunder; plebeians and magistrates pass good laws for kings to violate; the people love peace, and their rulers stir up war.” Such outbursts are frequent in the Adagia. These freedoms are part cause of Erasmus’s popularity. He was here in sympathy with the secret sore of his age, and gave utterance to what all felt but none dared to whisper but he. It marks the difference between 1534 and 1669 that, in a reprint of the Julius Exclusus published in 1669 at Oxford, it was thought necessary to leave out a sentence in which the writer of that dialogue, supposed by the editor to be Erasmus, asserts the inferiority of states and kings to the bad kings. It is difficult to say to what we are to ascribe his immunity from painful consequences. We have to remember that he was removed from the scene early in the reaction, before force was fully organized for the suppression of the revolution. And his popular works, the Adagia, and the Colloquy (1524), had established themselves as standard books in the more easy going age, when power, secure in its unchallenged strength, could afford to laugh with the laughers at itself. At the date of his death the Catholic revival, with its fell aptitude for art and letters, was only in its infancy; and when times became dangerous, Erasmus cautiously declined to venture out of the protection of the Empire, refusing repeated invitations to Italy and to France. “I had thought of going to Besançon,” he said, “ne on essem in ditione Caesaris” (Ep. xxx. 74; 1299).

In Italy a Bembo and a Sadoletto wrote a purer Latin than Erasmus, but contended themselves with pretty phrases, and were careful to touch not living chord of feeling. In France it was necessary for a Rabelais to hide his free-thinking under a disguise of revolting and unintelligible jargon. It was only in the Empire that such liberty of speech as Erasmus used was practicable, and in the Empire Erasmus passed for a moderate man. Upon the strength of an established character for moderation he enjoyed an exceptional licence for the utterance of unwelcome truths; and in spite of his flings at the rich and powerful, he remained through life a privileged person with them. But though the men of the keys and the sword let him go his way unmolested, it was otherwise with his brethren of the pen. A man who is always launching opinions must expect to be retorted on. And when these judgments were winged by epigram, and weighted by the name of Erasmus, who stood at the head of letters, a widespread exasperation was the consequence. Disraeli has not noticed Erasmus in his Quarrels of Authors, perhaps because Erasmus’s quarrels would require a volume to themselves. He could not draw blood from a stone. When Carpe expressed it, he could not himself restrain his pen from sarcasm. He forgot that though it is safe to lash the dunces, he could not with equal impunity sneer at those who, though they might not have the ear of the public as he had, could yet contradict and call names. And when literary jealousy was complicated with theological differences, as in the case of the free-thinkers, or with French vanity, as in that of Budeaues, the cause of the enemy was espoused by a party and a nation. The quarrel with Budeaues was strictly a national one. Cosmopolitan as Erasmus was, to the French literati he was still the Teuton. Étiene Dolet calls him “enemy of Cicero, and jealous detractor of the French name.” The only contemporary name which could approach to a rivalry with his was that of Budeaues (Budé), who was exactly contemporary, having been born in the same year as Erasmus. Rivals in fame, they were unlike in accomplishment, each having the quality which the other wanted. Budeaues, a Frenchman, knew Greek well; Erasmus, though a Dutchman, very imperfectly. But the Frenchman Budeaues wrote an execrable Latin style, unreadable then as now, while the Teuton Erasmus charmed the reading world with a style which, though far from good Latin, is the most delightful which the Renaissance has left us.

The style of Erasmus is, considered as Latin, incorrect, sometimes even barbarous, and far removed from any classical model. But it has qualities far above purity. The best Italian Latin is but an echo and an imitation; like the painted glass which
Erasmus

we put in our churches, it is an anachronism. Rembo, Sadoleto and the rest write purely in a dead language. Erasmus's Latin was a living and spoken tongue. Though Erasmus had passed nearly all his life in England, France and Germany, his conversation was Latin; and the language in which he talked about common things he wrote. Hence the spontaneity and naturalness of his page, its flavour of life and not of books. He writes from himself, and not out of Cicero. Hence, too, he spoiled nothing by anxious revision in terror lest some phrase not of the golden age of Greek should intrude from his pen. He confesses apologetically to Christopher Longolius (Ep. iii. 63; 402) that it was his habit to extemporize all he wrote, and that this habit was incorrigible; "effundo verius quam scribo omnia." He complains that much reading of the works of St Jerome had spoiled his Latin; but, as Scaliger says (Scalig. 27), "Erasmus's language is better than St Jerome's." The same critici, however, thought Erasmus would have done better "if he had kept more closely to the classical models."

In the annals of classical learning Erasmus may be regarded as constituting an intermediate stage between the humanists of the Latin Renaissance and the learned men of the age of Greek scholarship, between Angelo Poliziano and Joseph Scaliger. Erasmus, though justly styled by Muretus (Var. Lect. 7, 15) "eruditus sane vir, ac multae lectionis," was not a "learned" man in the special sense of the word—not an "erudite. He was more than this: he was the master of letters the range of his education which had appeared in Europe since the fall of the Roman empire. His acquisitions were vast, and they were all brought to bear upon the life of his day. He did not make a study apart of antiquity for its own sake, but used it as an instrument of culture. He did not worship, imitate and reproduce the classics, like the Latin humanists who preceded him; he did not master them and reduce them to a special science, as did the French Hellenists who succeeded him. He edited many authors, it is true, but he has left rather the means of forming a text, not did he actually do so. In editing a father, or a classic, he had in view the practical utility of the general reader, not the accuracy required by the gild of scholars. "His Jerome," says J. Scaliger, "is full of sad blunders" (Scalig. 27). Even Julien Garnier could discover that Erasmus "falls in his haste into grievous error in his Latin version of St Basil, though his Latinity is superior to that of the other translators" (Pref. in Opp. St. Bas., 1721). It must be remembered that the commercial interests of Froben's press led to the introduction of Erasmus's name on many a title page when he had little to do with the book, e.g. the Latin Josephus of 1524 to which Erasmus only contributed one translation of 14 pages; or the Aristotle of 1531, of which Simon Grynaeus was the real editor. Where Erasmus excelled was in prefaces—not philological introductions to each author, but spirited appeals to the interest of the general reader, showing how an ancient book might be made to minister to modern spiritual demands.

Of Erasmus's works the Greek Testament is the most memorable. It has no title to be considered as a work of learning or scholarship, yet its influence upon opinion was profound and durable. It contributed more to the liberation of the human mind from the thraldom of the clergy than all the uproar and rage of Luther's many pamphlets. As an edition of the Greek Testament it has no critical value. But it was the first, and it revealed the fact that the Vulgate, the Bible of the church, was not only a second-hand document, but in places an erroneous one. A shock was thus given to the credit of the clergy in the province of literature, equal to that which was given in the province of science by the astronomical discoveries of the 17th century. Even if Erasmus had had at his disposal the MSS. subsidia for forming a text, he had not the critical skill required to use them. He had at hand a few late Basel MSS., one of which he sent straight to press, correcting them in places by collations of others of which he had no knowledge. The text thus be sent to him by Collet in England. In four reprints, 1519, 1524, 1527, 1535, Erasmus gradually weeded out many of the typographical errors of his first edition, but the text remained essentially such as he had first printed it. The Greek text indeed was only a part of his scheme. An important feature of the volume was the new Latin version, the original being placed alongside as a guarantee of the translator's good faith. This translation, with the justificatory notes which accompanied it, though not itself a work of critical scholarship, became the starting-point of modern exegetical science. Erasmus did nothing to solve the problem, but he helped him the honour of having first propounded it.

Besides translating and editing the New Testament, Erasmus paraphrased the whole, except the Apocalypse, between 1517 and 1548. The paraphrases were received with much enthusiasm, even by those who had little appreciation for Erasmus. In England a translation of them which was made in 1548 was ordered to be placed in all parish churches beside the Bible. His correspondence is perhaps the part of his works which has the most permanent value; it comprises about 3000 letters, which form an important source for the history of that period. For the same purpose his Colloquies may be consulted. They are a series of dialogues, written first for pupils in the early Paris days as formule de polite address, but afterwards expanded into lively conversations, in which many of the topics of the day are discussed. Later in the century they were read in schools, and some of Shakespeare's lines are direct reminiscences of Erasmus.

His complete works have been printed twice; by the Froben firm under the direction of his literary executors (9 vols., Basel, 1540); and by Jacob Wetzer at Leiden (11 vols., 1570—1576). The Controversiae, edited by O. Frobenius Lucratornum, was composed first in 1523 and enlarged in September 1524; and also in a letter to Hector Bloece of Aberdeen, in 1530. An early critical bibliography, called Bibliotheca Erasmiana, was undertaken by the officials of the Ghent University Library; it is divided into three sections, for Erasmus's writings, the books he edited, and the literature about him. Actes sommieres et historiques were issued in 1683; and since 1807 the completed volumes have been appearing at intervals. There is an excellent sketch of Erasmus's life down to 1519 in F. Seebohm's Oxford Reformers (3rd ed., 1887); and two familiar narratives, one of which has appeared in many biographies, of Erasmus's life are the work of S. Knight (2 vols., 1758—1760) and R. B. Drummond (2 vols., 1873) may be mentioned. There are also two volumes (1901—1904) of translations by F. M. Nichols from Erasmus's letters down to 1517, with an ample commentary which amounts almost to a biography; and an edition of the letters, in Latin, was begun by the Oxford University Press in 1906 (vol. ii., 1910).

(M. P.: P. S. A.)

Eras tus, Thomas (1524—1583), German-Swiss theologian, whose surname was Lü er, Lieder, or Lieber, was born of poor parents on the 7th of September 1524, probably at Baden, canton of Aargau, Switzerland. In 1540 he was studying theology at Basel. The plague of 1544 drove him to Bologna and thence to Padua as student of philosophy and medicine. In 1553 he became physician to the count of Henneberg, Saxe-Meiningen, and in 1558 held the same post with the elector-palatine, Otto Heinrich, being at the same time professor of medicine at Heidelberg. His patron's successor, Frederick III, made him (1559) a privy councillor and member of the church consistory. In theology he followed Zwingli, and at the sacramental conferences of Heidelberg (1560) and Maulbronn (1564) he advocated by voice and pen the Zwinglian doctrine of the Lord's Supper, replying (1565) to the counter arguments of the Lutheran Johann Marbach, of Strassburg. He ineffectually resisted the efforts of the Calvinists, led by Caspar Olevianus, to introduce the Presbyterian polity and discipline, which were established at Heidelberg in 1570, on the Genevan model. One of the first new churches was the church of the Gmelins, a sect of which was on a charge of Socinianism, founded on his correspondence with Transylvania. The ban was not removed till 1575, Erasmus declaring his firm adhesion to the doctrine of the Trinity. His position, however, was uncomfortable, and in 1580 he returned to Basel, where in 1583 he was made professor of ethics. He died on the 31st of December 1583. He published several pieces bearing on medicine, astrology and alchemy, and attacking the system of the Lollards. His name is also noted as the author of a humorous publication, written in 1568. His immediate occasion was the disputation at Heidelberg (1568) for the doctorate of theology by George Wither or Withers, an English Puritan (subsequently archdeacon of Colchester), silenced (1562) at Bury St Edmunds.
by Archbishop Parker. Withers had proposed a disputa
tion against vestments, which the university would not allow; his
thesis affirming the excommunicating power of the presbytery
was sustained. Hence the treatise of Erastus. It was published
(1599) by Giacomo Castelverti, who had married his widow,
the name of the alleged printer is an anagram of Jacobum Cas-
telverti Sahater: Stationers' marks (June) containing the
name of the printer is said to have been "allowed" by Archbishop
Whitgift. It consists of seventy-five Theses, followed by a
Conformatio in six books, and an appendix of letters to Erastus
by Bullinger and Guatither, showing that his Theses, written in
1568, had been circulated in manuscript. An English transla-
tion of the Theses, with brief life of Erastus (based on Melchior
Adami's account), was issued in 1659, entitled The Nullity of
Church Censures; it was reprinted as A Treatise of Excommunica-
tion (1662), and revised by Robert Lee, D.D., in 1684. The
aim of the work is to show, on Scriptural grounds, that sins of
professing Christians are to be punished by civil authority, and not
by withholding of sacraments on the part of the clergy. In the
Westminster Assembly a party holding this view included Selden,
Lightfoot, Coleman and Whitepole, whose speech (1643) is
appealed to Lee's version of the Theses; but the opposite view,
after much controversy, was carried, Lightfoot alone dissenting.
The consequent chapter of the Westminster Confession ("Of
Church Censures") was, however, not ratified by the English
parliament. "Erastianism," as a by-word, is used to denote
the doctrine of the supremacy of the state in ecclesiastical causes;
but the problem of the relations between church and state is one
on which Erastus nowhere enters. What is known as "Erastian-
ism" would be better connected with the name of Grotius.
The only direct reply made to the Expositio was the Tractus
de vera excommunicatione (1599) by Theodore Beza, who found
himself rather savagely attacked in the Conformatio thesium;
respecto: Apostolum et Mosen adeoque Deum ipsum aude corrigere."

Kirche (1896). (A. G.)

ERASTOSTHENES OF ALEXANDRIA (c. 276 - c. 194 B.C.), Greek
scientist, writer, was born at Cyrene. He studied grammar under
Callimachus at Alexandria, and philosophy under the Stoic Aristo
and the Academic Arcesilas at Athens. He re-
turned to Alexandria at the summons of Ptolemy III. Euergetes,
by whom he was appointed chief librarian in place of Callimachus.
He is said to have died of voluntary starvation, being threatened
with total blindness. Eratosthenes was one of the most learned
men of antiquity, and wrote on a great number of subjects. He
was the first to call himself Philologos (in the sense of the "friend
of learning"), and the name Pentathlos was bestowed upon him
in honour of his varied accomplishments. He was also called
Beta as being second in all branches of learning, though not
actually first in any. In mathematics he wrote two books On
means (τιμησμένοιοι) which are lost, but appear, from a
remark of Pappus, to have dealt with "loici, with reference
to means." He devised a mechanical construction for two
mean proportionals, reproduced by Pappus and Eutocius (Comm.-
on Archimedes). His συστημα των σωμάτων was bestowed upon him
as a device for discovering all prime numbers. He laid the
foundation of mathematical geography in his Geographica,
in three books. His greatest achievement was his measurement
of the earth. Being informed that at Syene (Assuan), on the day
of the summer solstice at noon, a well was lit up through all its
depth, so that Syene lay on the tropic, he measured, at the same
hour, the zenith distance of the sun at Alexandria. He thus found
the distance between Syene and Alexandria (known to be 5000
stadia) to correspond to 46° of a great circle, and so arrived
at 250,000 stadia (which he seems subsequently to have corrected
to 253,000) as the circumference of the earth. He is credited
by Ptolemy and his commentator Theon with having found the
distance between the tropics to be 56° rds. of the meridian circle,
which gives 23° 51' 20" for the obliquity of the ecliptic. His
astronomical poem Hermer began apparently with the birth
and exploits of Hermes, then passed to the legend of his having
ordered the heavens, the zones and the stars, and gave a history
of the latter. His Erigone, of which a few fragments are also
preserved, is sometimes spoken of as a separate poem, but it may
have belonged to the Hermer, which appears also to have been
known by other names such as Catalogoi. The still extant
fragments of Catoptrics, containing a story of certain stars in prose,
is probably not by Eratosthenes.

Eratosthenes was the founder of scientific chronology in his
ευροφόροπλαφία in which he endeavoured to fix the dates of the
chief literary and political events from the conquest of Troy.
An important work was his treatise on the old comedy, dealing with
theatres and theatrical apparatus generally, and discussing the
works of the principal comic poets themselves. Works on moral
philosophy, history, and a number of letters were also attributed
to him.

There is a complete edition of the fragments of Eratosthenes by
Bernhardi (1822); poetical fragments, Hillier (1872); geographical,
Seidel (1799) and Berger (1880); eratosthoepol, Schaubach (1799) and

ERBACH, a town of Germany, in the grand-duchy of Hesse-
Darmstadt, on the Mümling, 22 m. S.E. of Darmstadt. It has
cloth mills and ivory-turning, for which last branch it possesses a
technical school. Wool and cattle fairs are held twice a year.
Pop. 2800. The castle contains an interesting collection of
weapons and pictures, and in the chapel are the coffins of Einhard,
the friend and biographer of Charlemagne, and his wife, Emma.

Erbach has long been the residence of the counts of Erbach,
who trace their descent back to the 11th century, and who held
the office of cupbearer to the electors palatine of the Rhine until
1806. In 1535 the emperor Charles V. made the county a direct
fief of the Empire, on account of the services rendered by Count
Eberhard during the Peasants' War. Since 1717 the family has
been divided into the three lines of Erbach-Fürstenau, Erbach-
Erbach and Erbach-Schönberg, who rank for precedence, not
according to the age of their descent, but according to the age of
the chief of their line. In 1818 the count of Erbach-Erbach
inherited the county of Wartenberg-Roth, and in 1903 the count
of Erbach-Schönberg was granted the title of prince. The
county was mediatized in 1806, and is now incorporated with the
duchy of Hesse-Darmstadt.

See Simon, Die Geschichte der Dynasten und Grafen zu Erbach
(Frankfort, 1858).

ERS, symbol, Er; atomic weight, 165-166), one of the
metals of the rare earths. The first of the rare earth
minerals was discovered in 1794 by J. Gadolin and was named gadolinite
from its discoverer. In 1797 Ekeberg showed that gadolinite
continued another rare earth, which was given the name yttria.
Yttria is an exceedingly complex mixture, which has
been decomposed, yielding as an intermediate product terbia.
This latter substance in its turn has been split by J. L. Soret, P. T.
Lobele, Lecoq de Boisbaudran, and others into erbium, holmium,
dysprosium, and ytterbium, but it is still doubtful whether any one
of these four splitting products is a single substance. The rare
earth metals are found in the minerals gadolinite, samarskite,
fergusonite, euxenite and cerite. They are separated from
the minerals by converting them into oxalates, which by
ignition give the corresponding oxides. The oxides are then converted
to double sulphates which are separated from each other by
repeat fractional crystallization or by fractional precipitation
with ammonia or some other base. Eutribium forms rose-coloured
salts and a rose-coloured oxide. The oxide dissolves slowly in
acids; it is not reduced by hydrogen and is insuble. The
salts show a characteristic absorption spectrum.

bach (Monatsh., 1893, 1, p. 641; 1884, 5, p. 208; 1885, 6, p. 477);
P. T. Cleve (Comptes rendus, 1879, 89, p. 472; 1880, 91, p. 328,
Ercilla y Zúñiga—Ereich

Ercilla y Zúñiga, Alonso de (1533–1595), Spanish soldier and poet, was born in Madrid on the 7th of August 1533. In 1548 he accompanied to the heir-apparent to the throne Philip II. In this capacity Ercilla visited Italy, Germany, the Netherlands, and was present in 1545 at the marriage of his master to Mary of England. Hearing that an expedition was preparing to subdue the Araucanians of Chile, he joined the adventurers. He distinguished himself in the ensuing campaign; but, having quarrelled with a comrade, he was condemned to death in 1558 by his general, Garcia Hurtado de Mendoza. The sentence was commuted to imprisonment, but Ercilla was speedily released and fought at the battle of Quipeo (14th of December 1558). He returned to Spain in 1562, visited Italy, France, Germany, Bohemia, and in 1570 married Maria de Bazán, a lady distantly connected with the Santa Cruz family; in 1571 he was made knight of the order of Santiago, and in 1578 he was employed by Philip II. on a mission to Saragossa. He complained of living in poverty but left a modest fortune, and was obviously disappointed at not being offered the post of ambassador. His principal work is La Araucana, a poem based on the events of the wars in which he had been engaged. It consists of three parts, of which the first, composed in Chile and published in 1569, is a versified narrative adhering strictly to historic fact; the second, published in 1578, is encumbered with visions and other romantic machinery; and the third, which appeared in 1589–1590, contains, in addition to the subject proper, a variety of episodes mostly irrelevant. This so-called epic lacks symmetry, as it has been overworked by Cervantes and Voltaire; but it is written in excellent Spanish, and is full of vivid rhetorical passages. An analysis of the poem was given by Hayley in his Essay on Epic Poetry (1782).

A good biography precedes the Morceaux choisis (Paris, 1900) by Jean Ducamin.

Ereichmann–Chatrion, the joint names of two French writers whose collaboration made their work that of so, to speak, one personality. Émile Erichmann (1822–1890) was born on the 20th of May 1822 at Phalsbourg, and Louis Gratien Charles Alexandre Chatrion (1826–1890) on the 8th of December 1826 at Soldastenthal, Lorraine. In 1847 they began to write together, and continued doing so till 1889. Chatrion died in 1890 at Villemomble near Paris, and Erichmann at Lunévile in 1890. The list of their publications is a long one, ranging from the Histoires et contes fantastiques (1849; reprinted from the Démocrite du Rhin), L’ Illustrateur Muséus (1850), Madame Thérèse (1852), L’ Ami Frère (1854), Histoire d’un couvent de 1873 (1864), Waterton (1865), Le Blocus (1867), Histoire d’un paysan (4 vols., 1866–1870), L’Histoire du plébiscite (1872), to Le Grand-père Lébique (1886); besides dramas like Le Joli polonais (1860) and Les Rantsou (1882). Without any special literary claim, their stories are distinguished by simplicity and genuine descriptive power, particularly in the battle scenes and in connexion with Alsatian peasant life. They are marked by a genuine democratic spirit, and by real patriotism, which is shown after 1870 in their loyalty to the French régime. The authors attacked militarism by depicting the horrors of war in the plenest terms.

See also J. Clarieie, Erichmann–Chatrion (1883), in the series of "Célébrités contemporaines."

Erdélyi, János (1814–1868), Hungarian poet and author, was born in 1814 at Kapos, in the county of Ungvár, and educated at the Protestant college of Sárospatak. In 1833 he removed to Pest, where he was, in 1839, elected member of the Hungarian Academy of Sciences. His literary fame was made by his collection of Hungarian national poems and folk-tales, Magyar néphiteleiet gyűjtésenév, Népdalok és Mondások (Pest, 1846–1847). This work, published by the Kisfaludy Society, was supplemented by a dissertation upon Hungarian national poetry, afterwards partially translated into German by Stier (Berlin, 1851). Erdélyi also compiled for the Kisfaludy Society an extensive collection of Hungarian proverbs—Magyar kínámdások könyve (Pest, 1851)—and was for some time editor of the Settirodalmi Szemle (Review of Poetic Literature). In 1848 he was appointed director of the national theatre at Pest; but after 1849 he resided at his native town. He died on the 3rd of January 1868. A collection of folk-tale was published the year after his death, entitled A Négycsolátsz népdalok, népmesék és kínámdások (Pest, 1869) ; this work contains 230 national songs, 19 folk-tales and 736 Hungarian proverbs.

Erdmann, Johann Eduard (1805–1892), German philosophical writer, was born at Wolmar in Livonia on the 13th of June 1805. He studied theology at Dorpat and afterwards at Berlin, where he fell under the influence of Hegel. From 1849 to 1852 he was a minister of religion in his native town. Afterwards he devoted himself to philosophy, and qualified in that subject at Berlin in 1854. In 1856 he was professor-extraordinary at Halle, became full professor in 1859, and died there on the 12th of June 1892. He published many philosophical text-books and treatises, and a number of sermons; but his chief claim to remembrance rests on his elaborate Grundriss der Geschichte der Philosophie (2 vols., 1866), the 3rd edition of which has been translated into English. Erdmann's special merit is that he does not rest content with being a mere summarizer of opinions, but ventures in the role of critic and expositor; and his book is the outcome of a long and ever-developing effort to solve the great speculative problems with which man has been confronted in all ages. His chief other works were: Leib und Seele (1837), Grundriss der Logik und Metaphysik (1841), and Psychologische Briefe (1851).

Erdmann, Otto Limné (1804–1869), German chemist, son of Karl Gottfried Erdmann (1774–1835), the physician who introduced vaccination into Saxony, was born at Dresden on the 21st of April 1804. In 1829 he began to attend the medico-chirurgical academy of his native place, and in 1832 he entered the university of Leipzig where in 1837 he became extraordinary professor, and in 1830 ordinary professor of chemistry. This office he held until his death, which happened at Leipzig on the 8th of October 1869. He was particularly successful as a teacher, and the laboratory established at Leipzig under his direction in 1845 was long regarded as a model institution. As an investigator he was best known for his work on nickel and indigo and other dye-stuffs. With R. F. Marchand (1832–1890) he also carried out a number of determinations of atomic weights. In 1828, in conjunction with A. F. G. Werther (1815–1869), he founded the Journal für technische und ökonomische Chemie, which became in 1834 the Journal für praktische Chemie. He was also the author of Über das Nickel (1837), Lehrbuch der Chemie (1838), Grundriss der Wissenschaftenkunde (1853), and Über das Studium der Chemie (1861).

Erebus, in Greek mythology, son (according to Hesiod, Theog. 123) of Chaos, and father of Aether (upper air) and Hemera (day) by his sister Nyx (night). The word, which signifies darkness, is in Homer the gloomy subterranean region through which the departed shades pass into Hades. The entrance to it was in the extreme west, on the borders of Ocean, in the mythical land of the Cimmerians. It is to be distinguished from Tartarus, the place of punishment for the wicked.

Erech (Uruk in the Babylonian inscriptions; Gr. Orchoe), the Biblical name of an ancient city of Babylonia, situated E. of the present bed of the Euphrates, on the line of the ancient Nil canal, in a region of marshes, about 140 m. S.S.E. from Bagdad. It was one of the oldest and most important cities of Babylonia, and the site of a famous temple, called E-Anna, dedicated to the worship of Nana, or Ishtar. Erech played a very important part in the political history of the country from an early time, but tries in exhibiting the history of human society before the time of Sargon. Later it was prominent in the national struggles of the Babylonians against Elam (2000 B.C. and earlier), in which it suffered severely; recollections of these conflicts are embodied in the Gilgamesh epic, as it has come down to us
through the library of Assur-bani-pal. Erehch enjoyed much distinction in the later times, as a seat of learning and of the worship of Ishtar, and Assur-bani-pal drew largely on its literary stores for his library at Nineveh, from which we derive our principal information concerning ancient Babylonian literature. The inscriptions found here show that it continued in existence through the Persian and Seleucid periods. The ruins of the ancient site, known as Waraka, which are among the largest in all Babylonia, forming an irregular circle nearly 6 m. in circumference, bounded by a wall, still standing in some places to the height of 40 ft., were explored and partially excavated by W. K. Loftus in 1850 and 1854. The most conspicuous ruin, now called Abu-Berdi, "Father of Marsh Grass," or Buwariye, "reed matting," because of the layers of reeds between each twelve courses of unbaked brick, is the zigurat (tower) of the ancient temple of E-Anna. It is about 100 ft. in height, and strikingly resembles in general appearance the ruins of the zigurat of the temple of Enil of Nippur. Second to this in size was the ruin called Wuswas, a walled quadrangle, including an area of more than seven and a half acres, within which was an edifice 246 ft. long and 174 ft. wide, elevated on an artificial platform 50 ft. in height. The south-west façade, still standing in some places to the height of 23 ft., exhibited an interesting use of half columns, and stepped recesses for purposes of decoration. In another ruin Loftus found a wall, 30 ft. long, composed entirely of small yellow terra-cotta nail-headed cones, such as have been found in great numbers inscribed and uninscription used for votive purposes in connexion with walls at Tello and elsewhere in Babylonia. His excavations being superficial, the Babylonian inscriptions found by him, about one hundred in all, exclusive of the ancient Ur-Gur bricks from the temple, belong in general to the neo-Babylonian, Persian and Seleucid periods. The older remains are buried deep beneath the huge mass of later debris. Loftus also discovered at Erehch, almost everywhere within and without the walls, great numbers of clay coffins piled one above another, to the height of over 30 ft., forming a vast and, on the whole, well-ordered cemetery belonging to the Persian, Parthian and later occupations of Babylonia, during which period Erehch, like other cities of the south, evidently became a necropolis for a large extent of country. After Loftus's time the mounds were visited by various travellers, but no further excavations have been conducted. Work on this important part of the site is attended with very great difficulties, owing to the inaccessible position of the ruins, the unsettled character of the country, the frequent sand-storms, and above all, the immense mass of material of later periods which must be removed before a systematic excavation of the more ancient and interesting ruins could be undertaken. A curious feature of the Waraka neighbourhood is the existence of conical sand-hills, rising to a considerable height, so compact as to be almost like stone. These hills extend from Waraka northward as far as Tel Ede.

See W. K. Loftus, Chaldeas and Susiana (1857); J. P. Peters, Nippur (1897); E. Sachau, Am Euphrat und Tigris (1900). Cf. also Nippur and authorities there quoted. (J. P. PE.)

ERECHTHEUM, a temple (commonly called after Erechtheus, to whom a portion of it was dedicated) on the acropolis at Athens, unique in plan, and in its execution the most refined example of the Ionic order. There is no clear evidence as to when the building was begun, some placing it among the temples projected by Pericles, others assigning it to the time after the peace of Nicias in 421 B.C. The work was interrupted by the stress of the Peloponnesian War, but in 409 B.C. a commission was appointed to make a report on the state of the building and to undertake its completion, which was carried out in the following year.

The peculiar plan of the Erechtheum has given rise to much speculation. It may be due partly to the natural configuration of the rock and the differences of level, partly to the desire of a single building for objects of ancient sanctity, such as the mark of Poseidon's trident and the spring that arose from it, the sacred olive tree of Athens, and the tomb of Cecrops. But there are some features which cannot be so explained, and which have led Professor W. Dürpfeld and others to believe that the plan of the temple, as we now have it, is a modification or abridgment of the original design, due to the same conservative influences as led to the curtailment of the plan of the Propylaea (q.v.).

The building as completed consisted of a temple of the ordinary type, opening by a door and two windows to the east front, before which stood a portico of six Ionic columns. This part was the temple of Athena Polias. Adjoining it on the west was the central chamber, on a lower level; this chamber was separated by a partition, originally of wood and later of marble, from the western compartment of the temple, which was of peculiar construction. The west end was formed by a wall, on which stood four columns between antae; but the main entrance to this western compartment was through a large and very ornate doorway on the north; and a large Ionic portico, consisting of four columns in the front, and one in the return on each side, was placed in front of this door. At the south end of the western compartment was a smaller door, with steps leading up to the higher level, within a projecting space enclosed by a low wall and covered with a projecting porch carried by six "maidens" or Caryatides. The construction of the building at this southwestern corner shows that there was some sacred object that had to be bridged over by a huge block of marble; this we know from inscriptions to have been the Cecropium or tomb of Cecrops. In the north portico a square hole in the floor, with a corresponding hole in the roof above it, must have given access to another sacred object, the mark of Poseidon's trident in the rock. The sacred olive tree probably stood just outside the temple to the west in the Pandroseion. The Ionic order, as used in this temple, is of the most ornate Attic type. The bases of the columns are either reeded or decorated with a plait-pattern; the capital has the broad channel between the volutes sub-divided by a carefully-profiled incision; and the top of the shafts is ornamented by a broad band of palmette or honeysuckle pattern. A similar band of ornament runs round the top of the walls outside, and at their base is a reeded torus. The frieze consisted of white marble figures in relief, affixed to a background of black Eleusinian stone.

The contents of the Erechtheum are described by Pausanias. It contained the ancient image of Athena Polias, and three altars, one to Poseidon and Erechtheus, one to Butes and one to Hephaestus; there were portraits of the family of the Butades on the walls. Within it was also the gold lamp of Callimachus, which burnt for a year without refilling, and had a chimney in the form of a palm-tree.

The Erechtheum was damaged by a fire, soon after its completion, in 406 B.C., but was repaired early in the following century. The west end appears to have been damaged in Roman times and to have been replaced by the attached columns with
windows between them which appear in old drawings and are still partially extant. It was used as a church in Christian times, and under Turkish rule as the harem of the governor of Athens. Lord Elgin carried off to London, about 1801-1803, one of the columns of the east portico and one of the caryatids; these were replaced later by terra-cotta casts. During the siege of Athens in 1827, the roof of the north portico was blown down and the building was otherwise much damaged. It was partially rebuilt between 1838 and 1846; the west front was blown down in a storm in 1852. Since 1900 the project of rebuilding the Erechtheum as far as possible with the original blocks has again been undertaken.

**ERECHTHEUM** in Greek legend, a mythical king of Athens, originally identified with Erechtheus, but in later times distinguished from him. According to Homer, who knows nothing of Erechtheus, he was the son of Aroura (Earth), brought up by Athena, with whom his story is closely connected. In the later story (son of Hephhest and Aribe, and then, possibly, of Erechtheus herself) was handed over by Athena to the three daughters of Cecrops—Aglauros (or Agraules), Herse and Pandrosos—in a chest, which they were forbidden to open. Aglauros and Herse disobeyed the injunction, and when they saw the child (which had the form of a snake, or round which a snake was coiled) they went mad with fright, and threw themselves from the rock of the Acropolis (or were killed by the snake). Athena herself then appeared before the daughters of Cecrops, and took possession of the kingdom of Athens. Here he established the worship of Athena, instituted the Panathenaea, and built an Erechtheum. The Erechtheus of later times was supposed to be the grandson of Erechtheus-Erechtheus, and was also king of Athens. When Athens was attacked by the Thracian Eumolpus (or by the Eleusians assisted by Eumolpus) victory was promised Erechtheus if he sacrificed one of his daughters. Eumolpus was slain and Erechtheus was victorious, but was himself killed by Poseidon, the father of Eumolpus, or by a thunderbolt from Zeus. The contest between Erechtheum and Eumolpus formed the subject of a lost tragedy by Euripides; Swinburne has utilized the legend in his Erechtheus. The scene of the opening of the chest is represented on a Greek vase in the British Museum. The name Erechtheus is connected with ἕρχομαι ("earth") and the representation of him as half-snake, like Cercops, indicates that he was regarded as one of the autochthones, the ancestors of the Athenians who sprung from the soil.

See Apollodorus iii. 14. 15; Euripides, Ion; Ovid, Metam. ii. 553; Hyginus, Poeti. astron. ii. 13; Pausanias i. 2. 5. 8; E. Ermanatiger, Die attische Autolochonkenspiegel (1897); article by J. A. Hild in Daremberg and Saglio's Dictionnaire des antiquités; B. Fowell in Cornell Studies, xvii. (1906), who identifies Erechtheus, Erechtheus, Poseidon and Cercops, all denoting the sacred serpent of Athena, which cult she first contested, but then amalgamated with her own. The birth of Erechtheus is related in many different ways, and is interpreted by Mannhardt as a mythic way of describing the growth of the corn, and by J. E. Harrison (Myth. and Monuments of Ancient Athens, 1897), as a fiction to explain the ceremony performed by the two maidens called Arerophorai. See also Farnell, Cults of the Greek States, i. 290; and Frazer's Pausanias, ii. 169.

**EREKSHIGAL,** also known as ALLATU, the name of the chief Babylonian goddess of the nether-world where the dead are gathered. Her name signifies "lady of the nether-world." She is known to us chiefly through two myths, both symbolizing the change of seasons, but intended also to illustrate certain doctrines developed in the temple-schools of Babylonia. One of these myths is the famous story of Ishtar's descent to Irkalla or Aralu, as the lower world was called, and her reception by her sister who presides over it; the other is the story of Nergal's offence against Erekhigal, his banishment to the kingdom controlled by the goddess and the reconciliation between Nergal and Erekhigal through the latter's offer to have Nergal share the honours of the rule over Irkalla. The story of Ishtar's descent is told to illustrate the possibility of an escape from Irkalla, while the other myth is intended to reconcile the existence of two rulers of Irkalla—a goddess and a god.

It is evident that it was originally a goddess who was supposed to have control of Irkalla, and not a god, according to Ishtar in control of fertility and vegetation on earth. Erekhigal is therefore the sister of Ishtar and from one point of view her counterpart, the symbol of nature during the non-productive season of the year. As the doctrine of two kingdoms, one of this world and one of the world of the dead, becomes crystallized, the dominions of the two sisters are sharply differentiated from one another. The addition of Nergal represents the harmonizing tendency to unite with Erekhigal as the queen of the nether-world the god who, in his character as god of war and of pestilence, conveys the living to Irkalla and thus becomes the one who presides over the dead.

(M. J.A.)

**ERESTRIA (mod. Aletria),** an ancient coast town of Eubeoa about 15 m. S.E. of Chalcis, opposite to Oropus. Erestria, like its neighbour Chalcis (q.v.), early entered upon a commercial and colonizing career. Besides founding colonies in the west of Greece, it assisted Athens in the war against Persia, and joined the great mercantile alliance of Miletus and Aegina. Since the so-called Lelantine War (7th century B.C.) against the coming league of Chalcis, it began to be overshadowed by its rivals. The interference of Erestria in the Ionian revolt (498) brought upon it the vengeance of the Persians, who captured and destroyed it shortly before the battle of Marathon (490). The city was soon rebuilt, and as a member of both the Delian and Corinth leagues attached itself by numerous treaties to the Athenians. This latter, through their general Phocion, rescued it from the tyrants subsidized by Philip of Macedon (354 and 341). Under Macedonian and Roman rule Erestria fell into insignificance; for a short period under Mark Antony, the triumvir, it became a possession of Athens. Erestria was the birthplace of the tragedian Achaeanus and of the "Megarian" philosopher Menemecus.

The modern village, which is sometimes called Nea Pitaraka because the inhabitants of Pitaraka were transferred there in 1821, is on unhealthy low-lying ground near the sea. The excavation of the site was carried out by the American School of Athens (1890-1895). At the foot of the Acropolis Hill, where the ground begins to rise, the theatre lies; and though the material of which this was built is rough, and only seven imperfect rows of seats remain, a good part of the scena and of the chambers behind it is preserved, and beneath these there runs a tunnel, about one hundred and eighty feet in length. This, together with other features, has raised some questions in connexion with the arrangement of the Greek theatre, the orchestra being at present on a level about 12 ft. below that of the rooms in the scena. Near by are the substructions of a temple of Dionysus and a large altar, and also a gymnasion with arrangements for bathing. Besides these, in 1900 the substructions of a temple of Apollo Daphnephorus were unearthed. Both the northern and the southern side of the hill are flanked by walls, which seem to have reached the sea, where there was a mole and a harbour; and the wall of the acropolis itself remains in one part to the height of eight courses. (E. G.)

**ERETRIAN SCHOOL OF PHILOSOPHY.** This Greek school was the continuation of the ElIan school, which was transferred to Eretria by Menedemus. It was of small importance, and in the absence of certain knowledge must be supposed to have adhered to the doctrines of Socrates. (See MENEDEMUS.)

**ERFURT,** a city of Germany, in Prussian Saxony, on the Gera, and the railway Halle-Bebra, about midway between Gotha and Weimar, which are 14 m. distant. Pop. (1875) 48,025; (1905) 100,065. The city, which is dominated on the
west by the two citadels of Petersberg and Cyriaxburg, is irregularly built, the only feature in its plan, or want of plan, being the Friedrich Wilhelmsplatz, a broad open space of irregular shape abutting on the Petersberg. On the south-western side of this square, which contains a monument to the elector Frederick Charles Joseph of Mainz (1719-1802), is the Domberg, an eminence on which stand, side by side, the cathedral and the great church of St Severus with its three spires (14th century). The churches are approached by a flight of forty-eight stone steps, the grouping of the whole mass of buildings being exceedingly impressive. The cathedral (Beate Marie Virginis) is one of the oldest in Germany. The choir dates from the 12th century, but the nave was rebuilt in the 13th in the Gothic style. The magnificent chancel (1349-1372), with the 14th-century crypt below, rests on massive substructures, known as the *Castra*. The twin towers are set between the chancel and nave. The cathedral contains, besides fine 15th-century glass, some very rich portal sculptures and bronze castings, among others the coronation of the Virgin by Peter Vischer. In one of its towers is the famous bell, called Maria Gloriosa, which bears the date 1492, and weighs 370 cwt. Besides the cathedral and St Severus, which are Roman Catholic, Erfurt possesses several very interesting medieval churches, now Evangelical. Among these may be mentioned the Predigerkirche, dating from the latter half of the 12th century; the Reglerkirche, a Romanesque building (restored in 1859) with a 12th-century tower; and the Barfüsserkirche, a Gothic building containing fine 14th-century monuments. It was here that the famous Thuringian choral movement was born. The former religious houses there survive a Franciscan convent, with a girls' school attached, and an Ursuline convent. The Augustinian monastery, in which Luther lived as a friar, is now used as an orphanage, under the name of the *Martinissi.* The cell of Luther was destroyed by fire in 1872. A bronze statue of the reformer was erected in the Anger, the chief street of the town, in 1890. At one time Erfurt had a university, of which the charter dated from 1392; but it was suppressed in 1816, and the buildings devoted to other purposes, among these being the endowment of an institution founded in 1758 and now called the royal academy of sciences, and the support of the royal library, which now contains 60,000 volumes and over 1000 manuscripts. On the W. and S.W. extensive new quarters have grown up within recent years, e.g. Hirschbrühl. The interior of the town hall (1860-1875) is adorned with legendary and historical frescoes by Kämpfer and Peter Janssen. Erfurt possesses also a picture gallery. - University of Erfurt.

The educational establishments of the town include a gymnasium, a realgymnasium, a realschule, technical schools for building and handicrafts, a high-class commercial school, a school of agriculture, and an academy of music. The most notable industry of Erfurt is the culture of flowers and of vegetables, which is very extensively carried on. This industry had its origin in the large gardens attached to the monasteries. It has also important and growing manufactures of ladies' mantles, boots and shoes, machines, furniture, woolen goods, musical instruments, agricultural machinery and implements, leather, tobacco, chemicals, &c. Brewing, bleaching and dyeing are also carried on on a large scale, and there are extensive railway works and a government rifle factory.

Erfurt (Med. *Ersfurd*, Erphorde, Lat. *Esfordia*) is a town of great antiquity. Its origin is obscure, but in 741 it was sufficiently important for St Boniface to found a bishopric here, which was, however, after the martyrdom of the first bishop, Adolar, in 755, reabsorbed in that of Mainz. In 803 the place received certain market rights from the emperor Charlemagne. Later the overlordship was claimed by the archbishops of Mainz, on the strength of charters granted by the emperor Otto I., and their authority in Erfurt was maintained by a burggrave and an *advocatus*, the office of the latter becoming in the 12th century hereditary in the family of the counts of Gleichen. In spite of many vicissitudes (from 1109 to 1137, for instance, the town suffered under the later grandees of Thuringia), and of a charter granted in 1242 by the emperor Frederick II., the archbishops succeeded in upholding their claims. In 1355, however, Archbishop Gerhard I. had to grant the city municipal rights, the burggravian disappear, and Erfurt became practically a free town. Its power was at its height early in the 15th century, when it joined the Hanseatic League. It had acquired by force or purchase various countships and other fiefs in the neighbourhood, and ruled a considerable territory; and its wealth was so great that in 1378 it established a university, the first in Europe that embraced the four faculties. By the end of the century, however, its prosperity had sunk owing to the perpetual feud with Mainz, the internecine war in Saxony, and the consequent dwindling of its commerce. By the convention of Erfurt in 1555 the overlordship of Erfurt was ultimately transferred by the electors of Mainz to Saxony. The political and religious quarrels of the 16th century still further depressed the city, in which the reformed religion was established in 1521. Then came the Thirty Years' War, during which Erfurt was for a while occupied by the Swedes. After the peace of Westphalia (1648) the city was assigned by the emperor to the elector of Mainz, and, on its refusal to submit, it was placed under the ban of the Empire (1665). In 1664 it was captured by the troops of the archbishop of Mainz, and remained in the possession of the electorate till 1802, when it came into the possession of Prussia. In 1808 it was the scene of the memorable interview between Napoleon and the emperor Alexander I. of Russia, at which the kings of Bavaria, Saxony, Westphalia and Württemberg also assisted, which is known as the congress of Erfurt. Here in 1850 the parliament of the short-lived Prussian Northern Union (known as the Erfurt parliament) held its sittings. In 1928 the 100th anniversary of the city's incorporation with Prussia was celebrated.

See W. A. von Tettau, *Erfurt in seiner Vergangenheit und Gegenwart* (Erfurt, 1860); C. Beyer, *Geschichte der Stadt Erfurt* (Erfurt, 1900); and F. W. Kampuchte, *Die Universität Erfurt in ihrem Verhältnisse zu dem Humanismus und der Reformation* (1866-1858). For a detailed bibliography see U. Chevalier, *Répertoire des sources. Topo-bibliographie* (Montpellier, 1894-1899), &c. - Ergot, or Scurvy Rye, the drug *ergot* or *Secale cornutum* (Ger. *Mutterkorn*; Fr. *sève ergot*), consisting of the sclerotium (or hard resting condition) of a fungus, *Claviceps purpurea*, parasitic on the pistils of many members of the Grass family, but obtained almost exclusively from rye, *Secale cereale*. In the ear of rye that is infected with ergot a species of fermentation takes place, and there exudes from it a sweet yellowish mucus, which after a time disappears. The ear loses its stalk, and ceases to grow, and its ovaries become penetrated with the white grain. This, the mycelium of the fungus which towards the end of the season forms the sclerotium, in which state the fungus lies dormant through the winter.

The drug consists of grains, usually curved (hence the name, from the O. Fr. *arget*, a cock's spur), which are violet-black or dark-purple externally, and whitish with a tinge of pink within, are between 3 and 14 in. long, and from 1 to 4 lines broad, and have two lateral furrows, a close fracture, a disagreeable rancid taste, and a faint, fishy odour, which last becomes more perceptible when the powder of the drug is mixed with potash solution. Ergot should be kept in stoppered bottles in order to preserve it from the attacks of a species of mite, and to prevent the oxidation of its fatty oil.

The extremely complex composition of this drug has been studied in great detail, and with such important results that instead of giving ergot itself by the mouth in doses of 20 to 60 grains, it is now possible to obtain much more rapid and certain results by giving one three-hundredth of a grain of one of its constituents hypodermically. This constituent is the alkaloid cornutine, which is the valuable ingredient of the drug. Other ingredients are a fixed oil, present to the extent of 30%, ergotinic acid, a glucoside, trimethylamine, which gives the drug its unpleasant odour, and spahcine, a non-nitrogenous resinsoid body. Of the numerous preparations only two need be mentioned—the liquid extract (dose 10 minims to a draught with water), and the hypodermic injection. The latter does not keep well, and the best way of using ergot is to dissolve tablets obtained from a reputable maker, and containing some of the...
active principles, in pure water, the solution being injected subcutaneously. Ergot, a who external action. Given internally it stimulates the intestinal muscles and may cause diarrhoea. After absorption it slows the pulse by stimulation of the vagus nerves. It has indeed been asserted that the slow pulse characteristic of the puerperal period is really due to the common administration of ergot at that time. This is probably an exaggeration. The important actions of ergot are on the blood-vessels and the uterus. The drug greatly raises the blood-pressure by causing extreme contraction of the arteries. This is mainly due to a direct action on the muscular coat of the vessel but is partly of central origin, since the drug also stimulates the vasomotor centre in the medulla oblongata. This action on the vessels is so marked as to constitute the drug a haemostatic, not only locally but also remotely. It may arrest bleeding from the nose, for instance, when injected hypodermically. Nearly all the constituents share in causing this action, but the sphecalinic acid is probably the most potent. Ergot is the most powerful known stimulant of the pregnant uterus. The action is a double one. At least four of its constituents act directly on the muscular fibre of the uterus, whilst the cornutine acts through the nerves. Of great practical importance is the fact that the cornutine causes rhythmic contractions such as naturally occur, whilst the sphecalinic acid produces a tonic contraction of the uterus, which is unnatural and highly injurious to the life of the foetus. Ergot is used in therapeutics as a haemostatic, and is very valuable in haemorrhage. The haemostatic action of the drug is of great use in obstetrics. The drug should regularly be given hypodermically, and it is important to note that if the injection be made immediately under the skin, an abscess, or considerable discomfort, may ensue. The injection should be intra-muscular, the needle being boldly plunged into a muscular mass, such as that of the deltoid or the gluteal region. The indications for the use of ergot in obstetrics are highly complex and demand detailed treatment. It can only be said here that the drug should, in the rarest possible cases be given whilst the child is still in utero. This rule is necessitated by the sphecalinic acid, which causes an unnatural state of the organ. When it is possible to obtain pure cornutine, which is unfortunately very expensive, the precautions necessary in other cases may be abrogated. Chronic poisoning, or ergotism, used frequently to occur amongst the poor fed on rye infected with the Claviceps. As it is practically impossible to reproduce the symptoms of ergotism not only in the experimental in the lower animals, or when the drug is being administered to a human being for some therapeutic purpose, it is believed that the symptoms of ergotism were rendered possible only by the semi-starvation which must have ensued from the use of such rye-bread; for the grain disappears as the fungus develops. There were two types of ergotism. In the gangrenous form various parts of the body underwent gangrene as a consequence of the arrest of blood-supply produced by the action of sphecalinic acid on the arteries. In the spasmodic form the symptoms were of a nervous character. The initial indications of the disease were cutaneous itching, tingling and formation, which gave place to actual loss of cutaneous sensation, first observed in the extremities. Amblyopia and some loss of hearing also occurred, as well as mental failure. With weakness of the voluntary muscles went intermittent spasms which weakened the patient and ultimately led to death by implication of the respiratory muscles. The last known "epidemic" of ergotism occurred in Lorraine and Burgundy in the year 1816.

**ERIC XIV.** (1553–1577), king of Sweden, was the only son of Gustavus Vasa and Catherine of Saxe-Lauenburg. The news of his father's death reached Eric as he was on the point of embarking for England to press in person his suit for the hand of Queen Elizabeth. He hastened back to Stockholm, after burying his father, summoned a Riksdag, which met at Arboga on the 15th of the new year. His proposals knew but one arbogetic, considerably curtailing the authority of the royal dignitaries, John and Charles, in their respective provinces. Two months later Eric was crowned at Upsala, on which occasion he first introduced the titles of baron and count into Sweden, by way of attaching to the persons of the nobles and barons receiving lucrative fiefs adequate to the maintenance of their new dignities.

From the very beginning of his reign Eric's morbid fear of the upper classes drove him to give his absolute confidence to a man of base origin and bad character, though, it must be admitted, of superior ability. This was Göran Persson, born about 1530, who had been educated abroad in Lutheran principles, and after narrowly escaping hanging at the hands of Gustavus in connection with some sterile action entered the service of his son. The powerful upstart was the natural enemy of the nobility, who suffered much at his hands, though it is very difficult to determine whether the initiative in these prosecutions proceeded from him or his master. Göran was also a determined opponent of Duke John, with whom Eric in 1563 openly quarrelled, because John, contrary to the royal orders, had married (Oct. 4, 1562) Catherine, daughter of Sigismund I. of Poland, engaging at the same time to assist the Polish king to conquer Livonia. This act was a flagrant breach of that paragraph of the Arboga articles which forbade the royal dukes to contract any political treaty without the royal assent. An army of 10,000 men was immediately sent by Eric to John's duchy of Finland, and John and his consort were seized, brought over to Sweden and detained as prisoners of state in Gripsholm Castle. But Eric did not stop here. His suspicion suggested to him that, if his own brother failed in the loyalty of the haemostatic, especially the members of the ancient Sture family, who had been notable in Sweden when the Vasas were unknown, could not be depended upon. The head of the Sture family at this time was Count Svante, who had married a sister of Gustavus Vasa's second wife, and had by her a numerous family, of whom two sons, Nils and Eric, still survived. The dark tragedy, known as the Sture murders, began with Eric XIV.'s strange treatment of young Count Nils. In 1564 he was summoned before a newly erected tribunal and condemned to death for gross neglect of duty, though not one of the frivolous charges brought against him could be substantiated. The death penalty was commuted into a punishment worse because more shameful than death. On the 15th of June 1566 the unfortunate youth, bruised and bleeding from shocking ill-treatment, was placed upon a wretched hack, with a crown of straw on his head, and led in derision through the streets of Stockholm. The following night he was sent a prisoner to the Zea (or Zeke) lass, an old lass, as an ambassador extraordinary, and despatched to Lorraine to resume the negotiations for Eric's marriage with the princess Renata. Before he returned, however, Eric had resolved to marry Karin, or Kitty Månsdatter, the daughter of a common soldier, who had been his mistress since 1565. In January 1567 Eric extorted a declaration from two of his senators that they would assist him to punish all who should try to prevent his projected marriage; and, in the middle of May, a Riksdag was summoned to Upsala to judge between the king and those of the aristocracy whom he regarded as his personal enemies. Eric himself arrived at Upsala on the 16th in a condition of incipient insanity. On the 19th he opened parliament in a speech which, as he explained, he had to deliver extempore owing to "the treachery" of his secretary. Two days later Nils Sture arrived at Upsala fresh from his embassy to Lorraine, and was at once thrown into prison, where other members of the nobility were already detained. On the following day Eric murdered Nils in his cell with his own hand, and by his order the other prisoners were despatched by the royal provost marshal forthwith. These murders were committed so promptly and secretly that it is doubtful whether the estates, actually in session at the same place, knew what had been done when, on the 26th of May, under violent pressure from Göran Persson, they signed a document declaring that all the accused gentlemen under detention had acted like traitors, and that all sentences already passed or that might be passed upon them.

During the greater part of 1567 Eric was so deranged that a
committee of senators was appointed to govern the kingdom. One of his illusions was that he was king but his brother John, whom he now set at liberty. When, at the beginning of 1568, Eric recovered his reason, a reconciliation was effected between the king and the duke, on condition that John recognized the legality of his brother's marriage with Karin Månslatter, and her children as the successors to the throne. A month later, on the 4th of July, he was solemnly married to Karin at Stockholm by the primate. The next day Karin was crowned queen of Sweden and her infant son Gustavus proclaimed prince-royal. Shortly after his marriage Eric issued a circular ordering a general thanksgiving for his delivery from the assaults of the devil. This document, in every line of which madness is legible, convinced most thinking people that Eric was unfit to reign. The royal dukes, John and Charles, had already taken measures to depose him; and in July the rebellion broke out in Östergötland. Eric at first offered a stout resistance and won two victories; but on the 17th of September the dukes stood before Stockholm, and Eric, after surrendering Göran Persson to the horrible vengeance of his enemies, himself submitted, and resigned the crown. On the 30th of September 1568 John III. was proclaimed king by the army and the nobility; and a Riksdag summoned to Stockholm, confirmed the choice and formally deposed Eric on the 25th of January 1569. For the next seven years the ex-king was a source of the utmost anxiety to the new government. No fewer than three rebellions, with the object of releasing and reinstating him, had to be suppressed, and his prison was changed half a dozen times. On the 10th of March 1575, an assembly of notables, lay and clerical, at John's request, pronounced a formal sentence of death upon him. Two years later, on the 24th of February 1577, he died suddenly in his new prison at Örbyhus, poisoned, it is said, by his governor, Johan Henriksen. 

See Sveriges Historia, vol. iii. (Stockholm, 1880); Robert Niebet Bain, Scandinavia, cap. 4–6 (Cambridge, 1905); Eric Tegel, Konung Erik 14. historia (Stockholm, 1751). (R. N. B.)

ERICACEAE, in botany, a natural order of plants belonging to the higher or gamopetalous division of Dicotyledons. They are woody plants, sometimes with a slender creeping stem as in bilberry, Vaccinium (fig. 1), or Andromeda (fig. 2), or forming low bushes as in the heaths, or larger, sometimes becoming tree-like, as in species of Rhododendron. The leaves are alternate, opposite or whorled in arrangement, and in their form and structure show well-marked adaptation for life in dry or exposed situations. Thus in the true heaths they are needle-like, with the margins often rolled back to form a groove or an almost closed chamber on the under side. In others such as Rhododendron or Arbutus they are often leathery and evergreen, the strongly cuticularized upper surface protecting a water-storing tissue situated above the green layers of the leaf. The flowers are sometimes solitary and axillary or terminal as in Andromeda, but are generally arranged in racemose inflorescences at the end of the branches as in Arbutus and Rhododendron, or on small lateral shoots as in Erica. They are hermaphroditic and generally regular with parts in 4 or 5, thus: sepals 4 or 5, petals 4 or 5, stamens 8 or 10 in two series, the outer of which is opposite the petals, and carpels 4 or 5. The corolla is usually more or less bell-shaped, and in the heaths persists in a dry state in the fruit. The petals with the stamens are situated on the outer edge of a honey-secreting disk. The anthers show a very great variety in shape, the halves are often more or less free and often appended; they open to allow the escape of the pollen by a terminal pore or slit. The carpels are united to form a 4- to 5-chambered ovary, which bears a simple elongated style ending in a capitate stigma; each ovary-chamber contains one to many ovules attached to a central placenta. The brightly coloured main attached to the central axis. 5. Diagram of the flower having four sepals, four divisions of the corolla, eight stamens in two rows, and four divisions of the pistil.

Fig. 1.—Vaccinium vitis-idaea, with leaf and flower, nat. size. 1. Flower of V. myrtillus, cut lengthwise. 2. Fruit of same. 3. Capsule showing loculicidal dehiscence; a few seeds re-corolla, the presence of nectar and the scent render the flowers attractive to insects, and the projection of the stigma beyond the anthers favours crossing. The fruit is generally a capsule containing many seeds, as in Erica (fig. 3) or Rhododendron; sometimes a berry as in Arbutus.

The order falls into four distinct tribes, which are characterized by the relative position of the ovary and by the fruit and seed. They are as follows:—

1. Rhododendron tribe, characterized by capsular fruit, seed with a loose coat, deciduous petals and anthers without appendages. It consists mainly of the great genus Rhododendron (in which Azalea is included by recent botanists), which is chiefly
ERICHSEN—ERIDANUS

developed in the mountains of eastern Asia, many species occur-
ring on the Himalayas. Daboecia, St Daboec's heat, occurs
in Ireland.

2. Arbutoidea. — Fruit a berry or capsule, petals deciduous
and anthers with bristle-like appendages, chiefly north temperate
to arctic in distribution. Arbutoidea Umbello, the strawberry-tree,
small shrub of the large southern hemisphere has a southward
species which extends into south Ireland. Arctostaphylos
(beerberry) and Andromeda are arctic and alpine genera occurring
in Britain. Epigaeus repens is the trailing arbutus or mayflower
of Atlantic America.

3. Vaccinium Tribe. — Overly inferior, fruit a berry. Extends
from the north temperate zone to the mountains of the tropics.
Vaccinium, the largest genus, has four British species: V.
Myrtillus is the bilberry (q.v.), blueberry or whortleberry,
V. Vitis-Idaea the cowberry, and V. Oxycoccus the cranberry
(q.v.). This tribe is sometimes regarded as a separate order
Vaccinioideae, distinguished by its inferior ovary.

4. Erica Tribe. — Fruit usually a capsule, seeds round, not
winged; corolla persisting round the ripe fruit; anthers often
appended. The largest genus is Erica, the true heath (q.v.),
with over 400 species, the great majority of which are confined
to the Cape; others occur on the mountains of tropical Asia,
and in Europe and North Africa, especially the Mediterranean
region. E. Cinerea (purple heather) and E. Tetralix (cross-leaved
heath) are common British heaths. Calluna is the ling or Scotch
heather.

ERICHSEN, SIR JOHN ERIC, Bart. (1818-1896), British
surgeon, born on the 19th of July 1818 at Copenhagen, was the
son of Eric Erichsen, a member of a well-known Danish family.
He studied medicine at University College, London, and at
Paris, devoting himself in the early years of his career to
physiology, and lecturing on general anatomy and physiology
at University College hospital. In 1844 he was secretary to
the physiological section of the British Association, and in 1845
he was awarded the Forthgillian gold medal of the Royal Humane
Society for his essay on asphyxia. In 1848 he was appointed
assistant surgeon at University College hospital, and in 1850
became full surgeon and professor of surgery, his lectures and
clinical teaching being much admired; and in 1855 he joined the
consulting staff. His Science and Art of Surgery (1853) went
through many editions. He rose to be president of the College
of Surgeons in 1880. From 1879 to 1881 he was president of the
Royal Medical and Chirurgical Society. He was created a
baronet in 1895, having been for some years surgeon-extra-
ordinary to Queen Victoria. As a surgeon his reputation was
world-wide, and he counts (sir Sir W. MacCormac in his volume
on the Centenary of the Royal College of Surgeons) "among the
masters of modern surgery." He was a recognized authority
on concussion of the spine, and was often called to give evidence
in court on obscure cases caused by railway accidents, &c.
He died at Folkestone on the 23rd of September 1896.

ERICHTSCH, a lake partly in Inverness-shire and partly in
Perthshire, Scotland, lying between the districts of Badenoch
on the N. and Rannoch on the S. The boundary line is drawn
from a point opposite to the mouth of the Alder, and follows
the centre of the longitudinal axis north-eastwards to 56° 00'
N., where it strikes eastwards to the shore. All of the lake to
the S. and E. of this line belongs to Perthshire, the rest, forming
the major portion, to Inverness-shire. It is a lonely lake, situated
in extremely wild surroundings at a height of 1153 ft. above
the sea, being thus the loftiest lake of large size in the United
Kingdom. It is over 144 m. long, with a mean breadth of half
a mile and over 1 m. at its maximum. Its area amounts to some
71 sq. m., its average depth of an area of nearly 9 sq. m.
The mean depth is 18 ft., and the maximum 512 ft.
It has a general trend from N.E. to S.W., the head lying 1 m.
from Dalwhinnie station on the Highland railway. It receives
many streams, and discharges at the south-western extremity
by the Erich. Salmon and trout afford good fishing. The
surrounding mountains are lofty and rugged. Ben Alder (3757 ft.)
onto the west shore is the chief feature of the great Currour
der forest. The only point of interest on the banks is the cavern,
near the mouth of the Alder, in which Prince Charles Edward
concealed himself for a time after the battle of Culloden.

ERICSON, JOHN (1830-1896), Swedish-American naval
engineer, was born at Langbanshyttan, Wermland, Sweden, on
the 31st of July 1856. He was the second son of Olaf Ericsson,
and was first obtained an interest in marine engineering. In
his earliest years a strong mechanical bent, young Ericsson, at the
age of twelve, was employed as a draughtsman by the Swedish
Canal Company. From 1820 to 1827 he served in the army,
where his drawing and military maps attracted the attention
of the king, and he soon attained the rank of captain. In 1826
he went to London, at first on leave of absence from his regiment,
and in partnership with John Braithwaite constructed the "Novelty," a locomotive engine for the Liverpool & Manchester
railway competition at Rainhill in 1829, when the prize, however,
was won by Stephenson's "Rocket." The number of Ericsson's
inventions at this period was very great. Among other things
he worked out a plan for marine engines placed entirely below
the water-line. Such engines were made for the "Victory,
for Captain (afterwards Sir) John Ross's voyage to the Arctic
regions in 1839, but they did not prove satisfactory. In 1833
he patented a marine engine which was put under public
exhibition, but could not find a buyer. He took out a patent
for a screw-propeller, and though the priority of his invention
could not be maintained, he was afterwards awarded a one-
fifth share of the £50,000 given by the Admiralty for it.
At this time Captain Stockton, of the United States navy, gave
an order for a small iron vessel to be built by Laird of Birkenhead,
and to be fitted by Ericsson with engines and screw. This vessel
reached New York in May 1839. A few months later Ericsson
followed his steamer to New York, and there he resided for the
rest of his life, establishing himself as an engineer and a builder
of iron ships. In 1848 he was naturalized as a citizen of the
United States. He had many difficulties to contend with, and
it was only by slow degrees that he established his fame and won
his way to competence. At his death he seems to have been
worth about £50,000. The provision of defensive armour for
ships of war had long occupied his attention, and he had con-
structed plans and a model of a vessel lying low in the water,
carrying one heavy gun in a circular turret mounted on a turn-
table. In 1854 he sent his plans to the emperor of the French.
Louis Napoleon, however, acting probably on the advice of
Dupuy de Lôme, declined to use them. The American Civil
War, and the report that the Confederates were converting the
"Merrimac" into an ironclad, caused the navy department to
invite proposals for the construction of armoured ships. Among
others, Ericsson replied, and as it was thought that his design
might be serviceable in island waters, the first armoured turret
ship, the "Monitor," was ordered; she was launched on the
30th of January 1862, and on the 9th of March she fought the
celebrated action with the Confederate ram "Merrimac." The
peculiar circumstances in which she was built, the great import-
ance of the battle, and the decisive nature of the result gave the
"Monitor" an exaggerated reputation, which further experience
did not confirm. In later years Ericsson devoted himself to the
study of torpedoes and screw motors. He published Salter
Investigations (New York, 1875) and Contributions to the Central
Exhibition (New York, 1872). He died in New York on the 8th
of March 1889, and in the following year, on the request of the
Swedish government, his body was sent to Stockholm and thence
into Wermland, where, at Filipstad, it was buried on the 15th
of September.

A Life of Ericsson by William Conant Chat was published in
New York in 1890 and London in 1893.

ERIDANUS, or FLUVIS ("the river"), in astronomy, a
constellation of the southern hemisphere, mentioned by Eudoxus
(4th century B.C.) and Aratus (3rd century B.C.); Ptolemy
catalogued 34 stars in it. θ Eridani, a fine double star of magni-
itudes 3-5 and 5-5, is now of the third magnitude. It is supposed
to be identical with the Achernar of Al-Sufi, who described it
as of the first magnitude; this star has therefore decreased in
brilliance in historic times. The star η Eridani (numbered 40

470
by Flansteed) was discovered to be a ternary star group by Herschel in 1783; it consists of a close pair, of magnitudes 9.2 and 9.9, revolving in a period of 180 years, associated with a star of magnitude 4.5, which is distant from the pair by 82; these stars have an exceptionally swift proper motion, about 4" per annum. Eridanus was the ancient name of the river Po. Eridu or Erid, S. E. of Babylon, was the earliest known seat of the Tigris civilization, a very ancient city of great importance in history. It was described in the ancient Babylonian records as the "city of the deep." The special god of this city was Ea (q.v.), god of the sea and of wisdom, and the prominence given to this god in the incantation literature of Babylonia and Assyria suggests not only that many of our magical texts are to be traced ultimately to the temple of Ea at Eridu, but that this side of the Babylonian religion had its origin in that place. Certain of the most ancient Babylonian myths, especially that of Adapa, may also be traced back to the shrine of Ea at Eridu. But while all the first importance in matters of religion, there is no evidence in Babylonian literature of any special political importance attaching to Eridu, and certainly at no time within our knowledge did it exercise hegemony in Babylonia. The site of Eridu was discovered by J. E. Taylor in 1854, in a ruin then called by the natives Abu-Sharheen, a few miles south-south-west of Moghbir, ancient Ur, nearly in the centre of the dry bed of an inland sea, a deep valley, 15 m. in its broadest, covered for the most part with a plain incrustation, separated from the alluvial plain about Moghbir by a low, pebbly, sandstone range, called the Hazem, but open toward the north to the Euphrates and stretching southward to the Khasna wadi below Suk-es-Sheluhk. In the rainy season this valley becomes a sea, flooded by the discharge of the Khasna; in summer the Arabs dig holes here which supply them with brackish water. The ruins, in which Taylor conducted brief excavations, consisted of a platform of fine sand enclosed by a sandstone wall, 20 ft. high, the corners toward the cardinal points, on the N.W. part of which was a pyramidal tower of two stages, constructed of sun-dried brick, cased with a wall of kiln-burned brick, the whole still standing to a height of about 70 ft. above the platform. The summit of the first stage was reached by a staircase on the S.E. side, 15 ft. wide and 70 ft. long, constructed of polished marble slabs, fastened with copper bolts, embedded at the foot by two curious columns. An inclined road led up to the second stage on the N.W. side. Pieces of polished alabaster and marble, with small pieces of pure gold and gold-headed copper nails, found on and about the top of the second stage, indicated that a small but richly adorned sacred chamber, apparently placed within or without, in gold, formerly crowned the top of this structure. Around the whole tower was a pavement of inscribed baked bricks, resting on a layer of clay 2 ft. thick. On the S.E. part of the terrace were the remains of several edifices. The remaining standing portion of the bricks identified the site as that of Eridu. Since Taylor's time the place has not been visited by any explorer, owing to the unsafe condition of the neighbourhood; but T. K. Loftus (1854) and J. P. Peters (1890) both report having seen it from the summit of Moghbir. The latter states that the Arabs at that time called the ruin Nowawis, and apparently no longer knew the name Abu-Sharheen. Through an error, in many recent maps and Assyriological publications Eridu is described as located in the alluvial plain, between the Tigris and the Euphrates. It was, in fact, an island city in an estuary of the Persian Gulf, stretching up into the Arabian plateau. Originally "on the shore of the sea," as the old records aver, it is now about 120 m. from the head of the Persian Gulf. Calculating from the present rate of deposit of alluvium at the head of that gulf, Eridu should have been founded as early as the seventh millennium B.C. It is probable, one of his oldest religious centres of the Sumerians, onward as late as the 6th century B.C. From the evidence of Taylor's excavations, it would seem that the site was abandoned about the close of the Babylonian period.

Jordan, The Ancient Civilization of Babylonia and Assyria (1888); H. V. Hilprecht, Excavations in Assyria and Babylonia (1904); L. W. King, A History of Sumer and Akkad (1910). (J. P. Pe.)
The large traffic on Lake Erie has existed since 700 A.D. and the number of important harbours on the south shore, nearly all artificially made and deepened, with entrances and breakwaters running into the lake at right angles to the coast line. The principal of these are Toledo, Sandusky, Huron, Vermilion, Lorain, Cleveland, Fairport, Ashtabula, Conneaut, Erie (a natural harbour), Dunkirk and Bufalo, Rondone, Port Stanley, Port Burwell, Port Dover, Port Maitland and Port Colborne. The Miami and Erie canal, leading from Maumee river to Cincinnati, 2444 m., with a branch to Port Jefferson, 12 m., with locks 90 by 15 by 4 ft., connects with Lake Erie through Toledo. The Welland canal, leading from Bufalo to Lake Ontario, 20 m., with locks 270 by 15 by 5 ft., connects with Lake Erie at Troy, and connecting with Lake Ontario at Oswego, had a capacity for boats 98 ft. long, 17 ft. 10 in. beam, with 6 ft. draught, until in 1907 the State of New York undertook its deepening to accommodate boats of 1000 tons capacity. Bufalo from its position at the eastern limit of deep draught lake navigation is a city of first rate commercial importance. Its harbour is formed by an artificial breakwater, built parallel with the shore about half a mile distant from it. It receives practically all the Lake Erie grain shipments besides large quantities of iron ore, lumber and copper, and is a large shipping port for coal, principally anthracite. It has over 600 m. of railway tracks to accommodate lake freights. The Welland canal, 261 m. long, connecting Lake Ontario and Lake Erie, with locks 270 by 45 by 14 ft., leaves Lake Erie at Port Colborne, where the Canadian government have constructed an artificial harbour and elevators for transshipment of grain from upper lake freighers to lighters of Lake Huron capacity.

Fishing operations are carried on extensively in Lake Erie, the fish being taken with gill nets, seines and pound nets. Each state touching the lake has its own fishery regulations, which differ amongst themselves as well as from those of the Dominion. Both nations maintain a Fishery Protection Service, and the fisheries are replenished from artificial hatcheries. The most numerous and valuable fish are the lesser white fish (Coregonus artes), Le Sueur's pickerel (Stizostedion vitreum,Walsh.), pike (Lucius lucius, L.), and white fish (Coregonus clupeiformis, Mitchell), in the order named. The fish caught are estimated to be worth annually $1,000,000. They are collected in fishing tugs and distributed by rail throughout the United States and Canada.

(Detroit, 1897); U.S. Hydrographic Office, Publication No. 108D, Sailing Directions for Lake Erie, &c. (Washington, 1902); Sailing Directions for the Canadian Shore of Lake Erie, Department of Marine and Fisheries (Ottawa, 1897); O. Curwoud, The Great Lakes (New York, 1856); E. Channing and M. F. Lansng, The Great Lakes (New York, 1899).

ERIE, a city, a port of entry, and the county-seat of Erie county, Pennsylvania, U.S.A., on Lake Erie, 148 m. by rail N. of Pittsburg and near the N. W. corner of the state. Pop. (1860) 40,634; (1900) 51,733, of whom 11,937 were foreign-born, including 5226 from Germany and 1468 from Ireland, and 2679 were of foreign parentage (both parents foreign-born), including 13,316 of German parentage and 4203 of Irish parentage; (1910 census) 66,525. Erie is served by the New York, Chicago & St Louis, the Lake Shore & Michigan Southern, the Erie & Pittsburg (Pennsylvania Company), the Philadelphia & Erie (Pennsylvania railway), and the Bessemer & Lake Erie railways, and by steamboat lines to many important lake ports. Erie extends over an area of about 7 sq. m., which in two parts is quite level and is from 30 to 175 ft. above the lake. Erie has a fine harbour about 4 m. in length, more than 1 m. in width, and with an average depth of about 20 ft.; it is nearly enclosed by Presque Isle, a long narrow strip of land of about 3000 acres from 300 ft. to 1 m. in width, and the national government has protected its entrance and deepened its channel by constructing two long breakwaters. Most of the streets of the city are 60 ft. wide—a few are 100 ft.—and nearly all intersect at right angles; they are paved with brick and asphalt, and many in the residential quarters are shaded with fine elms and maples. The city has four parks, in which a soldiers' and sailors' monument of granite and bronze, and not far away, along the shore of lake and park, are several attractive summer resorts. Among Erie's more prominent buildings are the United States government building, the city hall, the public library, and the county court house. The city's charitable institutions consist of two general hospitals, each of which has a training school for nurses; a municipal hospital, an orphan asylum, a home for the friendless, two old folks' homes, and a bureau of charities; here, also, on a bluff, within a large enclosure and overlooking both lake and city, is the state soldiers' and sailors' home. A fragment of the old Fort BUFFALO is near by; a monument erected to the memory of General Anthony Wayne, who died here on the 15th of December 1796.

Erie is the commercial centre of a large and rich grape-growing and agricultural district, has an extensive trade with the lake ports and by rail (chiefly in coal, iron ore, lumber and grain), and is an important manufacturing centre, among its products being iron, engines, boilers, brass castings, stoves, car heaters, flour, malt liquors, lumber, planing mill products, cooperation products, paper and wood pulp, cigars and other tobacco goods, gas meters, rubber goods, pipe organs, pianos and chemicals. In 1905 the city's factory products were valued at $10,911,567, the value of foundry and machine-shop products being $6,723,819, of flour and gist-mill products $1,444,450, and of malt liquors $852,403. The municipality owns and operates its water-works.

On the site of Erie the French erected Fort Presqu'Isle in 1753, and about it founded a village of a few hundred inhabitants. George Washington, on behalf of the governor of Virginia, came in the same year to Fort Le Boeuf (on the site of the present Waterford), 20 m. distant, to protest against the French fortifying this section of country. The protest, however, was unheeded. The village was abandoned in or before 1758, owing probably to an epidemic of smallpox, and the fort was abandoned in 1759. It was occupied by the British in 1760, but on the 22nd of June 1776 this was one of the several forts captured by the Indians during the Conspiracy of Pontiac. In 1764 the British regained nominal control and retained it until 1785, when it passed into the possession of the United States. The site was laid out as a town in 1795; in 1800 it became the county-seat of the newly-erected county of Erie; it was incorporated as a borough in 1805, the charter of that year being revised in 1833; and in 1851 it was incorporated as a city. At Erie were built within less than six months most of the vessels with which Commodore Oliver H. Perry won his naval victory over the British off Put-in-Bay in 1813.

ERIGENA, JOHANNES SCOTUS (c. 800-c. 877), medieval philosopher and theologian. His real name was Johannes Scotus (Scotus) or John the Scot. The combination Johannes Scotus Erigena has not been traced earlier than Ussher and Gale; even Gale uses it only in the heading of the version of St Maximus. The date of Erigena's birth is very uncertain, and there is no evidence to show definitely where he was born. The name Scotos, which has often been taken to imply Scottish origin, really favours the theory that he was an Irishman according to the then usage of Scotos or Scotia. Prudentius, bishop of Troyes, definitely states that he was of Irish extraction. The pseudonym commonly read Erigena, used by himself in the titles of his versions of Dionysius the Areopagite, is Ierugena (in later MSS. Erugena and Erugena), formed apparently on the analogy of Graugena ("Grecian-born"), which he applies to St Maximus. There seems no reason to doubt that Erigena is connected with Erin, the name for Ireland, and Ierugena suggests the Greek ἱερος, ἱερος <φωρα as a common name for Ireland. On the other hand, William of Malmsbury prefers to read Heruligena, which would make Scotus a Pannonian, while Bale says he was born at St David's, Dempster connects him with Ayr, and Gale with Eruiuen in Hereford. Some early writers thought there were two persons, John Scotus and John Erigena. In Erigena's early life nothing is known. Bale quotes the story that he travelled in Greece, Italy and Gaul, and studied
ERIGENA

not only Greek, but also Arabic and Chaldaean. Since, however, Ba
e describes him as "ex patricio genitore natus," it is a reason-
able inference (so R. L. Poole) that Bale confused him with one
John, the son of Patricius, a Spaniard, who tells much the
same story of his own travels. The knowledge of Greek displayed
in Erigena's works is not such as to compel us to conclude
that he had actually visited Greece. That he had a competent
acquaintance with Greek is manifest from his translations of
Diogenes the Areopagite and of Maximus, from the manner
in which he refers to Aristotle, and from his evident familiarity
with Neoplatonist writers and the fathers of the early church.
Roger Bacon, in his severe criticism on the ignorance of Greek
displayed by the most eminent scholastic writers, expressly
exempts Erigena, and ascribes to him a knowledge of Aristotle
in the original.

Among other legends which have at various times been attached
to Erigena are that he was invited to France by Charlemagne,
and that he was one of the founders of the university of Paris.
The only portion of Erigena's life as to which we possess accurate
information was that spent at the court of Charles the Bald.
Charles invited him to France soon after his accession to the
throne, probably in the year 843, and placed him at the head
of the court school (schola palatina). The reputation of this school
seems to have increased greatly under Erigena's leadership, and
the philosopher himself was treated with indulgence by the king.
Within the Mauricius's aura, who ascribes a role to him as illustrious both
the character of Scotus and the postition he occupied at the French
court. The king having asked, "Quid distat inter sottum et
Scotum?" Erigena replied, "Mensa tantum."

The first of the works known to have been written by Erigena
during this period was a treatise on the eucharist, which has not
come down to us (by some it has been identified with a treatise
by Ratinanus, De corfu et sanguine Dominii). In it he seems
to have advanced the doctrine that the eucharist is a symbol of
the sacrificial meal of the last supper. This was, however,
the only position Gerberans is said to have been compelled to burn
publicly Erigena's treatise. So far as we can learn, however,
Erigena's orthodoxy was not at the time suspected, and a few
years later he was selected by Hincmar, archbishop of Reims,
to defend the doctrine of liberty of will against the extreme
predestination of the monk Gottschalk (Gottschalchus). The treatise
De divina praedestinatione, composed on this occasion, has been preserved,
and from its general tenor one cannot be surprised that the author's orthodoxy was at once and
vehemently suspected. Erigena argues the question entirely
on speculative grounds, and starts with the bold affirmation
that philosophy and religion are fundamentally one and the same—
"Concilium in veram esse philosophiam veram religionem,
conversarium veram religionem esse veram philosophiam." Even
more significant is his handling of authority and reason, to
which we shall presently refer. The work was warmly assailed
by Drepianus Florus, canon of Lyons, and Prudentius, and was
condemned by two councils—that of Valence in 855, and that
of Langres in 859. By the former council his arguments were
described as Pulles Scotorum ("Scots porridge") and commentum
diabolici ("an invention of the devil").

Erigena's next work was a Latin translation of Dionysius the
Areopagite (see Dionysius Aegyptiacus) undertaken at the
request of Charles the Bald. This also has been preserved,
and fragments of a commentary by Erigena on Dionysius have been
discovered in MS. A translation of the Areopagite's pantheistic
writings was not likely to alter the opinion already formed as to
Erigena's orthodoxy. Pope Nicholas I. was offended that the
work had not been submitted for approval before being given
to the world, and ordered Charles to send Erigena to Rome, or
at least to dismiss him from his court. There is no evidence,
however, that this order was attended to.

The latter part of his life is involved in total obscurity. The
story that in 882 he was invited to Oxford by Alfred the Great,
that he laboured there for many years, became abbot at Malmes-
bury, and was stabbed to death by his pupils with their "styles",
is apparently without any satisfactory foundation, and doubtless
refers to some other Johannes. Erigena in all probability never
left France, and Hauréau has advanced some reasons for fixing
the date of his death about 877.

Erigena is the most interesting figure among the middle-age
writers. The freedom of his speculation, and the boldness with
which he works out his logical or dialectical system of the universe,
altogether prevent us from classing him along with the scholastics
whom we so often so call. His works, indeed, are the manifesta-
tion of a spirit which is more Platonicizing philosophy to the later and more rigid
scholasticism. In no sense whatever can it be affirmed that with
Erigena philosophy is in the service of theology. The above-
quoted assertion as to the substantial identity between philo-
sophy and religion is indeed repeated almost logeten verba from
many of the later scholastic writers, but its significance altogether
depends upon the selection of one or other term of the identity
as fundamental or primary. Now there is no possibility of mis-
taking Erigena's position: to him philosophy or reason is
first, is primitive; authority or religion is secondary, derived.
"Auctoritas siquidem ex vera ratione processit, ratio vero
necessam ex auctoritate. Omnis enim auctoritas, quae vera
ratione non approbat, infirma videtur esse. Vera autem ratio,
quum virtutibus suis rata atque immutabilis munimentum, nullius
auctoritatis adstipulationes roborarit indiget. (De divisione
naturae, l. 71). F. D. Maurice, the only historian of note who
has attempted a biography of Erigena, does not attempt to answer
the question by the manner in which he states it. He asks his
readers, after weighing the evidence advanced, to determine
whether he (Erigena) used his philosophy to explain away his
theology, or to bring out what he conceived to be the fullest
meaning of it. These alternatives seem to be wrongly put.
"Explaining away theology" is something wholly foreign to
the philosophy of that age; and even if we accept the alterna-
tives he offers, and are to be explained by reference to it: for
the meaning of theology, we are by no means driven to the conclusion
that he was primarily or principally a theologian. He does not
start with the datum of theology as the completed body of truth,
requiring only elucidation and interpretation; his fundamental
thought is that of the universe, nature, rò wò, or God, as the
ultimate unity which works itself out into the rational system
of the world. Man and all that concerns man are but parts of
resemblance, and are to be explained by reference to it. The
explanation or understanding of a thing is determination of its place
in the universal or all. Religion or revelation is one element or
factor in the divine process, a stage or phase of the ultimate
rational life. The highest faculty of man, reason, intellec-
tus, intellectus visio is that which is not content with the individual
or partial, but grasps the whole and thereby comprehends the
parts. In this highest effort of reason, which is indeed God
thinking in man, thought and being are at one, the opposition
of being and thought is overcome. When Erigena starts with such
propositions, it is clearly impossible to understand his position
and work if we insist on regarding him as a scholastic, accepting
the dogmas of the church as ultimate data, and endeavouring only
to present them in due order and defend them by argument.

Erigena's great work, De divisione naturae, which was condemned
by a council at Sens, by Hauréau H. (1242), who described it as
"swarming with worms of the old perversion of the XIII.
in 859, is arranged in five books. The form of exposition is
that of dialogue; the method of reasoning is the syllogistic.
The leading thoughts are the following: Natura is the name for the
universal, the totality of all things, containing in itself being and
non-being. It is the unity of which all special phenomena are
manifestations. But of this nature there are four distinct classes—
(1) that which creates and is not created; (2) that which is created
and creates; (3) that which is created and does not create; (4)
that which neither is created nor creates. The first is God as the
principle or origin of all things; the second is God as the creator
or goal of all things, that into which the world of created things ultimately
returns. The second and third together compose the created uni-
verse, which is the manifestation of God, God is process, The-
ophoria. Thus we distinguish in the divine system beginning, middle
and end; but these three are in essence one—the difference is only
the consequence of our finite comprehension. We are compelled
to envisage this eternal process under the form of time, to apply
temporal distinctions to that which is extra- or supra-temporal.
ERIGONE—ERINNA

The universe of created things, as we have seen, is twofold—first, that which is created and creates—by moral ideas, archetypes, immutable relations, divine acts of will, according to which individual things are formed; second, that which is created and does not create, the created, by its creation. And it is through these immoral causes, for which the causes have no true being. Created things have no individual or self-independent existence; they are only in God; and each thing is a manifestation of the divine, theophaonia, divina natura.

God alone, the uncreated creator of all, has true being. He is the true universal, all-containing and incomprehensible. The lower cannot contain the higher, and the higher cannot be contained by the lower. Hence we must assume the existence of God is above being, above essence; God is above goodness, above wisdom, above truth. No finite predicates can be applied to him; his mode of being cannot be determined by predicate. Nevertheless, as God is the highest, as the theophaonia, the revelation of God, enables us so far to understand the divine essence. We recognize his being in the being of all things, his wisdom in their orderly arrangement, his life in their constant motion. Thus God is for us a Trinity—the Father as substance or being (οὐσία), the Son as wisdom (σοφία), the Spirit as life (ζωή).

These three are realized in the universe—the universe of being, the Son as the word, i.e., the term of ideas, the Spirit as the life or moving force which introduces individuality and which ultimately draws back all things into the divine unity. In man, as the noblest of the created things, the Trinity is seen most perfectly reflected: intellectus (νοῦς), ratio (δίκης) and sensus (σώνοια) make up the threefold thread of his being. Not in man alone, but in all things, God is to be regarded as reality itself, as becoming incarnate.

The infinite essence of God, which may indeed be described as nihil (nothing) is that from which all is created, from which all proceeds. The first production or emanation, as indicated, is the realm of ideas in the Platonic sense, the word or wisdom of God. These ideas compose a whole or inseparable unity in a dim world of which we think of them as logically arranged. Thus the highest idea is that of goodness; things are, only if they are good; being without well-being is naught. Essence participates in goodness—that which is good has being, and that which is good is a species of good. God is a species of essence, wisdom a species of life, and so on, always descending from genus to species in a rigorous logical fashion.

The formal cause, as we have already said, is the world of ideas, and the principles of the universe, the spirit, manifest themselves in their effects, the individual created things. Manifestation, however, is part of the being or essence of the causes, that is to say, if we interpret the expression, God of necessity manifests himself in the world and is not without the world. Further, as the causes are eternal, timeless, so creation is eternal, timeless. The Mosaic account, then, is to be looked upon merely as a mode in which is faintly shadowed forth what is above finite comprehension. It is altogether allegorical, and requires to be interpreted. Paradise and the Fall have no local or temporal being. Man was originally solitary and the act of division is not only after the introduction of sin did man lose his spiritual body, and acquire the animal nature with its distinction of sex. Woman is the impersonation of man's sensuous and fallen nature. The return to the original state, division, distinction of sex will vanish, and the spiritual body will be regained.

The most remarkable and at the same time the most obscure portion of the story is that in which the final return to God is described. Naturally sin is a necessary preliminary to this redemption, and Erigone has the greatest difficulty in accounting for the fact of sin. If God is true being, then sin can have no substantive existence; it cannot be said that God knows of sin, for to God knowing and being are one. In the universe of things, as a universe, there can be no sin; there must be perfect harmony. Sin, in fact, results from the will of the individual who falsely represents something as good which is not so. This misdirected will is punished by finding that the objects after which it thirsts are in truth vanity and empti- ness. Hence it may be regarded as having lost existence, it is the inner state of the sinful will. As the object of punishment is not the will or the individual himself, but the misdirection of the will, so the result of punishment is the final purification and redemption of the inner or hidden devil. All, however, is not saved at once; the stages of the return to the final unity, corresponding to the stages in the creative process, are numerous, and are passed through in the course of the universal goal is definiteness, resumption into the divine being, when the individual soul is raised to a full knowledge of God, and where knowing and being are one. After all have been restored to the divine unity, there is no further creation.

The ultimate unity is that which neither is created nor creates.

EDITIONS.—There is a complete edition of Erigone's works in J. H. J. J. Flos (Paris, 1853). The De divina praedestinatione was published in Gilbert Mauguin's Veterum auctorum qui non sacro de praedestinatione et gratia scriptorum operi et fragmentis (Paris, 1659). The Erigone's other works ("Diaries") on Dionysus are catalogued in the archive coelestis appeared in the Appendix ad opera edita ab A. Mai (ed. J. Cozza, Rome, 1871). Of the De divisione naturae, editions have been published by Thomas Gale (Oxford, 1681); C. B. Schlüter (Münster, 1838); and in Pluon's Opera omnia; there is a German translation by Ludwig Noack, Johannes Scoto Erigonea über die Einheit der Natur (3 vols., 1874-1876). Erigone was also the candidate for the post of archdeacon of Maastricht in the German church. Petrus Latino aen Carolini, iii. (1896). A commentary on the Opuscula sacra of Boëtius is attributed to him and edited by E. K. Rand (1906). Monographs on Erigone's life and works are found in see Scoto Erigone, see Scot Rustici, see Scot Erigone, see Scot Erigone, see Scot Erigone, see Scot Erigone, see Scot Erigone, see Scot Erigone, see Scot Erigone, see Scot Erigone, see Scot Erigone (Prague, 1860); A. Stöckl, De Joh. Scoti Erigone (1867); L. Noack, Uber Leben und Schriften des Joh. Scoti Erigone (Munich, 1863); W. Trabant, Johannese Scoti Erigoni (Leipzig, 1876); R. L. Poole, Medieval Thought (1884), and Richard Quine, A Biographical Dictionary. T. Wotschke, Fichte and Erigone (Halle, 1866); M. Baumgartner in Weltey and Welte's Kirchenlexikon, x. (1867); Alice Gardner's Studies in John the Scot (1901); J. Drikel, L. Joh. Scoti Erigone und seine Gewährsmänner (Leipzig, 1902); S. M. Deutsch in Herzog-Hauff's Realencyklopädie für protestantische Theologie, xviii. (1906); J. E. Sandys, Hist. of Classical Scholarship (1906), pp. 495-496. See also the general works on scholastic philosophy, especially Hauréau, Stöckl and Kaulich. An admirable résumé is given by F. D. Maurice, Medieval Phil. pp. 45-73. (R. A.); J. M. M.)

ERIGONE, in Greek mythology, daughter of Icarius, the hero of the Attic deme Icaria. Her father, who had been taught by Dionysus to make wine, gave some to some shepherds, who were then so intoxicated they thought they had been poisoned, killed Icarius and buried him in the compound of a pretentious Hyemnus (or threw his body into a well). Erigone, guided by her faithful dog Maera, found his grave, and hanged herself on the tree. Dionysus sent a plague on the land, and all the maidens of Athens, in a fit of madness, hanged themselves like Erigone. Icarius, Erigone and Maera were set among the stars as Boötis (or Arcturus), Virgo and Procynus. The festival called Aeris (the "waving") was subsequently instituted to propitiate Icarius and Erigone. Various small images (in Lat. ossa) were suspended on trees and swung backwards and forwards, and offerings of fruit were made (Hyginus, Fab. 132. Poll. astron. ii. 4; Apollodorus iii. 14). The story was probably intended to explain the origin of these oscilla, by which Dionysus, as god of trees (Dendrites), was propitiated, and the baneful influence of the dog-star averted (see also Ossilla).

ERIN, an ancient name for Ireland. The oldest form of the word is Erin, of which Erin is the native case. Erin was itself almost certainly a contraction from a still more primitive form Ibarious or Iearious; for when the name of the island was written in ancient Greek it appeared as I'evpia (Ivernia), and in Latin as Iberia, Hibetia or Hibetria, the first syllable of the word Erin being thus represented in the classical languages by two distinct vowel sounds separated by a grave or. Of the Latin variants, Iberia is the form found in the most ancient Irish MSS., such as the Book of St Patrick, and in the Sinaitica. Further evidence to the same effect is found in the fact that the ancient Breton and Welsh names for Ireland were Ywerddon or Iwerdon. In later Gaelic literature the primitive form Æiri became the disyllabic Erin; hence the Norsemen called the island the land of Eire, i.e. Ireland, the latter word being originally pronounced in three syllables. (See Ireland: Notices of Ireland in Greek and Roman writers.): Nothing is known as to the meaning of the word in any of its forms, and Whitley Stokes's theory that it may have been connected with the word Ævar, meaning "western." is admittedly no more conjectural. There was, indeed, a native Irish legend, worthless from the standpoint of etymology, to account for the origin of the name. According to this myth there were three kings of the Dedannans reigning in Ireland at the coming of the Milesians, named MacColl, MacKeich and MacGrena. The wife of the first was Eire, and from her the name of the country was derived. Ireland in ancient poetry is called "Fodla" or "Bauba," and these were the wives of the other two kings in the legend.

ERINNA, Greek poet, contemporary and friend of Sappho, a native of Rhodes or the adjacent island of Telos, flourished about 600 (according to Eusebius, 350 B.C.). Although she died at the early age of nineteen, her poems were among the most
famous of her time and considered to rank with those of Homer. Of her best-known poem, Ἰθάκηρ (the Ithaca), written in a mixture of Attic and Doric, which contains five Greek hexameters and only 4 lines are now extant. Three epigrams in the Paean anthology, also ascribed to her, probably belong to a later date.

The fragments have been edited (with those of Alcaeus) by J. Pellegrino (1894).

ERINYES (Lat. Furiae), in Greek mythology, the avenging deities, properly the angry goddesses or goddesses of the curse pronounced upon evil-doers. According to Hesiod (Theog. 185) they were the daughters of Earth, and sprang from the blood of Tityus, father of Uranus; in Aeschylus (Prom. 171), they are the daughters of Night, in Sophocles (O.C. 109) of Darkness and Earth. Sometimes one Erinys is mentioned, sometimes several; Euripides first spoke of them as three in number, to whom later Alexandrian writers gave the names Alecto (unceasing in anger), Tisiphone (avenger of murder), Megasera (jealous). Their home is the world below, whence they ascend to earth to pursue the wicked. They punish all offences against the laws of human society, such as perjury, violation of the rites of hospitality, and, above all, the murder of relations. But they are not without benevolent and beneficent attributes. When the sinner has expiated his crime they are ready to forgive. Thus, their persecution of Orestes ceases after his acquittal by the Areopagus. It is said that on this occasion they were first called Eumenides ("the kindly"), a euphemistic variant of their real name. At Athens, however, where they had a sanctuary at the foot of the Areopagus, their sacred grove at Colonus, their regular name was Semnai (venerable). Black sheep were sacrificed to them during the night by the light of torches. A festival was held in their honour every year, superintended by a special priesthood, at which the offerings consisted of milk and honey mixed with water, but no wine. In Asclepius, the Erinys are represented as awful, Gorgon-like women, wearing long black robes, with snaky locks, bloodshot eyes and claw-like nails. Later, they were winged maidens of serious aspect, in the garb of huntresses, with snakes or torches in their hair, carrying scorpions, torches or sickles. The identification of Erinys with Sanskrit Sārṇānyu, the swift-speeding storm cloud, is rejected by modern etymologists; according to M. Bréal, the Erinys are the personification of the formule of imprecation (ἀπέλευθερον), while E. Rohde sees in them the spirits of the dead, the angry souls of murdered men.

See C. O. Müller, Dissertations on the Eumenides of Aeschylus, (Eng. tr., 1835); A. Rosenberg, Die Erinys (1874); J. E. Harrison, Prolegomena A to the Study of Greek Religion (1898); and Homeric Studies, xix. p. 205, according to whom the Erinys were primarily local ancestral ghosts, potent for good or evil after death, earth-spirits, conceived as female in the form of women, whose primitive haunt and sanctuary was the omphalos at Delphi; E. Rohde, Psyche (1903); A. Rapp in Roscher’s Lexicon der Mythologie (1851); A. A. Darmeng and Saglio’s Dictionnaire des antiquités, u. v. Furiae.

EPIRYPHILE, in Greek mythology, sister of Adrastus and wife of Amphiarous. Having been bribed by Polyneices with the necklace of Harmonia, she persuaded her husband to take part in the expedition of the Seven against Thebes, although he knew it would prove fatal to him. Before setting out, the seer charged his sons to slay their mother as soon as they heard of his death. The attack on Thebes was repulsed, and during the flight the earth opened and swallowed up Amphiarous together with his chariot. His son Alcmaeon, as he had been hidden, slew his mother, and was driven from place to place by the Erinys, seeking purification and a new home (Apollodorus ii. 6. 7).

ERIS, in Greek mythology, a sister of the war-god Ares (Homer, Illiad, iv. 440), and in the Hesiodic theogony (225) a daughter of Night. In the later legends of the Trojan War, Eris, not having been invited to the marriage festival of Peleus and Thetis, flings a golden apple (the "apple of discord") among the guests, to be given to the most beautiful. The claims of the three deities Hera, Aphrodite and Athena are decided by Paris in favour of Aphrodite in order to gain possession of Helen (Hyginus, Fab. 92; Lucian, Chadidemus, 17). Hesiod also mentions (W. and D. 24) a beneficent Eris, the personification of honourable rivalry. In Virgil (Aenid, vii. 702) and other Roman poets Eris is represented by Discordia.

ERITRA, an urban district in the north-western parliamentary division of Kent, England, 14 m. E. by S. of London, on the South Eastern & Chatham railway. Pop. (1891) 13,414; (1901) 25,206. It lies on the south bank of the Thames and extends up the hills above the shore, many villas having been erected on the higher ground. The park of a former seat, Belvedere, was thus built over (c. 1560), and the mansion became a home for disabled seamen. The church of St John the Baptist, though largely altered by modern restoration, retains its Early English to Decorated portions, and some early monuments and memorials. Erith has large engineering and gun factories, and in the neighbourhood is gunpowder, oil, glue and manure works. The southern outfall works of the London main drainage system are at Croessness in the neighbouring lowland called Plumstead Marshes. Erith is the headquarters of several yacht clubs. Erith, the name of which is commonly derived from A.S. Erê-hyrfe (old haven), was ancyently a borough, and was granted a market and fairs in 1313. Down to the close of the 17th century it was of some importance as a naval station.

ERITREA, an Italian colony on the African coast of the Red Sea. It extends from Ras Kasar, a cape 110 m. S. of Suakin, in 18° 2' N., as far as Ras Dumeira (12° 42' N.), in the Strait of Bab-el-Mandeb, a coast-line of about 650 m. The colony is bounded inland by the Anglo-Egyptian Sudan, Abyssinia and French Somaliland. It consists of the coast lands lying between the extremities of the northern and southern Abyssinian plateau. The total area is about 60,000 sq. The population is approximately 450,000, of which, exclusive of soldiers, not more than 3000 are whites.

The land frontier starting from Ras Kasar runs in a south-westerly direction until in about 14° 15' N., 30° 35' E. it reaches the river Setit, some distance above the junction of that stream with the Abbara. This, the farthest point inland, is 138 m. S.W. of Massawa. The frontier runs thence in a NE. direction for a short distance the course of the river Setit; thence it runs north-easterly to the Mareb, and from 38° E. follows that river and its tributaries the Belessa and Muna, until within 42 m. of the sea directly south of Annesley Bay. At this point the frontier runs south and east, crossing the Afar or Danakil country at a distance of 60 kilometres (37-28 m.) from the coast-line. About 12° 20' N. the French possessions in Somaliland are reached. Here the frontier turns N.E. and so continues until the coast of the Red Sea is reached. It then runs south and east to the city of Massawa.

In the southern part of the colony are the small sultanates, such as those of Aussa and Rabeita, which are under Italian protection. The Dahlak archipelago and other groups of islands along the coast belong to Eritrea.

Physical Features.—The coast-line is of coral formation and is, in the neighbourhood of Massawa, thickly studded with small islands. The chief indentations are Annesley Bay, immediately south of Massawa, and Assab Bay in the south. The colony consists of two widely differing regions. The northern division is part of the Abyssinian highlands. The southern division, part of the Afar or Danakil country, includes all the territory of the colony south of Annesley Bay. These two regions are connected by a narrow strip of land behind Annesley Bay, where the Abyssinian hills approach close to the sea. From this bay the coast-line trends S.E. so that at Tajura Bay the distance between the Abyssinian hills and the sea is over 200 m. The Afar country is part of the East African rift-valley, and in the southern parts of the valley its surface is diversified by ranges of hills, frequently volcanic, and by lakes. The plains, however, extend over large areas, they are generally arid and are often covered with mimosa trees which form a kind of desert. Watered by the native streams the region is not without good pasture. The torrents which descend from the Abyssinian plateau usually fail to reach the sea. They are mostly bordered by dense vegetation; in the dry season water is found in the river beds or obtained by digging deep wells. Some rivers enter and are lost in one or other of two salt plains or basins, that of Assai in the north and that of Aussa in the south. The Harwah flows through the Aussa country in a N.E. direction, but is lost in lakes Alabchad and Aqteh (see ABBYSSINIA). Some small and other rivers drain into the Asali basin. This basin, like that of Aussa, is in places 200 ft. below sea-level. On the west the Asali basin is bounded by the Arabian foot-hills; in the southeast part is the small lake Alabchad. The eastern edge of the basin is formed by a
ETRITREA

740

ridge of gypsum and on its margin grow palms. In parts the salt lies thick on the plain, which then has the appearance of a lake frozen over. South of Lake Abébad is a volcano called Arthali or Ertirea; its Assa (or Eddeh), and north of Lake Assa, the peak of Aldera, which was in eruption in June 1907. The hills, 1000 to 4000 ft. in height, which run more or less parallel to the coast, form the backbone of the country. The town of Dubbi (1861), some 30 m. S. of the port of Eddi (Eddeh). In 4° 12' N., 39° 53' E. and near the northern end of the zone of depression the volcano of Alid (1865 ft.) rises from the trough. Its chief characteristic is an elongated ring wall, which encloses a cauldron 8 miles in diameter and with walls 330 ft. high. North and south of Alid extends a vast lava field. Dubbi and Alid are in Italian territory. An aerial survey of Massawa, conducted by the Italian government in 1907, the coast in the interior is Asmara (gez), the capital of the colony and under the Abyssinians capital of the province of Eritrea. Massawa lies on the road from Keren to Assab, is the centre of the Beni-Amer, Algerien and Sabderat tribes; Mogolo, on the lower Mareb, is the rendezvous of Habesha and Assab and of the province of Saganet (capital of the Koke-Kusi province). Gofelefas and Aidi-Ugri, the two latter situated in the fertile plain of the Serae; Adiquala, on the edge of the Mareb gorge; and Arrasa, the capital of the district of Assab, which has a general post-office. Aids is almost all European cereals flourish in the intermediate zone and on the high plateau, and the Abyssinian is a good agriculturist and understands irrigation. Numbers of emigrants from Italy live on the farms on the plateau. Experiments in the cultivation of coffee, tobacco and cotton have given good results in the intermediate zone. Besides camels and oxen, sheep and goats are numerous, and most hides and butter are articles of trade. Hides are the principal export (about £50,000 a year). Wax, gum, coffee and ivory are also exported. Pearl fishing is carried on at Assab and Massawa. The annual yield of fish is about £400,000 (pearls £40,000, mother of pearl £360,000). Gold mines are worked near Assma. Salt, obtained from the salt lakes in the Assa and Danakul countries, is a valuable article of commerce. Commerce.—Exports. Cotton and hides. Imports are tobacco, iron, sugar and iron. Communication.—A railway, 65 m. long, connects Massawa with Assab. An extension of the line is planned from Assab to Melak and Kassala. The whole territory is crossed by camel and mule paths between the sea and the high plateau, and between the various centres of population. Every valley that brings water to the Red Sea has a route leading to the high plateau. The great northern road runs by way of Assma, run, two to Assab, and one to Kassala and Khartum. They are all more or less practicable for carts, and are flanked by a good telegraph line as long as they lie in Italian territory. There are also two caravan routes from Assab Bay, across the Danakul country to southern Abyssinia. The northern leads by a comparatively easy ascent to Yeju, the more southern follows the valley of the Hawwah. A telegraph line 500 m. long connects Massawa with Adis Ababa via Assab. Massawa is also telegraphically connected with the outside world by a cable to Perim which is owned by the Perim Company and Mr. Persoo, where it is joined by another cable to Assab. Communications.—Eritre is administered by a civil governor responsible to the ministry of foreign affairs at Rome. It is divided into several provinces, of which the most important are:

_Administration._—Eritrea is administered by a civil governor responsible to the ministry of foreign affairs at Rome. It is divided into several provinces, of which the most important are:

inent inhabitants. The inhabitants of the plains and foothills are for the most part semi-nomad shepherds, living on dura and milk. In the north these people are largely of the nomadic Arab or Hamitic tribes, but include various negro tribes. Afar and Somail form the population of the southern regions. The inhabitants of the plateau are Abyssinians. The nomads are Musulmans and are divided into distinct tribes, of which the most important are the Danakil, the Awale, and the Danakul. The latter have the privilege of occasional raiding. The Abyssinians are more warlike, but they have settled down under Italian rule. Among the native industries are mat-weaving, cotton-weaving, all sorts of iron working and leather working. (See _Afrass, Somail_ and Abyssinias.)

Towns.—The principal places on the coast are Massawa (gez.), pop. about 10,000, the chief seaport of the colony, Assab, chief town of the Danakil region, to which converges the trade from Abyssinia and Somaliland. The chief town of the province of Assab is Massawa (gez.), the capital of the colony and under the Abyssinians capital of the province of Eritrea. Assab lies on the road from Keren to Assab, is the centre of the Beni-Amer, Algerien and Sabderat tribes; Mogolo, on the lower Mareb, is the rendezvous of Habesha and Assab and of the province of Saganet (capital of the Koke-Kusi province). Godofelas and Aidi-Ugri, the two latter situated in the fertile plain of the Serae; Adiquala, on the edge of the Mareb gorge; and Arrasa, the capital of the district of Assab, which has a general post-office.
time protest. In 1875 and 1876 the Egyptians, who sought to increase their conquests, were defeated by the Abyssinians at Gundet and Gura. Walad Michael, the hereditary ruler of Bogos, fought as ally of King John at Gundet and of the Egyptians at Gura. For two years Walad Michael continued to maintain the Egyptian border, but in December 1878 he submitted to King John, by whose orders he was (Sept. 1879) imprisoned upon an amba, or flat-topped mountain, whence he only succeeded in escaping in 1890. In 1879 his territory was given by King John to Ras Alula, who retained it until, in August 1880, the Italians occupied Asmara (see ABBYSSINIA: History).

An Egyptian garrison remained at Keren in the Bogos country until 1882, after the revolt of the Mabiti it was withdrawn, Bogos being occupied by Abyssinia on the 12th of September of that year. On the 5th of February 1885 an Italian force, with the approval of Great Britain, occupied Massawa, the Egyptian garrison returning to Egypt. This occupation led to wars with Abyssinia and finally to the establishment of the colony in its present limits. The history of the Italian-Abyssinian relations is fully told in the articles ITALY and ABBYSSINIA (history sections).

It was not, however, at Massawa that Italy first obtained a foothold in eastern Africa. The completion of the Suez Canal led Italy as well as Great Britain and France to seek territorial rights on the Red Sea coasts. The purchase of Assab and the neighbouring region for £1880, from the sultan Berehan of Raheita for use as a coaling station by the Italian Rubattino Steamship Company, in March 1870, formed the nucleus of Italy's colonial possessions. This purchase was protested against by Egypt, Turkey and Great Britain; the last named power being unwilling to recognize an Italian commercial settlement, but nothing more. (The Indian government viewed the establishment of the Italians on the new highway to the East with a good deal of ill-humour.) Eventually, the British opposition being overcome and that of Egypt and Turkey disregarded, Assab, by a decree of the 4th of July 1883, was declared an Italian colony. Between 1883 and 1888 various treaties were concluded with the sultan of Aussa ceding the Danakil coast to Italy and recognizing an Italian protectorate over the whole of his country—through which passes the trade route from Assab Bay to Shoa.

On the 1st of January 1890 the various Italian possessions on the coast of the Red Sea were united by royal decree into one province under the title of the Colony of Eritrea—so named after the Erythraeum Mare of the Romans. At first the government of the colony was purely military, but after the defeat of the Italians by the Abyssinians at Adowa, the administration was placed in the hands of a witnessed with an Italian civil basin of the old Emirate. After the rise of the Ethiopian empire the history of Eritrea is bound up with that of Ethiopia, but not so entirely as to be completely fused. The documents of the Portuguese expeditions of the 16th century and other Ethiopian records show that all the country north of the Mareb enjoyed relative autonomy under a vassal of the Ethiopian emperor.

Michael, counsellor of Solomon, who was king of the country north of the Mareb, usurped the throne of Solomon during the reign of the Emperor Ataaf I. (1733-1753), and, after proclaiming himself ras of Tigré and protector of the empire, ceded the North Mareb country to an enemy of the rightful dynasty. Hence a long struggle between the dispossessed family and the occupants of the North Mareb throne. The coast regions had meantime passed from the control of the Abyssinians. In the 16th century the Turks made themselves masters of Zula, Massawa, &c., and these places were never recovered by the Abyssinians. Massawa and the neighbouring coast was acquired by Egypt, the khedive Ismail entertaining projects for connecting the port by railway with the Nile. The Egyptians took advantage of civil war in Abyssinia to seize Keren and the Bogos country in 1873, an action which against the negus Johannes (King John), newly come to the throne, did not at the time
1900, and for climate an article in *Rivista coloniale* (1906), by A. Tancredi. A. Allori compiled a Piccolo Dizionario eretto, italiano-arabo-americano (Milan, 1895).

Bibliographies will be found in G. Fumagalli’s *Bibliografia Etiopica* (Milan, 1905) and in the *Riv. Geog. Italiana* for 1907.

**ERIVAN,** a government of Russia, Transcaucasia, having the province of Kars on the W., the government of Tiflis on the N., that of Elisavetpol on the N. and E., and Persia and Turkish Armenia on the S. It occupies the top of an immense plateau (6000-8000 ft.). Continuous chains of mountains are met with only on its borders, and in the E., but the whole surface is thickly set with short ridges and isolated mountains of volcanic origin, of which Alagöz (14,440 ft.) and Ararat (16,925 ft.) are the most conspicuous and the most important. Both must have been active in Tertiary times. Lake Gok-chîa (350 sq. m.) is encircled by such volcanoes, and the neighbourhood of Alexandropol is a "volcanic amphitheatre," being entirely buried under volcanic deposits. The same is true of the slopes leading down to the river Aras; and the valley of the upper Aras is a stony desert, watered only by irrigation ditches dug according to the character of the soil. The government is drained by the Aras, which forms the boundary with Persia and flows with great velocity down its stony bed, the fall being 17-22 ft. per mile in its upper course, and 9 ft. at Ondruba, where it quits the government, while lower down it again increases to 23 ft. Many of the small lakes, filling volcanic craters, are of great depth. Timber is very scarce. A variety of useful minerals exists, but only rock-salt is obtained, at Nakhichevan and Kulp. The climate is extremely varied, the following being the average temperatures and mean annual rainfall at Alexandropol (alt. 5978 ft.) and Aralik (2755 ft.) respectively: year 42°, January 12°, July 65°, mean rainfall 16-2 in.; and year 53°, January 20°-5, July 70°, rainfall 6-3 in. The population numbered 829,578 in 1897 (only 375,086 women), of whom 82,278 lived in the towns. An estimate in 1906 gave a total of 909,100. They consist chiefly of Armenians (441,000), Tatars (20%), Kurds (40,859), with Russians, Greeks and Tatars. Most of the Armenians belong to the Gregorian (Christian) Church, and only 4020 to the Armenian Catholic Church. The Tatars are mostly Shitte Musulmans, only 27,596 being Sunnites; 7772 belong to the peculiar faith of the Yezidis. While barley only can be grown on the high parts of the plateau, cotton, mulberry, vines and all sorts of fruit are cultivated in the valley of the Aras. Cattle-breeding is extensively carried on; camels also are bred, and leeches are collected out of the swamps and exported to Persia. In winter the better inhabited regions are inlaid with carpets, but coarse, carpets, and felt goods are made in the villages. A considerable trade is carried on with Persia, but trade with Asia Minor is declining. The government is divided into seven districts—Erevan, Alexandropol, Echmiadzin (chief town, Vagarshapat), Nakhichevan, Novobavazet, Surmali (chief town, Igadyr), and Sharur-daralagöz (chief town, Norashen). The principal towns are Erevan (see below), Alexandropol (32,018 inhabitants in 1897), Novobavazet (8507), Nakhichevan (8843), and Vagarshapat (3400).

**ERIVAN,** or ERIVAN, in Persian, Perwan, a town of Russia, capital of the government of the same name, situated in 40° 14' N., 44° 38' E., 234 m. by rail S.S.W. of Tiflis, on the Zanga river, from which a great number of irrigation canals are drawn. Altitude, 3170 ft. Pop. (1873) 11,038; (1897) 29,033. The old Persian portion of the town consists mainly of narrow crooked lanes enclosed by mud walls, which effectually conceal the houses, and is protected by a high wall, which is made by him on the great streets. On a steep rock, rising about 600 ft. above the river, stands the ruins of the 16th-century Turkish fortress, containing part of the palace of the former Persian governors, a handsome but greatly dilapidated mosque, a modern Greek church and a cannons foundry. One chamber, called the Hall of the Sardar, one besawares to former splendor in its decorations. The finest building in the city is the mosque of Hussein Ali Khan, familiarly known as the Blue Mosque from the colour of the enamelled tiles with which it is richly encased. At the mosque of Zal Khan a passion play is performed yearly illustrative of the assassination of Hussein, the son of Ali. Erevan is an Armenian episcopal see, and has a theological seminary. The only manufactures are a little cotton cloth, leather, earthenware and blacksmiths' work. The fruits of the district are noted for their excellence—especially the grapes, apples, apricots and melons. Armenians, Persians and Tatars are the principal elements in the population, besides some Russians and Greeks. The town fell into the power of the Turks in 1582, was taken by the Persians under Shah Abbas in 1604, besieged by the Turks for four months in 1615, and reconquered by the Persians under Nadir Shah in the 18th century. In 1780 it was successfully defended against Heracleus, prince of Georgia; and in 1804 it resisted the Russians. At length in 1827 Paskevich took the fortress by storm, and in the following year the town and government were ceded to Russia by the peace of Turkman-châi. A Tatar poem in celebration of the event has been preserved by the Austrian poet, Bodenstedt, in his *Tausend und ein Tag im Orient* (1850).

**ERLANGEN,** a town of Germany, in the kingdom of Bavaria, on a fertile plain, at the confluence of the Schwabach and the Regnitz, 13 m. N.W. of Nuremberg, on the railway from Munich to Nuremberg. Pop. (1890) 12,790; (1900) 15,520. It is divided into an old town and a new town, the latter consisting of wide, straight and well-built streets. The market place is a fine square. Upon it stand the town-hall and the former palace of the margraves of Bayreuth, now the main building of the university. The latter was founded by the margrave Frederick (d. 1763), who, in 1742, established a university at Bayreuth, but in 1743 removed it to Erlangen. A statue of the founder, erected in 1843 by King Louis I. of Bavaria, stands in the centre of the square and faces the university buildings. The university has faculties of philosophy, law, medicine and Protestant theology. Connected with it are a library of over 200,000 volumes, geological, anatomical and mineralogical institutions, a hospital, several clinical establishments, laboratories and a botanical garden. Among the churches of the town (six Protestant and one Roman Catholic), only the new town church, with a spire 220 ft. high, is remarkable. The chief industries of Erlangen are spinning and weaving, and the manufacture of glass, paper, brushes and gloves. The brewing industry is also important. The beer of Erlangen being famous throughout Germany and large quantities being exported.

Erlangen owes the foundation of its prosperity chiefly to the French Protestant refugees who settled here on the revocation of the edict of Nantes and introduced various manufactures. In 1717 the place was transferred from the bishrophric of Würzburg to that of Bamberg. In 1803 it was sold to the king of Bohemia. It became a town in 1398 and passed into the hands of the Hohenzollerns, burgovars of Nuremberg, in 1416. There for nearly three centuries it was the property of the margraves of Bayreuth, being ceded with the rest of Bayreuth to Prussia in 1791. In 1810 it came into the possession of Bavaria. Erlangen was for many years the residence of the poet Friedrich Rückert, and of the philosophers Johann Gottlieb Fichte and Friedrich Wilhelm von Schelling.

See Stein and Müller, *Die Geschichte von Erlangen* (1898).

**ERLE, SIR WILLIAM** (1795-1880), English lawyer and judge, was born at Fifhead-Magdalen, Dorset, on the 1st of October 1793, and was educated at Winchester and at New College, Oxford. Having been called to the bar at the Middle Temple in 1810 he went the western circuit, became counsel to the Bank of England, sat in parliament from 1837 to 1841 for the city of Oxford, and, although of opposite politics to Lord Lyndhurst, acted in 1845 as his junior partner, and was made by him a judge of the common pleas in 1845. He was transferred to the queen's bench in the following year, and in 1859 came back to the common pleas as chief justice upon the promotion of Sir Alexander Cockburn. He retired in 1866, receiving the highest eulogiums for the ability and impartiality with which he had discharged the judicial office. He died at his estate at Bramshott, Hampshire, on the 28th of January.
ERLIKÖNIG-ERMELAND

1880, and a monument without his name but in his memory (sometimes erroneously supposed to mark the place where an old gibbet was) stands on the top of Hindhead.

See E. Manson, Builders of our Law (1904).

ERLIKÖNIG, or ERL-KING, a mythical character in modern German literature, represented as a giantic bearded man with a gigantic crown and robe of garments, who carries children away to that undiscovered country where he himself abides. There is no such personage in ancient German mythology, and the name is linguistically nothing more than the perpetuation of a blunder. It first appeared in Herder's Stimmen der Völker (1778), where it is used in the translation of the Danish song of the Elf-King's Daughter as equivalent to the Danish eldefor, or ellefør, that is, etterkonge, the king of the elves; and the true German word would have been Elkenkönig or Elcbuchin, afterwards used under the modified form of Eifenkönig by Wieland in his Oberon (1780). Herder was probably misled by the fact that the Danish word elle signifies not only elf, but also elder tree (Ger. Eiche). His mistake at any rate has been perpetuated by both English and French translators, who speak of a "king of the alders," "un roi des aunes," and find an explanation of the myth in the tree-worship of early times, or in the vapoery emanations that hang like clouds round the tree at night. This legend was adopted by Goethe as the subject of one of his finest ballads, rendered familiar to English readers by the translations of Lewis and Sir Walter Scott; and since then it has been treated as a musical theme by Reichardt and Schubert.

ERMAN, PAUL (1764-1851), German physicist, was born in Berlin on the 29th of February 1764. He was the son of the historian Jean Pierre Erman (1735-1814), author of Histoire des royaumes. He became teacher of science successively at the French gymnasium in Berlin, and at the military academy, and on the foundation of the university of Berlin in 1810 he was chosen professor of physics. He died at Berlin on the 1st of October 1851. His work was mainly concerned with electricity and magnetism, though he also made some contributions to optics and physiology. His son, GEORG ADOLF ERMAN (1806-1877), was born in Berlin on the 12th May 1806, and after studying natural science at Berlin and Königsberg, spent from 1828 to 1830 in a journey round the world, an account of which he published in Reise um die Erde durch Nordasien und die beiden Ozeane (1833-1848). The magnetic observations he made during his travels were utilized by C. F. Gauss in his theory of terrestrial magnetism. He was appointed professor of physics at Berlin in 1839, and died there on the 12th of July 1877. From 1841 to 1865 he edited the Archiv für wissenschaftliche Kunde von Russland, and in 1874 he published, with H. J. R. Petersen, Die Grundlagen der Gauss'schen Theorie und die Erscheinungen des Erscheinens in der Zeit 1829. His son JOHANN PETER ADOLF ERMAN (1854- ), a famous Egyptologist, was born in Berlin on the 31st of October 1854. Educated at Leipzig and Berlin, he became extraordinary professor in 1883 and ordinary professor in 1892 of Egyptology in the university of Berlin, and in 1898 he was appointed director of the Egyptian department of the royal museum. For an account of the Egyptian work of Erman and his school, see Egypt: Language.

ERMENEMRIC (fl. 359-376), king of the East Goths, belonged to the Amali family, and was the son of Achulf. His name occurs as Ermanarinus (Jordanes), Afrmanari (Gothic), Eroomenric (A. Sax.), Jormunrek (Norse), Ermenrich (M.H. German). Ermanaric built up for himself a vast kingdom, which eventually extended from the Danube to the Baltic and from the Don to the Theiss. He drove the Vandals out of Dacia, corning crown and race of the neighbour tribes of West Goths, procured the submission of the Herules, of many Slav and Finnish tribes, and even of the Esthonians on the shores of the Gulf of Bothnia. In his later days he went to the Bosphorus off his yoke, and, on the invasion of the Huns, rather than witness the downfall of his kingdom he is said by Ammianus Marcellinus to have committed suicide. His fate early became the centre of popular tradition, which found its way into the narrative of Jordanes or Jornandes (De rebus geticis, chap. 24), who compared him to Alexander the Great and certainly exaggerated the extent of his kingdom. He is there said to have caused a certain Sinulida or Sanielit to be torn asunder by wild horses on account of his husband's traitorous conduct. Her brothers Sarus and Ammius sought to avenge him. They succeeded in wounding him with a blow in the Goths, and his death supervened in his one hundred and tenth year from the joint effects of his wound and fear of the Hunnish invasion. This is evidently a paraphrase of popular story which sought to supply plausible reasons for Ermanaric's end. In German legend Ermanaric became the typical cruel tyrant, and references to his crimes abound in German epic and in Anglo-Saxon poetry. He is made to replace Olodmar as the enemy of Dietrich of Bern, his nephew, and his history is related in the Norse Víkinga or Thúrjóskaga, which chiefly embodies German tradition. His evil genius, Sifka, Sibicho or Bici, brings about the death of his three sons. The Harlingus, Imbrecke and Fritile, are his nephews, whom he has strangled for the sake of their treasure, the Brisingmen. Sonhild or Svanhild becomes the wife of Ermanaric, and the motive for her murder is replaced by an accusation of adultery between Svanhild and her stepson. The story was connected with the Niblung saga, and goes to the Scandinavian north by way of Germany. In the Völsunga Saga Svanhild is the daughter of Sigurd and Gudrun. She is given in marriage to the Gothic king Jörmunrekk (Ermanaric), who sends his son Randver as proxy wooer in company of Bici, the evil counsellor. Randver is persuaded by Bici to take his father's bride for himself. Randver is hanged and Svanhild trampled to death by horses in the gate of the castle. Gudrun eggs on Óðri and Hámðir or Þamþow, her two sons by her third husband, Jónakr the Hun, to avenge their sister. On the way they slay their half-brother Erp, whom they suspect of lukewarmness in the cause; arrived in the hall of Ermanaric they make a great slaughter of the Goths, and hew off the hands and feet of Ermanaric, but they themselves are slain with stones. The tale is told with variations by Saxo Grammaticus (Historia Danica, ed. Müller, p. 408, &c.), and in the Icelandic poems, the Lay of Hávamðar, Gudrun's Chain of We, and in the prose Edda.

ERMELO. a district and town of the Transvaal. The district lies in the south-east of the province and is traversed by the Drakensberg. In it are Lake Chrisis, the only true lake in the country, and the sources of the Vaal, Olifants, Komati, and Usuto rivers, which rise within 30 m. of one another. The region has a general elevation of about 5500 ft. and is fine agricultural and pastoral country, besides containing valuable minerals, including coal and gold. Ermeio town, pop. (1904) 1,457, is by rail 175 m. S.E. of Johannesburg, and on the S.S.W. of Machado-dorp on the Pretoria-Delagros Bay railway. A government experimental farm, with some 1000 acres of plantations, is maintained here.

ERMINE, an alternative name for the stoat (Felis erminea), apparently applicable in its proper sense only when the animal is in its white winter coat. This animal measures rofin. in length exclusive of the tail, which is about 4 in. long, and becomes bushy towards the point. The fur in summer is reddish brown above and white beneath, changing in the winter of northern latitudes to snowy whiteness, except at the tip of the tail, which at all seasons is black. In Scottish specimens this change in winter is complete, but in those found in the southern districts of England it is usually only partial, the ermine presenting during winter a piebald appearance. The white colour is evidently protective, enabling the animals to elude the observations of their enemies, and to steal unobserved on their prey.

It also retains heat better than a dark covering, and may thus serve to maintain an equable temperature at all seasons within the body. The colour change seems to be due to phagocytes devouring the pigment-bodies of the hair, and not to a moult. The species is a native of the temperate and subarctic zones of the Old World, and is represented in America by a form which can scarcely be regarded as specifically distinct. It inhabits thickets and stony places, and frequently makes use of the deserted burrows of moles and other underground mammals. Exceedingly sanguinary in disposition, and agile in its movements, it feeds principally on rats, water-rats and rabbits, which it pursues with pertinacity and boldness, hence the name stoat, signifying bold, by which it is commonly known. It takes readily to water, and will even climb trees in pursuit of prey. It is particularly destructive to poultry and game, and has often been known to attack hares, fixing itself to the throat of its victim, and defying all the efforts of the latter to disengage it. The female bears forth five young ones about the beginning of summer. The winter coat of the ermine forms one of the most valuable of commercial furs, and is imported in enormous quantities from Norway, Sweden, Russia and Siberia. It is largely used for muffls and tippets, and as a trimming for state robes, the jet black points of the tails being inserted at regular intervals as an ornament. In the reign of Edward III. the wearing of ermine was restricted to members of the royal family; but the female is not into almost all state robes, the rank and position of the wearer being in many cases indicated by the presence or absence, and the disposition, of the black spots. (See also FUR.)

ERMINE STREET. Documents and writers of the 11th and succeeding centuries occasionally mention four "royal roads" in Britain—Icknield Street, Ermine or Ermine Street, Watling Street and Foss Way—as standing apart from all other existing roads and enjoying the special protection of the king. Unfortunately these authorities are not at all agreed as to their precise course; the roads themselves do not occur as specially privileged in actual legal or other practice, and it is likely that the category of Four Roads is the invention of a lawyer or an antiquary. The names are, however, attested to some extent by early charters which name them among other roads, as boundaries. From these charters we know that Icknield Street ran along the Berkshire downs and the Chilterns, that Ermine Street ran more or less due north through Huntingdonshire, that Watling Street ran north-west across the midlands from London to Shrewsbury, and Foss diagonally to it from Lincoln or Leicester to Bath and mid-Somerset. This evidence only proves the existence of these roads in Saxon and Norman days. But they all seem to be much older. Icknield Street is probably a prehistoric ridgeway along the downs, utilized perhaps by the Romans near its eastern end; but in general not Roman. Ermine Street coincides with part of a line of Roman roads leading north from London through Huntingdon to Lincoln. This line is followed by the Old North Road through Cheshunt, Buntingford, Royston, and Huntingdon to Castor near Peterborough; and thence it can be traced through lanes and byways past Ancaster to Lincoln. Watling Street is the Roman highway from London by St. Alban's (Verulamium) to Wroxeter near Shrewsbury (Viroconium). Foss is the Roman highway from Lincoln to Bath and Exeter. Hence it has been supposed, and is still frequently alleged, that the Four Roads were the principal highways of Roman Britain. This, however, is not the case. Icknield Street is not Roman and the three roads which follow Roman lines, Ermine Street, Watling Street, and Foss, held no particular position in the Romano-British road system (see BRITAIN: Roman). In later times, the names Ermine Street, Icknield Street and Watling Street have been applied to other roads of Roman or supposed Roman origin. This, however, is wholly the work of Elizabethan or subsequent antiquaries and deserves no credence.

The derivations of the four names are unknown. Icknield, Ermine and Watling may be from English personal names; Foss, originally Fos, seems to be the Latin fossa in its occasional medieval sense of a bank of upcast earth or stones, such as the agger of a road. (F. J. H.)

ERMOLDUS NIGELLIUS, or ERMOLD THE BLACK, was a monk of Aquitaine, who accompanied King Pippin, son of the emperor Louis I., on a campaign into Britanny in 824. Subsequently he was banished from Pippin's court on a charge of inciting the king against his father, and retired to Strassburg, where he sought to regain the emperor's favour by writing a poem on his life and deeds. About 850 he obtained his recall, and has been identified with Hermoldus, who appears as Pippin's chancellor in 838. Ermondus was a cultured man with a knowledge of the Latin poets, and his poem, In honorem Hludovici imperatoris, has some historical value. It consists of four books and deals with the life and exploits of Louis from 781 to 826. He also wrote two poems in imitation of Ovid, which were addressed to Pippin.

ERNE, the name of a river and two lakes in the north-west of Ireland. The river rises in Lough Gowna, county Longford, 154 ft. above sea-level, flows north through Lough Oughter with a serpentine course and a direction generally northward, and then broadens into the Upper Lough Erne, a shallow irregular sheet of water 13 m. long, so beset with islands as to present the appearance of a number of water-channels ramifying through the land. The river then winds past the town of Enniskillen on its island, and enters Lough Erne, a beautiful lake nearly 18 m. long and 5 m. in extreme width, containing numerous islands, but less clayey than the upper lake, and regularly shaped. One of them, Devenish, is celebrated for its antiquarian remains (see ENNISKILLEN). The river then runs westward to Donegal Bay, forming a fine fall at Ballyshannon (q.v.). Lough Erne contains trout and pike. These waters admit of navigation by small steamers, but little trade is carried on. The area of
the Erne basin, which includes a vast number of small loughs, is about 1600 sq. m., and it covers part of the counties Cavan, Longford, Leitrim, Fermanagh and Donegal. The length of the Erne valley is about 70 m.

ERNEST I. [ERNEST ANTON KARL LUDWIG], duke of Saxe-Coburg-Gotha (1784-1844), was the son of Francis, duke of Saxe-Coburg-Saalfeld, and was born on the 2nd of January 1784. At the time of his father’s death (5th of December 1806) the duchy of Coburg was occupied by Napoleon as conquered territory, and Ernest did not come into his inheritance till after the peace of Tilsit (July 1807). Owing to the part he had played in assisting the Prussians at the battle of Auerstädt he continued out of favour with Napoleon, and he threw himself with vigour into the war of liberation against the French. After the battle of Leipzig he was given the command of the V. army corps and reduced Mainz by blockade; he also commanded the Saxon troops during the campaign of 1815. By the congress of Vienna he was rewarded with the principality of Lichtenberg on the left bank of the Rhine, which received a slight augmentation after the second peace of Paris. These territories he sold to Prussia in 1834. In 1826, in the division of the territories of the duchy of Saxe-Gotha which followed the death of its last duke (February 1825), he received the duchy of Gotha, ceding that of Saalfeld to the duke of Meiningen; and he now exchanged his style of Ernest III. of Saxe-Coburg-Saalfeld for that of Ernest I. of Saxe-Gotha. In 1831 he was the only German prince given a vision of the connection to Coburg, but he did not interfere with the traditional system of estates of Gotha. He died on the 29th of January 1844.

Duke Ernest, who was not only a good soldier and keen sportsman, but an enlightened patron of the arts and sciences, did much for the economic, educational and constitutional development of his territories; and his advice always carried great weight in the councils of the other German sovereigns. It was, however, for the splendid international position attained by the house of Coburg under him that his reign is chiefly distinguished. His younger brother Leopold (q.v.) became king of the Belgians; his brother Ferdinand (b. 1785) married the wealthy princess Antoinette von Kohary (1816) and was the father of the duchess of Nemours and of the future King Ferdinand of Portugal. Of his sisters, Antoinette (1779-1824) married Duke Alexander of Württemberg; Juliane [Alexandra Feodorovna] (1781-1860) married the Russian cæsarevitch Constantine; from whom she was, however, divorced in 1820; and Victoria (1785-1861), wife of Edward Augustus, duke of Kent, became the mother of Queen Victoria. Duke Ernest was twice married: (1) in 1817 to Louise, daughter of Duke Augustus of Saxe-Gotha, whom he finally divorced in 1826; (2) in 1831 to Maria, daughter of Duke Alexander of Württemberg. Of his sons, by his first wife, Ernest succeeded him in the duchy, and Albert married Queen Victoria.

ERNEST II., duke of Saxe-Coburg-Gotha (1818-1893), was born at Coburg on the 21st of June 1818, being the eldest son of Duke Ernest I. He enjoyed a varied education; he studied at the university of Bonn with his brother Albert; his military training he received in the Saxon army. The widespread connexions of his family opened to him many courts of Europe, and after he became of age he travelled much. The position of his uncle Leopold, who was king of the Belgians, and especially the marriage of his brother Albert to the queen of England, his cousin, gave him peculiar opportunities for becoming acquainted with the political problems of Europe. In 1840-1841 he undertook a journey to Spain and Portugal; in the latter country another cousin, Ferdinand, was king-consort. In 1844 he succeeded his father. His own character and the influence of the king of the Belgians made him one of the most liberal princes in Germany. He was able to bring to a satisfactory conclusion disputes with the Coburg estates. He passed through the ordeal of Saxe-Coburg-Gotha. In 1841 he had given the Coburgians a new constitution by which the administration of his two duchies was assimilated in many points. The government of his small dominions did not afford sufficient scope for his restless and versatile ambition; his desire to play a great part in German affairs was probably increased by the feeling that, though he was the head of his house, he was to some extent overshadowed by the younger branches of the family which ruled in Belgium, England and Portugal. He was one of the foremost supporters of every attempt made to reform the German constitution and bring about the unity of Germany. He took a warm interest in the proceedings of the Frankfort parliament, and it was often said, probably without justice, that he was the man in the cabinet who was most ardently hoping to be chosen emperor himself. However that may be, he strongly urged the king of Prussia to accept that position when it was offered him in 1849; he took a very prominent part in the complicated negotiations of the following year, and it was at his suggestion that a congress of princes met at Berlin in 1850. He highly valued the opportunities which this and similar meetings gave him for exercising political influence, and he would have felt most at home as a member of a permanent council of the German princes.

Ambitious also of military distinction, and sympathizing with the rising of the people of Schleswig-Holstein against the Danes in 1849, Ernest accepted a command in the federal army. In the engagement of Eckernförde in April 1849 the troops under his orders succeeded in capturing two Danish frigates, a remarkable feat of which he was justly proud. His greatest services to Germany were performed during the years of reaction which followed the failure of the Liberal movement in 1848. He gave a free hand to the Liberals and was almost alone in his fidelity to the Liberal and National ideals, and he allowed his dominions to be used as an asylum by the writers and politicians who had to leave Prussia and Saxony. The reactionary parties looked on him with great suspicion, and it was at this time that he formed a friendship with Gustav Freytag, the celebrated novelist, whom he protected when the Prussian government demanded his arrest. His connexion with the English court gave him a position of much influence, but none was more pure and genuine in his feelings and opinions. The marriage of his niece Victoria with Frederick, the heir to the Prussian throne, strengthened his connexion with Prussia, but caused the Conservative party to look with increased suspicion on the Coburg influence. He was the first German prince to visit Napoleon III., and was present when Orsini made his celebrated attempt on the emperor’s life. After 1860 he became the chief patron and protector of the National Verein; he encouraged the newly-formed rifle clubs, and not withstanding the strongest disapproval of his fellow-monarchs, allowed his court to become the centre of the rising national agitation. Still a warm adherent of Prussia, in 1862 he set an example to the other princes by voluntarily making an agreement by which his troops were placed in war under the command of the king of Prussia. Like all the other Nationalists, he was much embarrassed by the policy of Bismarck, and the democratic opinions of the Coburg court, which were shared by the crown prince Frederick, were a serious embarrassment to that minister. The opposition became more accentuated when the duke allowed his dominions to be used as the headquarters of the agitation in favour of Frederick, duke of Augustenburg, who claimed the duchies of Schleswig and Holstein, and it was at this time that Bismarck is reported to have said that if Frederick the Great had been alive the duke would have been in the fortress of Spandau. In 1865 he was present at the Fürstenstag in Frankfort, and from this time was in more frequent communication with the Austrian court, where his cousin Alexander, Count Mendoß, was minister. However, when war broke out in 1866, he at once placed his troops at the disposal of Prussia; Bismarck had in an important letter explained to him his policy and tactics. He was personally concerned in one of the most interesting events of the war; for the Hanoverian army, in its attempt to March south and join the Bavarians, had to pass through Thuringia, and the battle of Langensalza was fought in the immediate neighbourhood of Gotha. His troops took part in the battle, which ended in the rout of the Prussians, the duke, who was not present during the fight, in vain attempting to stop it. He bore an important share in the negotiations before and after the battle, and his action at this time has been
the subject of much controversy, for it was suggested that while he offered to mediate he really acted as a partisan of Prussia. For his services to Prussia he received as a present the forest of Schmalkalden. He was with the Prussian headquarters in Bohemia during the latter part of the war.

With the year 1866 the political rôle which Ernest had played ended. The result was perhaps not quite equal to his expectations, but it must be remembered how difficult was the position of the minor German princes; and he quoted with great satisfaction the words used in 1871 by the emperor William at Versailles, that "to him in no small degree was due the establishment of the empire." He was a man of varied tastes, a good musician—he composed several operas and songs—and a keen sportsman, a quality in which he differed from his brother. Notwithstanding his Liberalism, he had a great regard for the dignity of his rank and family, and in his support of constitutional government would never have sacrificed the essential prerogatives of sovereignty. He died at Reinhardsbrunn on the 22nd of August 1893. In 1842 the duke married Alexandra, daughter of the grand duke of Baden; there were no children by this marriage and the succession to Saxe-Coburg-Gotha passed therefore to the children of his younger brother Albert. By Albert's marriage contract the duchy could not be held together with the English crown; thus his eldest son, afterwards Edward VII., was passed over and it came to his second son, Alfred, duke of Edinburgh (1844-1900). When Alfred died without sons in July 1900 the succession to the duchy passed to a younger brother, Charles Edward, duke of Connaught; but the duke of Connaught, like his predecessor Arthur, passed on their claim to Charles Edward, duke of Albany (b. 1884), who became duke of Saxe-Coburg-Gotha in succession to his uncle Alfred. In 1905 Charles Edward married Victoria Adelaide (b. 1888), princess of Schleswig-Holstein, by whom he has a son, John Leopold (b. 1906).

Duke Ernest was something of a writer. He brought out an account of the travels in Egypt and Abyssinia which he undertook in 1847, Herzog Ernst von Sachsen-Coburg-Gotha nach Ägypten (Leipzig, 1864); and he published his memoirs, Aus meinem Leben und aus meiner Zeit (Berlin, 1887-1888). This work is in three volumes and contains much valuable information on a most critical period of German history; there is an English translation by P. Andrease (1888-1890).

See also Sir T. Martin, Life of H.R.H. the Prince Consort (1877-1880); Hon. C. Grey, Early Years of the Prince Consort (1895); A. Ohorn, Herzog Ernst II., ein Lebensbild (Leipzig, 1893); and E. Tempeltey, Herzog Ernst von Coburg and das Jahr 1866 (Berlin, 1897).

ERNEST AUGUSTUS (1771-1851), king of Hanover and duke of Cumberland, fifth son of the English king George III., was born at Kew on the 5th of June 1771. Having studied at the university of Göttingen, he entered the Hanoverian army, serving as a leader of cavalry when war broke out between Great Britain and France in 1793, and winning a reputation for bravery. He lost the sight of one eye at the battle of Tournai in May 1794, and when Hanover withdrew from the war in 1795 he returned to England, being made lieutenant-general in the British army in 1799. In the same year he was created duke of Cumberland and Teviotdale and granted an allowance of £13,000 a year, after which he held several lucrative military positions in England, and began to attend the sittings of the House of Lords and to take part in political life. A staunch Tory, the duke objected to all proposals of reform, especially to the granting of any relief to the Roman Catholics, and had great influence with his brother the king in his dislike towards King George IV., in addition to being often consulted by the Tory leaders. In 1810 he was severely injured by an assassin, probably his valet Sellis, who was found dead; and subsequently two men were imprisoned for asserting that the duke had murdered his valet. Recovering from his wounds, Cumberland again proceeded to the seat of war; and having been made a British field-marshal, was in command of the Hanoverian army during the campaigns of 1813 and 1814, being present, although not in action, at the battle of Leipzig. In May 1815 Ernest married his cousin, Frederica (1778-1841), daughter of Charles II. duke of Mecklenburg-Strelitz and widow of Frederick, prince of Solms-Braunfels, a union which was very repugnant to his mother Queen Charlotte, and was disliked in England, where the duke's strong Toryism had made him unpopular. Parliament refused to increase his allowance from £18,000, to which it had been raised in 1804, to £24,000 a year, and indignant at the treatment he received the duke spent some years in Berlin. Returning to England after the accession of George IV. in 1820, his political power was again considerable, while deaths in the royal family made it likely that he would succeed to the throne. Although his personal influence with the sovereign ceased upon the death of George IV. in 1830, he continued to oppose all measures for the extension of civil and religious liberty, including the Reform Bill of 1832; and his unpopularity was augmented by suspicions that he had favoured the formation of Orange lodges in the army. When William IV. died in June 1837, the crowns of Great Britain and Hanover were separated; and Ernest, as the nearest male heir of the late king, became king of Hanover. At once cancelling the constitution which William had given to his kingdom in 1826, he acted as an absolute monarch, and the constitution which he sanctioned in 1840 was permeated with his own illiberal ideas. In German politics he was vigilant and active, and mindful of the material interests of his country. His reign, however, was a stormy one, and serious trouble between king and people had arisen when he died at Herrenhausen on the 18th of November 1851 (see HANOVER: History). In spite of his arbitrary rule and his reactionary ideas the king was popular among his subjects, and as the statue in Hanover bears the words, "Dem Lebenden sein treues Volk." Ernest, who is generally regarded as the ablest of the sons of George III., left an only child, George, who succeeded him as king of Hanover.

See C. A. Wilkinson, Reminiscences of the Court and Times of King Ernest of Hanover (London, 1866); von Malortie, König Ernst August (Hanover, 1861); and the various histories of Great Britain and Hanover for the period.

ERNESTI, JOHANN AUGUST (1797-1878), German theologian and philologist, was born on the 4th of August 1797, at Tannenstadt in Thuringia, of which place his father was pastor, besides being superintendent of the electoral dioceses of Thuringia, Salz and Sangerhausen. At the age of sixteen he was sent to the celebrated Saxon cloister school of Pforta (Schulpforta). At twenty he entered the university of Wittenberg, and studied afterwards at the university of Leipzig. In 1830 he was made master in the faculty of philosophy. In the following year he accepted the office of connecter J. J. Thoma's school at Lichtenfels, and in 1835, when J. M. Gesner was then rector, an office to which Ernesti succeeded in 1834. He was, in 1832, named professor extraordinarius of ancient literature in the university of Leipzig, and in 1856 professor ordinarius of rhetoric. In the same year he received the degree of doctor of theology, and in 1799 was appointed professor ordinarius in the faculty of theology. Through his learning and his manner of discursing, he co-operated with S. J. Baumgarten of Halle (1707-1757) in dissegregating the current dogmatic theology from its many scholastic and mystical excrecences, and thus paved a way for a revolution in theology. He died, after a short illness, in his seventy-sixth year, on the 11th of September 1871.

It is perhaps as much from the impulse which Ernesti gave to sacred and profane criticism in Germany, as from the intrinsic excellence of his own works in either department, that he must derive his reputation as a philologist or theologian. With J. S. Semler he co-operated in the revolution of Lutheran theology, and in conjunction with Gesner he instituted a new school in ancient literature. He detected grammatical niceties in Latin, in regard to the consecution of tenses which had escaped preceding critics. His canons are, however, not without exceptions. As an editor of the Greek classics, Ernesti hardly deserves to be named beside his Dutch contemporaries, Tiberius Hemsterhaus (1685-1766), L. C. Valckenier (1715-1785), David Ruhnken (1723-1788), or his colleague J. J. Reiske (1726-1774). The higher criticism was not even attempted by Ernesti. But to him and to Gesner is due the credit of having formed, by discipline
and by example, philologists greater than themselves, and of having kindled the national enthusiasm for ancient learning. It is chiefly in hermeneutics that Ernesti has any claim to eminence as a theologian. But here his merits are distinguished, and the influence of his own writings was published (1761), almost peculiar to himself. In it we find the principles of a general interpretation, formed without the assistance of any particular philosophy, but consisting of observations and rules which, though already enunciated, and applied in the criticism of the profane writers, had never rigorously been employed in biblical exegesis. He was, in fact, the founder of the grammatico-historical school. He admits in the sacred writings as in the classics only one acceptable sense, and that the meaning is always to be found in the same with the logical and historical. Consequently he censures the opinion of those who in the illustration of the Scriptures refer everything to the illumination of the Holy Spirit, as well as that of others who, disregarding all knowledge of the languages, would explain words by things. The "analogy of faith," as a rule of interpretation, he greatly limits, and teaches that it can never afford of itself the explanation of words, but only determine the choice among their possible meanings. At the same time he avoids any inconsistency between the doctrine of the inspiration of the Bible as usually received and his principles of hermeneutics.

Among his works the more important are:—I. In classical literature: Initia doctrinae Sophocles (1756), many subsequent editions; Initia rhetorica, mostly antecedent to Xenophon’s Memorabilia (1737), Cicero (1737-1739). Suetonius (1748), Tacitus (1752), the Clouds of Aristophanes (1754), Homer (1759-1760), Caliméron (1761), Persuasion (1764), or the Quaesturae of Corinna, the Greek lexicon of Hedericus, and the Bibliotheca Latina of Fabricius (unfinished); Archæologia literaturae (1768), new and improved edition by Martini (1770); Horae Tursellini Horti Philologicī (1769). II. In sacred literature: A neutermatorius sive confusionis disputationis Monumentis de rebus ibigurgicis (1755-1758); Neue theologische Bibliothek, voi. i. to x. (1760-1769); Instauratio interpreti. Nova Text. (3rd ed., 1775); Neuere theologische Bibliothek, voi. i. to x. (1771-1775). Besides these, he published more than a hundred smaller works, many of which have been collected in the three following publications:—Opuscula oratoria (1759, 2nd ed., 1767); Opuscula philologica at critica (1764, 2nd ed., 1776); Opuscula theologica (1773). See Herzog-Hauck, Realencyclopaedie; J. E. Sandys, Hist. of Class. Schol. (1906).

ERNESTI, JOHANN CHRISTIAN GOTTLIEB (1756-1802), German classical scholar, was born at Arnsburg, Thuringia, and studied with his uncle, J. A. Ernesti, at the university of Leipzig. On the 5th of June, 1782, he was made supplementary professor of philosophy at his own university; and on the death of his cousin August Wilhelm in 1801 he was for five months professor of rhetoric. He died on the 5th of June of the same year.

His principal works are:—Editions of Aesop’s Fabulae (1781); of the Greek lyric poets (1779); De Suidis et Suidinis libris (1785); Athenaeus’ Deipnosophistae (1786); and of Silius Italicus Punica (1791-1792); Lexicon Technologicum Graecoroman Rhetoricae (1795); Lexicon technologicum Latinarum rhetoricae (1797), and Cicero’s (1799-1802).

ERNST, HEINRICH WILHELM (1814-1865), German violinist and composer, was born at Brünn, in Moravia, in 1814. He was educated at the Conservatorio of Vienna, studying the violin under Joseph Böhm and Joseph Mayseder, and composition under Ignaz von Seyfried. At the age of sixteen he made a concert tour in south Germany, which established his reputation as a violinist of the highest promise. In 1832 he went to Paris, where he lived for several years. During this period he formed an intimacy with Stephen Heller, which resulted in their charming joint compositions—the Pendé fugitiva for piano and violin. In 1843 he paid his first visit to London. The impression which he then made as a violinist was more than confirmed in the following year, when his rare powers were recognized by the musical public. Thenceforward he visited England nearly every year, until his health broke down owing to long-continued neuralgia of a most severe kind. The last seven years of his life were spent in retirement, chiefly at Nice, where he died on the 8th of October 1865. As a violinist Ernst was distinguished by his almost unlimited executive power, long-time conception, and his passionate expression. As a composer he wrote chiefly for his own instrument, and his Elegie and Oitello Fantasia rank among the most treasured works for the violin.

ERBOD, a town of British India, in the Coimbatore district of Mysore, situated on the right bank of the river Cauvery, which is here crossed by an iron railway girder bridge of 22 spans. Pop. (1901) 15,520. Here the South Indian railway joins the South-Western line of the Madras railway, 243 m. from Madras.

There are exports of cotton and saltpetre; and the town has a steam cotton press.

EROS, a minor planet discovered by Witt at Berlin on the 14th of August 1858, and, so far as yet known, unique in that its perihelion lies far within the orbit of Mars. In Greek mythology, the god of love. He is not mentioned in Homer; in Hesiod (Theog. 120) he is one of the oldest and the most beautiful of the gods, whose power neither gods nor men can resist. He also evokes order and harmony out of Chaos by uniting the separated elements. This cosmic Eros, who in Orphic cosmogony sprang from the world-egg which Chronos, or Time, laid in the bosom of Chaos, and which is the origin of all created beings, degenerated in later mythology into the capricious god of sexual passion, the son of Aphrodite and Zeus, Ares or Hermes. He is commonly represented as a mischievous boy, the tormentor of gods and men, even his own mother not being proof against his attacks. His brother is Anteros, the god of mutual love, who punishes those who do not return the love of others, without which Eros could not thrive; he is sometimes described as the opponent of Eros. The chief associates of Eros are Pothos and Himeros (Longing and Desire), Peitho (Persuasion), and the Muses and the Graces; he himself is in constant attendance on Aphrodite. Later writers (Euripides being the first) assumed the existence of a number of Erotes (like the Roman Amores and Cupidines) with similar attributes. According to the philosophers, Eros was not only the god of sexual love, but also of the "royal and devoted friendship of men; hence the Theban "Sacred Bard" was devoted to him, and the Cretans and Spartans offered sacrifice to him before going into battle (Herodotus iii. 59). In Alexandrian poetry Eros is at one time the powerful god who conquers all, at another the elish god of love. For the Roman adaptation of Eros see CUPID, and for the later legend of Cupid and Psyche see PSYCHE.

In art Eros is represented as a beautiful youth or a winged child. His attributes are the bow and arrows and a burning torch. The rose, the hone, the cock and the goat are frequently associated with him. The most celebrated statue of him was at Thebes, the work of Praxiteles. Other famous representations of the Christian torso and Eros trying his bow (in the Capitoline museum).

See J. E. Harrison, Prolegomena to the Study of Greek Religion (1903); G. P. Schilpman, De Cupidins Cosmographia (1852); E. de Boeck, Eros, in: Dictionnaire des antiquites, Darmereberg and Saglio’s Dictionnaire des antiquites, and Pauly-Wissowa’s Realencyclopädie.

ERPENUTUS (original name VAN ERP), THOMAS (1584-1624), Dutch Orientalist, was born at Gorcum, in Holland, on the 11th of September 1584. After completing his early education at Leiden, he entered the university of that city, and in 1608 took the degree of master of arts. By the advice of Scaliger he studied Oriental languages whilst taking his course of theology. He afterwards travelled in England, France, Italy and Germany, forming connexions with learned men, and availing himself of the information which they communicated. During his stay at Paris he contracted a friendship with Casaubon, which lasted during his life, and also took lessons in Arabic from an Egyptian named Joseph Barbatus, otherwise called Abu-dakin. At Venice he perfected himself in the Turkish, Persic and Ethiopic languages. After a long absence, Erpenus returned to his own country in 1612, and on the 10th of February 1613 he was appointed professor of Arabic and other Oriental languages, Hebrew excepted, in the university of Leiden. Soon after his settlement at Leiden, animated by the example of Savary de Brèves, who had established an Arabic press at Paris at his own charge, he caused new Arabic characters to be cut for a great expense, and to be printed in his own house.
instituted a second chair of Hebrew in his favour. In 1620 he was sent by the States of Holland to induce Pierre Dumoulin or André Rivet to settle in that country; and after a second journey he was successful in inducing Rivet to comply with their request. Some time after the return of Erpenius, the states appointed him their interpreter; and in this capacity he had the duty imposed upon him of translating and replying to the different letters of the Moslem princes of Asia and Africa. His reputation had now spread throughout all Europe, and several princes, the kings of England and Spain, and the archbishop of Seville made him the most flattering offers; but he constantly refused to leave his native country. He was preparing an edition of the Koran with a Latin translation and notes, and was projecting an Oriental library, when he died prematurely on the 13th of November 1624.

Among his works may be mentioned his Grammatica Arabica, published originally in 1613 and often reprinted; Rudimenta linguae Arabicae (1620); Grammatica Ebreos generalis (1621); Grammatica Chaldaica et Syria (1628); and an edition of Elmacin's History of the Saracens.

ERROLL (or Errol), FRANCIS HAY, 2ND EARL OF (d. 1631), Scottish nobleman, was the son of Andrew, 8th earl, and of Lady Jean Hay, daughter of William, 6th earl. The date of his birth is unrecorded, but he succeeded to the earldom (cr. 1453) in 1583, was early converted to Roman Catholicism, and as a result of this joined in 1585 with the Earl of Hunsley against the throne of Elizabeth. A letter written by him, declaring his allegiance to the king of Spain, having been intercepted and sent by Elizabeth to James in February 1589, he was declared a rebel by the council. He engaged with Hunsley and Crawford in a rebellion in the north of Scotland, but their forces surrendered at Aberdeen on the arrival of the king in April; and in July Erroll gave himself up to James, who leniently refrained from exacting any penalty. In September of the same year he entered into a personal bond with Hunsley to guard against the throne of Elizabeth. He was imprisoned on suspicion of complicity in the attempt made by Gray and Bothwell to surprise the king at Falkland in June 1592; and though he obtained his release, he was again proclaimed a rebel on account of the discovery of his signature to two of the "Spanish Blanks," unwritten sheets subscribed with the names of the chief conspirators in a plot for a Spanish invasion of Scotland, to be filled up later with the terms of the projected treaty. After a failure to apprehend him in March 1593, Erroll and his companions were sentenced to abjure Romanism or leave the kingdom; and on their non-compliance were in 1594 declared traitors. On the 3rd of October they defeated at Glenlivit a force sent against them under Argyll; though Erroll himself was severally wounded, and Slains Castle, on which he had great estate, razed to the ground. He left Scotland in 1595, and Erroll, on report of his further conspiracies abroad, was arrested by the states of Zealand, but was afterwards allowed to escape. He returned to Scotland secretly in 1596, and on the 20th of June 1597 abjured Romanism and made his peace with the Kirk. He enjoyed the favour of the king, and in 1602 was appointed a commissioner to negotiate the union with England. His relations with the Kirk, however, were not so amicable. The reality of his conversion was disputed, and in May 1608 he was confined to the city of Perth "for the better resolution of his doubts," being subsequently declared an obstinate "papist," excommunicated, deprived of his estate, and imprisoned at Dumbarton; and after some further vacillation was finally released in May 1611. Lord Erroll died on the 16th of July 1631, and was buried in the church of Slains. He married (1) Anne, daughter of John, 4th earl of Atholl; (2) Margaret, daughter of the regent Murray; and (3) Elizabeth, daughter of Willum, 6th earl of Morton. By his third wife he had several children, of whom his eldest son, William, succeeded him. The dispute which began in his lifetime concerning the hereditary office of lord high constable between the families of Erroll and of the Earl Marischal was settled finally in favour of the former; thus establishing the precedence enjoyed by the earls of Erroll next after the royal family over all other subjects in Scotland.

See The Erroll Papers (Spalding Club Miscellany, vol. ii. 211); Andrew Lang, Hist. of Scotland, vol. ii.; Hist. MSS. Comm. MSS. of Earl of Mar and Kellie; Cat. Topologia; Hist. upon his whole attention became engrossed by history, bibliography and geography. At Halle he made the acquaintance of J. E. Fabri, professor of geography; and when the latter was made professor of history and statistics at Jena, Ersch accompanied him thither, and aided him in the preparation of several works. In 1788 he published the Versuch einer allgemeinen Geschichte der Erde, a supplement to the 4th edition of Meuse's Weltalter Deutschland. The researches required for this work suggested to him the preparation of a Repertorium über die allgemeinen deutschen und andere periodische Sammlungen für Erdkunde, Geschichte, und die damit verwandten Wissenschaften (Leipzig, 1790-1792). The fame which this publication acquired him led to his being engaged by Schütz and Hufeland to prepare an Allgemeines Repertorium der Literatur, published in 8 vols. (Jena and Weimar, 1793-1809), which condensed the literary productions of 15 years (1785-1800), and included an account not merely of the books published during that period, but also of articles in periodicals and magazines, and even of the criticisms to which each book had been subjected. While engaged in this great work he also projected La France littéraire, which was published at Hamburg in 5 vols., from 1797 to 1806. In 1795 he went to Hamburg to edit the Neue Hamburger Zeitung, founded by Viktor Klopstock, brother of the poet, but returned to Berlin in the following year. In 1808 he issued Die Literaturzeitung. He also obtained in the same year the office of librarian in the university, and in 1802 was made professor of philosophy. In 1803 he accepted the chair of geography and statistics at Halle, and in 1808 was made principal librarian. He here projected a Handbuch der deutschen Literatur seit der Mitte des 18. Jahrh., bis auf die neueste Zeit (Leipzig, 1812-1814) and, along with Johann Gottfried Gruber (q.v.), the Allgemeine Encyclopädie der Wissenschaften und Künste (Leipzig, 1818 sq.), which he continued as far as the 21st volume. The accuracy and thoroughness of this monumental encyclopaedia make it still an indispensable book of reference. Ersch died at Halle on the 16th of January 1828.

ERSKINE, EBBENZER (1680-1754), Scottish divine, the chief founder of the Secession Church (formed of dissenters from the Church of Scotland), was born on the 22nd of June 1680, most probably at Dryburgh, Berwickshire. His father, Henry Erskine, who was at one time minister at Coldstream, was ejected in 1662 by the Act of Uniformity, and, after suffering some years' imprisonment, was after the Revolution appointed to the parish of Chirnside, Berwickshire. After studying at the university of Edinburgh, Ebbenzee became minister of Portmack, Kinross-shire. There he remained for twenty-eight
ERSKINE, Henry—ERSKINE, R.

years, after which, in the autumn of 1733, he was translated to the West Church, Stirling. Some time before this, he, along with some other ministers, was "rebuked and admonished," by the general assembly, for defending the doctrines contained in the *Marrow of Modern Divinity* (see BOSTON, THOMAS). A sermon which he preached on lay patronage before the synod of Perth in 1733 furnished new grounds of accusation, and he was compelled to shield himself from rebuke by appealing to the general assembly. Here, however, the sentence of the synod was confirmed, and after many fruitless attempts to obtain a hearing, he, along with William Wilson of Perth, Alexander Moncrieff of Abernethy and John Fisher of Kinclaven, was suspended from the ministry by the commission in November of that year. Against this sentence they protested, and constituted themselves into a separate church court, under the name of the associate presbytery. In 1739 they were again summoned before the assembly, and in their corporate capacity declined to acknowledge the authority of the church, and were deposed in the following year. They received numerous accessions to their communion, and remained in harmony with each other till 1747, when a division took place in regard to the nature of the oath administered to burgesses. Erskine joined with the "burgher" section, and became their professor of theology. He continued also to preach to a numerous congregation in Stirling till his death, which took place on the 2nd of June 1754. Erskine was a very popular preacher, and a man of considerable force of character; he acted throughout on principle with honor and integrity. The burgh and anti-burgh sections of the Secession Church were reunited in 1820, and in 1847 they united with the relief synod in forming the United Presbyterian Church.

Erskine's published works consist chiefly of sermons. His *Life and Diary*, edited by the Rev. Donald Fraser, was published in 1816, and reprinted in 1876. Erskine, Henry (1746–1817), lord advocate of Scotland; the second son of Henry David, 10th earl of Buchan and brother of the lord chancellor Erskine, was born in Edinburgh on the 1st of November 1746. He was educated at the universities of St Andrews, Glasgow and Edinburgh, and was admitted a member of the faculty of advocates in 1768. His reputation as a clever and fluent speaker was first made in the debates of the general assembly, of which he had been early elected an elder. In 1785 he was appointed to the office of lord advocate, which he held during the brief coalition ministry of Fox and North. In 1788 he was elected dean of the faculty of advocates, and was re-elected annually till 1796, when his conduct in moving a series of resolutions at a public meeting, condemning the government's sedition and treason bills, brought on him the opposition of the ministerial party, and he was deposed in favour of Robert Dundas. On the formation of the Grenville ministry in 1806 he again became lord advocate and was returned to parliament for the Haddington burghs, which he exchanged at the general election of the same year for the Dumfries burghs. His tenure of the lord advocateship ended in March 1807 on the downfall of the ministry. In 1811 he gave up his practice at the bar and retired to his country residence of Almondel, in Linlithgowshire, where he died on the 8th of October 1817.

His eldest son, Henry David (1783–1857), succeeded as 12th earl of Buchan on his uncle's death in 1820. Erskine's reputation will survive as the finest and most eloquent orator of his day at the Scottish bar; added to a commanding forensic style was a most captivating wit, which, as Lord Jeffrey said, was "all argument, and each of his delightful illustrations a material step in his reasoning." Erskine was also the author of some poems, of which the best known is "The Emigrant" (1783).

See Lieut.-Col. A. Ferguson's *Henry Erskine* (1882).

ERSKINE, John (1721–1803), Scottish divine, son of John Erskine of Carnock, was born on the 2nd of June 1721. He studied law at the university of Edinburgh, but was eventually licensed to preach in 1743; and was successively parish minister of Kirkintilloch, near Glasgow, Culross, in Fifeshire (1753), New Greyfriars church in Edinburgh (1758), and Old Greyfriars church in 1768, where he became the colleague of Principal Robertson, the historian. Here he remained until his death, which took place on the 19th of January 1803. Dr Erskine's writings consist chiefly of controversial pamphlets on theological subjects. His sermons are clear, vigorous expositions of a moderate Calvinism, in which metaphysical argument and practical morality are happily blended. In church politics he was the leader of the evangelical party; and was much beloved for his high character and amiability.

ERSKINE, John, of Carnock (1645–1768), Scottish jurist, son of Lieut.-Colonel John Erskine, was born in 1645. He was admitted a member of the faculty of advocates in 1750. Although he never enjoyed much practice at the bar, he acquired a high reputation as a smooth and learned lawyer, and in 1737 was appointed professor of Scots law in the university of Edinburgh. In 1741 he published his *Principles of the Law of Scotland*, which he retired from his chair in 1765; and during the remainder of his uneventful life he occupied himself with the preparation of his great work, the *Institutes of the Law of Scotland*, which he did not live to publish. He died at Cardross, Perthshire, on the 1st of March 1768.

Erskine's *Institutes*, although not exhibiting the grasp of principle which distinguished his great predecessor Lord Stair, is so concise, clear, accurate and sound good sense, that it has always been esteemed the highest authority on the law of Scotland. The first edition appeared in 1733 and it has been many times reprinted. The *Principles*, although published first, is substantially an abridgment of the larger work, and is in some respects superior to it, being more concise and direct. It retains its place as the text-book on Scots law, and is frequently being re-edited.

ERSKINE, John, of Dun (1500–1551), Scottish reformer, the son of Sir John Erskine, laird of Dun, was born in 1500, and was educated at King's College, Aberdeen. At the age of twenty-one Erskine was the cause—probably by accident—of a priest's death, and was forced to go abroad, where he came under the influence of the new learning. It was through his agency that Greek was first taught in Scotland by Petrus de Marsiliis at Montrose. This fact counted for much in the progress of the Reformation. Erskine was also drawn towards the new faith by his close friend of the early days, Thomas Erskine, whose fate he was saved by his wealth and influence, and of John Knox, whose advice openly to discountenance the mass was given in the lodgings of the laird of Dun. In the stormy controversies of the time of Mary Stuart and James VI. Erskine was a conspicuous figure and a moderating influence. He was able to soothe the queen when her feelings had been outraged by Knox's denunciations—being a man "most gentill of nature"—and frequently acted as mediator both between the catholic and reformation parties, and among the reformers themselves. In 1560 he was appointed—though a layman—superintendent of the reformed church of Scotland for Angus and Mearns, and in 1572 he gave his assent to the modified episcopacy proposed by Morton at the Leith convention. Though never himself ordained, he was held in such high esteem by the leaders of the church as to be more than once elected moderator of the general assembly (first in 1564), and he was amongst those who in 1558 drew up the *Second Book of Discipline*. From 1579 he was a member of the king's council. He died in 1591. Erskine owed his peculiar influence among the Scottish reformers to the union—rare in those days—of steadfast convictions with a conciliatory manner; Queen Mary described him as "a mild and sweet-natured man, with true honesty and uprightness."

See the "Dun Papers" in the *Spalding Club Miscellany*, vol. iv. (1840), and the article by T. F. Henderson in the *Dict. Nat. Scot.*

ERSKINE, Ralph (1685–1752), Scottish divine, brother of Ebenezer Erskine (q.v.), was born on the 18th of March 1685. After studying at the university of Edinburgh, he was in 1711
ordained assistant minister at Dunfermline. He homologated the protesters which his brother laid on the table of the assembly after being rebuked for his synod sermon, but he did not formally withdraw from the establishment till 1737. He was also present, though not as a member, at the first meeting of the associate presbytery. When the secession took place on account of the oath administered to burgesses, he adhered, along with his brother, to the burgher section. He died after a short illness on the 6th of November 1752.

His works consist of sermons, poetical paraphrases and gospel sonnets. The Gospel Sonnets have frequently appeared separately. His Life and Diary, edited by the Rev. D. Fraser, was published in 1842.

ERSKINE, THOMAS, of Linlathen (1788-1870), Scottish theologian, youngest son of David Erskine, writer to the signet in Edinburgh, and of Anne Graham, of the Grammars of Airth, was born on the 13th of October 1788. He was a descendant of John, 1st or 6th earl of Mar, regent of Scotland in the reign of James VI., a grandson of Colonel John Erskine of Carnock. After being educated at the high school of Edinburgh and at Durham, he attended the literary and law classes at the university of Edinburgh, and becoming in 1810 a member of the Edinburgh faculty of advocates, he for some time enjoyed the intimate acquaintance of Cockburn, Jeffrey, Scott and other distinguished men whose talent then lent lustre to the Scottish bar. In 1816 he succeeded to the family estate of Linlathen, near Dundee, and devoted himself to theology. The writings of Erskine, especially his published letters, are distinguished by a graceful style, and possess originality and interest. His theological views have a considerable similarity to those of Frederick Denison Maurice, who acknowledges having been indebted to him for his first true conception of the meaning of Christ's sacrifice. Erskine had little interest in the "historical criticism" of Christianity, and regarded as the only proper criterion of its truth its conformity or nonconformity with man's spiritual nature, and its adaptability or non-adaptability to man's spiritual needs. He considered the incarnation of Christ as the necessary manifestation to man of an eternal sonship in the divine nature, apart from which those filial qualities which God demands from man could have no sanction; by faith as used in Scripture he understood to be meant a certain moral or spiritual activity or energy which virtually implied salvation, because it implied the existence of a principle of spiritual life possessed of an immortal power. This faith, he believed, could be properly awakened only by the manifestation, through Christ, of love as the law of life, and as identical with an eternal righteousness which it was God's purpose to inculcate in every individual soul. As an interpreter of the mystical side of Calvinism and of the psychological conditions which correspond with the doctrines of grace Erskine is unrivalled. During the last thirty-three years of his life Erskine ceased from literary work. Among his friends were Madame Vernet, the duchess de Broglie, the younger Madme de Stael, M. Vinet of Lausanne, Edward Irving, Frederick D. Maurice, Dean Stanley, Bishop Ewing, Dr John Brown and Thomas Carlyle. His wide influence was due to his high character and unassuming earnestness. He died at Edinburgh on the 20th of March 1870.

His principal works are Remarks on the Internal Evidence for the Truth of Reformed Religion (1820), an Essay on Faith (1822), and the Unconditional Priesthood of the Gospel (1828). The latter passed through several editions, and have also been translated into French. He is also the author of the Brazen Serpent (1831), the Doctrine of Election (1839), several "Introductory Essays" to editions of Christian Authors, and a posthumous work entitled Spiritual Order and Other Papers (1871). Two vols. of his letters, edited by William Hanna, D.D., with reminiscences by Dean Stanley and others, appeared in 1844.

ERSKINE, THOMAS ERKINIE, 1ST BARON (1759-1833), lord chancellor of England, was the third and youngest son of Henry David, 10th earl of Buchan, and was born in Edingburgh on the 30th of January 1750. From an early age he showed a strong desire to enter one of the learned professions; but his father, owing to his straitened circumstances, was unable to do more than give him a good school education at the high school of Edinburgh and the grammar school of St Andrews. In 1764 he was sent as a midshipman on board the "Tartar," but on finding, when he returned to this country after four years' absence in North America and the West Indies, that there was little immediate chance of his rank of acting lieutenant being confirmed, he quitted the service and entered the army, purchasing a commission in the 1st Royals with the meagre patrimony which had been left to him. But promotion here was as slow as in the navy; while in 1770 he had added greatly to his difficulties by marrying the daughter of Daniel Moore, M.P. for Marlow, an excellent wife, but as poor as himself. However, an accidental visit to an assize court in the town in which he was quartered, and an interview with Lord Mansfield, the presiding judge, confirmed his resolve to quit the army for the law. Accordingly on the 26th of April 1775 he was admitted a student of Lincoln's Inn. He also on the 13th of January following entered himself as a gentleman commoner on the books of Trinity College, Cambridge, but merely that by graduating he might be called two years earlier.

He read in the chambers of Francis Buller (afterwards Mr Justice Buller) and George (afterwards Baron) Wood, and was called to the bar on the 3rd of July 1778. His success was immediate and brilliant. An accident was the means of giving him his first case, Rea v. Baille, in which he appeared for Captain Thomas Baille, the lieutenant governor of Greenwich hospital, who had published a pamphlet animadverting in severe terms upon the abuses which Lord Sandwich, the first lord of the admiralty, had introduced into the management of the hospital, and against whom a rule had been obtained from the court of king's bench to show cause why a criminal information for libel should not be filed. Erskine was the junior of five counsel; and it was his good fortune that the proximity of his leaders consumed the whole of the first day, thereby giving the advantage of starting afresh next morning. He made use of this opportunity to deliver a speech of wonderful eloquence, skill and courage, which captivated both the audience and the court. The rule was discharged, and Erskine's fortune was made. He received, it is said, thirty retainers before he left the court. In 1781 he delivered another remarkable speech, in defence of Lord George Gordon—a speech which gave the death-blow to the doctrine of constructive treason. In 1783, when the Coalition ministry came into power, he was returned to parliament as member for Portsmouth. His first speech in the House of Commons was a failure; and he never in parliamentary debate possessed anything like the influence he had at the bar. He lost his seat at the dissolution in the following year, and remained out of parliament until 1790, when he was again returned for Portsmouth. But his success at the bar continued unimpaired. In 1783 he received a part of precedence. His first special retainer was in defence of Dr W. D. Shipshew, dentist, indicted at Shrewsbury for seditious libel—a defence to which was due the passing of the Libel Act 1792, laying down the principle that it is for the jury, and not for the judge to decide the question whether or no a publication is a libel. In 1789 he was counsel for John Stockdale, a bookseller, who was charged with seditious libel in publishing a pamphlet in favour of Warren Hastings, whose trial was then proceeding; and his speech on this occasion, making it his greatest effort, is considered one of the best expositions of the art of addressing a jury. Three years afterwards he brought down the opposition alike of friends and foes by defending Thomas Paine, author of The Rights of Man—holding that an advocate has no right, by refusing a brief, to convert himself into a judge. As a consequence he lost the office of attorney-general to the prince of Wales, to which he had been appointed in 1786; the prince, however, subsequently made amends by making him his chancellor of the exchequer. A number of instances of speeches may be mentioned those for Horne Tooke and the other advocates of parliamentary reform, and that for James Hadfield, who was accused of shooting at the king. On the accession of the Grenville ministry in 1806 he was made lord chancellor, an office for which his training had in no way prepared him, but which he fortunately held only during the short period his party was in power.
power. Of the remainder of his life it would be well if nothing could be said. Occasionally speaking in parliament, and hoping that he might return to office should the prince become regent, he gradually degenerated into a state of useless idleness. Never conspicuous for prudence, he aggravated his increasing poverty by an unfortunate second marriage.

His first wife had died in 1805, and he married at Gretna Green a Miss Mary Buck. The date of this marriage is not definitely known. Once only—in his conduct in the case of Queen Caroline—does he recall his former self. He died at Almondsley, Linkhightowshire, on the 17th of November 1823, of pneumonia, caught on the voyage to Scotland.

Erskine's great forensic reputation was, to a certain extent, a coconomitant of the numerous political trials of the day, but it was also due to his impassioned eloquence and undaunted courage, which so often carried audience and jury and even the court along with him. As a judge he did not succeed; and it has been questioned whether under any circumstances he could have succeeded. For the office of chancellor he was plainly unfit. As a lawyer he was well read, but by no means profound. His strength lay in the keenness of his reasoning faculty, in his dexterity and the ability with which he disentangled complicated masses of evidence, and above all in his unrivalled power of fixing and commanding the attention of juries. To no department of knowledge but law had he applied himself systematically, with the single exception of English literature, of which he acquired a notable mastery in early life, at intervals of leisure in college, on board ship, or in the field. Vanity is said to have been his ruling personal characteristic; but those who knew him, while they admit the fault, say that in him it never took an offensive form, even in old age, while the singular grace and attractiveness of his manner endeared him to all with whom he came in contact.

By his first wife he had four sons and four daughters. His eldest son, David Montagu (1737–1835), was a well-known divine; his second son, Henry Davie (1786–1850), was dean of Ripon; and his third son, Thomas (1788–1864), became a judge of the court of common pleas. By his second wife he had one son, born in 1821.

In 1772 Erskine published Observations on the Prevailing Abuses in the British Army, a pamphlet which had a large circulation, and in later life, Amlaw, an imitation of Gulliver's Travels. His most noted speeches have repeatedly appeared in a collected form. See Campbell's Lives of the Chancellors; Moore's Diaries; Ferguson's History of Disraeli's Henry Erskine, a Study (Paris, 1883); Lord Brougham's Memoirs, prefixed to Erskine's Speeches (1847); Romilly's Memoirs; the Croker Papers; Lord Holland's Memoirs.

ERUBESCITE, a native copper-iron sulphide, Cu₄Fe₃S₄, of importance as an ore of copper. It crystallizes in the cubic system, the usual form being that of interpenetrating cubes twinned on an octahedral plane. The faces are usually curved and rough, and the crystals confusedly aggregated together. Compact and granular masses are of more frequent occurrence. The colour on a freshly fractured surface is bronzy or coppery, but in moist air this rapidly tarnishes with iridescent blue and red colours; hence the names purple copper ore, variegated copper ore (Ger. Buntkupferspuren), horse-flesh ore, and erubescite (from the Lat. erubesere, "to grow red"). The lustre is metallic, and the streak greyish-black; hardness 3½; sp. gr. 5·0. Bornite (after Baron Ignaz von Born, b. 1745, d. 1791) is a name in common use for this mineral, and it predates erubescite, the name given by J. D. Dana in 1850, but afterwards rejected by him; French authors use the name philippite, after the English mineralogist, R. Phillips, who analysed the mineral; both these earlier names had, however, been previously used for other minerals.

Owing to the frequent presence of mechanically admixed chalcocite and chalcopyrite, the published analyses of erubescite show wide variations, the copper, for example, varying from 50 to 70%. Even the best Cornish crystals enclose a nucleus of chalcopyrite (CuFeS₂), and an analysis of these made in 1839 led to the long-accepted formula Cu₄Fe₃S₄. Recently, B. J.

Harrington has analysed carefully selected material and obtained the formula Cu₄Fe₃S₄.

Erubescite occurs in copper-bearing veins, and has been mined as an ore of copper at Redruth in Cornwall, Montecatini in the province of Pisa, Tuscany, Bristol in Connecticut, Acton in Canada, and other localities in North America. The best crystallized specimens are from the Carn Brea mine and other copper mines in the neighbourhood of Redruth, and from Bristol in Connecticut. Recently a few large isolated crystals with the form of isosceles triangles have been found with chlorite and albite in a gold-vein on Frosinone-Alpe in the Gross-Venediger, Tirol.

ERYSIPELAS (a Greek word, probably derived from ἐρυσίς, red, and ἄλη, skin)—synonyms, the Rose, St Anthony's Fire—an acute contagious disease, characterized by a special inflammation of the skin, caused by a streptococcus. Erysipelas is endemic in most countries, and epidemic at certain seasons, particularly the spring of the year. The poison is not very virulent, but it certainly can be conveyed by bedding and the clothes of a third person. Two varieties are occasionally described, a traumatic and an idiopathic, but the disease seems to depend in all cases upon the existence of a wound or abrasion. In the so-called idiopathic variety, of which facial erysipelas is the best known, the point of entry is probably an abrasion by the lachrymal duct.

When the erysipelas is of moderate character there is simply a redness of the integument, which feels somewhat hard and thickened, and upon which there often appear small vesicles. This redness, though at first circumscribed, tends to spread and affect the neighbouring sound skin, until an entire limb or a large area of the body may become involved in the inflammatory process. There is usually considerable pain, with heat and tingling in the affected part. As the disease advances the portions of skin first attacked become less inflamed, and exhibit a yellowish appearance, which is followed by slight desquamation of the cuticle. The inflammation in general gradually disappears. Sometimes, however, it breaks out again, and passes over the area originally affected the second time. But besides the skin, the subjacent tissues may become involved in the inflammation, and give rise to the formation of pus. This is termed phlegmonicous erysipelas, and is much more apt to occur in connexion with the traumatic variety of the disease. Occasionally the affected parts become gangrenous. Certain complications are peculiar to erysipelas, affecting the surface of the body, particularly inflammation of serous membranes, such as the pericardium or pleura.

Erysipelas of the face usually begins with symptoms of general ill health, the patient feeling languid, drowsy and sick, while frequently there is a distinct rigor followed with fever. Sore throat is sometimes felt, but in general the first indication of the local affection is a red and painful spot at the side of the nose or one of the cheeks or ears. Occasionally it would appear that the inflammation begins in the throat, and reaches the face through the nasal fossae. The redness gradually spreads over the whole surface of the face, and is accompanied with swelling, which in the lax tissues of the cheeks and eyelids is so great that the features soon become obliterated and the countenance wears a hideous expression. Advancing over the scalp, the disease may invade the neck and pass on to the trunk, but in general the inflammation remains confined to the face and head. While the disease progresses, besides the pain, tenderness and heat of the affected parts, the constitutional symptoms are very severe. The temperature rises often to 105° or higher, remains high for four or five days, and then falls by crisis. Delirium is a frequent accompaniment. The attack in general lasts for a week or ten days, during which the inflammation subsides in the parts of the skin first attacked, while it spreads onwards in other directions, and after it has passed away there is, as already observed, some slight desquamation of the cuticle.

Although in general the termination is favourable, serious and occasionally fatal results follow from inflammation of the membranes of the brain, and in some rare instances sudden death
has occurred from suffocation arising from oedema glotitidis, the inflammatory action having spread into and extensively involved the throat. One attack of this disease, so far from protecting from, appears rather to predispose to others. It is sometimes a complication in certain forms of exhausting disease, such as phthisis or typhoid fever, and is then to be regarded as of serious import. A very fatal form occasionally attacks new-born infants, particularly in the first four weeks of their lives. In epidemics of purperal fever this form of erysipelas has been specially found to prevail.

The treatment of erysipelas is best conducted on the expectant system. The disease in most instances tends to a favourable termination; and beyond attention to the condition of the stomach and bowels, which may require the use of some gentle laxative, little is necessary in the way of medicine. The employment of preparations of iron in large doses is strongly recommended by many physicians. But the chief point is the administration of abundant nourishment in a light and digestible form. Of the many local applications which may be employed, hot fomentations will be found among the most soothing. Dusting the affected part with powdered starch, and wrapping it in cotton wadding, is also of use.

In the case of phlegmonous erysipelas complicating wounds, free incisions into the part are necessary.

**ERYTHRAE** [mod. Liris], one of the Ionian cities of Asia Minor, situated on a small peninsula stretching into the Bay of Erythrae, at an equal distance from the mountains Mimas and Corycus, and directly opposite the island of Chios. In the peninsula excellent wine was produced. The town was said to have been founded by Ionians under Knophon, son of Codrus. Never a large city, it sent only eight ships to the battle of Lade. The Erythraeans owned for a considerable time the supremacy of Athens, but towards the close of the Peloponnesian wars they threw off their allegiance to that city. After the battle of Cnidus, however, they received Conon, and paid him homage in an inscription, still extant. Erythrae was the birthplace of two prophetesses—one of whom, Sibylla, is mentioned by Strabo as living in the early period of the city; the other, Athenais, lived in the time of Alexander the Great. The ruins include well-preserved Hellenistic walls with towers, of which five are still visible. The acropolis (280 ft.) has the theatre on its N. slope, and eastwards lie many remains of Byzantine buildings. Modern it is a considerable place and port, extending from the ancient harbour to the acropolis. The smaller coasting steamers call, and there is an active trade with Chios and Smyrna.

**ERYTHRINE**, the name given to (1) a mineral composed of a hydrated cobalt arsenate, and (2) in chemistry, a tetrahydric alcohol. (1) The mineral erythrine has the formula $\text{Co}_2(\text{AsO}_4)_2\cdot 2\text{H}_2\text{O}$ and crystallizes in the monoclinic system and is isomorphous with vivianite. It sometimes occurs as beautiful reddish-brown, or acicular-banded crystals with a bright crimson colour and brilliant lustre. On exposure to light the colour and lustre deteriorate. There is a perfect cleavage parallel to the plane of symmetry, on which the lustre is pearly. Cleavage flakes are soft ($H=2$), sectile and flexible; specific gravity 2.95. The mineral is, however, more often found as an earthy encrustation with a peach-blossom colour, and in this form was early (1727) known as cobalt-bloom (Ger. Koballblühe). The name erythrine, from 4200, "red," was given by F. S. Bendand in 1782. Erythrine occurs as a product of alteration of smaltite ($\text{CoAs}_2$) and other cobaltiferous arsenides. The finest crystallized specimens are from Schneeberg in Saxon. The earthy variety has been found in Thuriniga and Cornwall and some other places. (2) The alcohol erythrine has the constitutional formula $\text{HO}-\text{H}_2\text{C}-\text{CH}-(\text{OH})-\text{CH}_2\text{OH}$; it is also known as erythrol, erythrogluicin and phycite. It corresponds to tartaric acid, and, like this substance, it occurs in four stereoisomeric forms. The internally complexly modified modification, i-erythrine, corresponding to mesotartaric acid, occurs free in the algae *Protococcus vulgaris*, and as the oleisaline, erythrin, $\text{C}_4\text{H}_8\text{(OH)}_2\cdot (\text{C}_3\text{H}_4\text{O}_3)_n$, in many lichens and algae, especially *Roccella montagnae*. It has a sweet taste, melts at 126°, and boils at 330°. Careful oxidation with dilute nitric acid gives erythrose or tetrose, which is probably a mixture of a trioxaldehyde and trioxketone. Energetic oxidation gives erythritic acid and mesotartaric acid. i-Erythrine and the racemic mixture of the dextro and laevo varieties were synthesized by Griner in 1853 from divinyl.

**ERZERUM**, or Arzrum (Arm. Garin), the chief town of an important vilayet of the same name in Asiatic Turkey. It is a military station and a fortress of considerable strategical value, closing the roads from Kars, Olti and other parts of the frontier. Several important routes from Trebizond and various parts of Anatolia converge towards it from the west. It is situated at the eastern end of an open bare plain, 30 m. long and about 12 wide, bordered by steep, rounded mountains and traversed by the Kara Su, or western Euphrates, which has its source in the Dumlu Dagh a few miles north of that town, which lies at an elevation of 6250 ft. above sea-level, while the near hills rise to 10,000 ft. The scenery in the neighbourhood is striking, lofty bare mountains being varied by open plains and long valleys dotted with villages. Just east of the town is the broad ridge of the Deveboyun ("Camel's Neck"), across which the road passes to Kars. To the south is the Palanduken range, from which emerge numerous streams, supplying the town with excellent water. In the plain to the north the Kara Su traverses extensive marshes which afford good willow-shooting in the spring.

The town is surrounded by an earthen enceinte or rampart with some forts on the hills just above it, and others on the Deveboyun ridge facing east, the whole forming a position of considerable strength. The old walls and the citadel have disappeared. Inside the ramparts the town lies rather cramped, with narrow, crooked streets, badly drained and dirty; the houses are generally built of dark grey volcanic stone with flat roofs, the general aspect, owing to the absence of trees, being somewhat gloomy. The water-supply from Palanduken is distributed by wooden pipes to numerous public fountains. The town has a population of about 45,000, including about 10,000 Armenians, 2000 Persians and a few Jews. It has a garrison in peace of about 5000 men. It is the seat of the British consulate for Kurdistan, and there are other European consulates besides an American mission with schools. The great altitude accounts for very severe winter cold, occasionally 10° to 25° below zero F., accompanied by blizzards (tifi) sometimes fatal to travellers overtaken by them. The summer heat is moderate (59° to 77°) and

There are several well-built mosques (none older than the 16th century), public baths, and several good khans. There are Armenian and Catholic churches, but the most beautiful building is a *medresse* erected in the 17th century by the Seljucks, with ornamental doorway and two graceful minarets known as the *Chifte Minare*.

Situated on the main road from Trebizond into north-west Persia, the town has always a large caravan traffic, principally of camels, but since the improvement of communications in Russia this has declined. A good carriage-road leads to the coast at Trebizond, the journey being made in five or six days. There are also roads to Kars, Bayazid, Erzingham and Kharput. Blacksmiths' and coppersmiths' work is better here than in most Turkish towns; horse-shoes and brasswork are also famous. There are several tanneries, and Turkish boots and saddles are largely made. Jerked beef (pamirdak) is also prepared in large quantities for winter use. The plain produces wheat, barley, millet and vegetables. Wood fuel is scarce, the present supply being from the Tortum district, whence surface coal and lignite are also brought; but the usual fuel is *teak* or dripped cow-dung. The bazaars are of no great interest. Good Persian carpets and similar goods can be obtained.

Erzerum is a town of great antiquity, and has been identified with the Armenian Garin Kalakih, the Arabic Kalakale, and the Byzantine Theodoreopolis of the 5th century, when it was a frontier fortress of the empire—hence its name *Erzen-er-Rum*. It was captured by the Seljuks in 1201, when it was an important city, and it fell into Turkish possession in 1537. In July 1829 it was captured by the Russian general Paskevich, and the
occupation continued until the peace of Adrianople (September 1878). The town was unsuccessfully attacked by the Russians on the 9th of November 1877 after a victory gained by them a short time previously on the Deveboynu heights; it was occupied by them during the armistice (7th of February 1878) and restored to Turkey after the treaty of Berlin. In 1859 a severe earthquake destroyed much of the town, and another in November 1901 caused much damage.

The Erzerum vilayet extends from the Persian frontier at Baysazid, all along the Russian frontier and westward into Anatolia at Baburtu and Erzingan. It is divided into the three sanjaks of Baysazid, Erzerum, and Erzingan. It includes the highest portion of the Armenian plateau, and consists of bare undulating uplands varied by lofty ranges. The deep gorges of the Chorokh and Tortum streams north of the town alone have a different appearance, being well wooded in places. Both arms of the Euphrates have their rise in this country as well as the Aras (Araxes) and the Chorokh (Acampas). It is an agricultural country with few industries. Besides forests, iron, salt, sulphur and other mineral springs are found. Some of the coal and lignite mines in Tortum have been recently worked to supply fuel for Erzerum. The population is largely Armenian and Kurd with some Turks (Moslems 500,000, Christians 140,000). (C.W.W.; F.R.M.)

ERZEBIRGE, a mountain chain of Germany, extending in a W.S.W. direction from the Elbe to the Erzgebirge along Saxony. It stretches from E.N.E. to W.S.W. is about 80 m. and its average breadth about 25 m. The southern declivity is generally steep and rugged, forming in some places an almost perpendicular wall of the height of from 2000 to 2500 ft.; while the northern, divided at intervals into valleys, sometimes of great fertility and sometimes wildly romantic, slopes gradually towards the great plain of northern Germany. The central part of the chain forms a plateau of an average height of less than 3000 ft. At the extremities of this plateau are situated the highest summits of the range:—in the south-east the Keilberg (4080 ft.); in the north-east the Fichtelberg (3980 ft.); and in the south-west the Spitzberg (3650 ft.). Between the Keilberg and the Fichtelberg, at the height of about 3000 ft., is situated Gottesgab, the highest town in Bohemia. Geologically, the Erzgebirge range consists mainly of gneiss, mica and phyllite. As its name (Ore Mountains) indicates, it is famous for its mineral ores. The most important are silver and lead, the layers of both of which are very extensive, tin, nickel, copper and iron. Gold is found in several places, and some arsenic, antimony, bismuth, manganese, mercury and sulphur. The Erzgebirge is celebrated for its lace manufactures, introduced by Barbara Uttmann in 1547, embroideries, silk-weaving and toys. The climate is in winter inclement in the higher elevations, and, as the snow lies deep until the spring, the range is largely frequented by devotees of winter sport, ski, tobogganing, etc. In summer the air is bracing, and many climatic health resorts have sprung into existence, among which may be mentioned Kipsdorf, Bärenfeld and Oberwiesenthal. Communication with the Erzgebirge is provided by numerous lines of railway, some, such as that from Freiberg to Brüx, that from Chemitz to Komotau, and that from Zwickau to Carlsbad, crossing the range, while various local lines serve the higher valleys.

The Elstergebirge, a range some 16 m. in length, in which the Weisse Elster has its source, runs S.W. from the Erzgebirge to the Fichtelgebirge and attains a height of 2650 ft.

See Grohmann, Das Oberschlesische und seine Städte (1905), and Schurtz, Die Pässe des Erzgebirges (1801); also Daniel, Deutsch- land, vol. ii., and Gebauer, Länder und Völkerkunde, vol. i.

ERZINGAN, or ERZINJAN (Arrinj of the middle ages), the chief town of the sanjak in the Erzerum vilayet of Asiatic Turkey. It is the headquarters of the IV. army corps, being a place of some military importance, with large barracks and military factories. It is situated at an altitude of 3900 ft., near the western end of a rich well-watered plain through which runs the Kara Su or western Euphrates. It is surrounded by orchards and gardens, and is about a mile from the right bank of the river, which here runs in two wide channels crossed by bridges. The wide street traverses the town from east to west, but the others are narrow, unpaved and dirty, except near the new government buildings and the large modern mosque of Hajji Izzet Pasha to the north, which are the only buildings of note. The principal barracks, military hospital and clothing factory are at Karatekul on the plain and along the foot-hills to the north 3 m. off, one recent addition to the business buildings having electric power and modern British machinery; some older barracks and a military tannery and boot factory being in the town. The population numbers about 15,000, of whom about half are Armenians living in a separate quarter. The principal industries are the manufacture of silk and cotton and of copper dishes and utensils. The climate is hot in summer but moderate in winter. A carriage-road leads to Trebizond, and other roads to Sivas, Karakissar, Erzerum and Kharput. The plain, almost surrounded by lofty mountains, is highly productive with many villages on it and the border hills. Wheat, fruit, vines and cotton are largely grown, and cattle and sheep are bred. Water is everywhere abundant, and there are iron and hot sulphur springs. The battle in which the sultan of Rum (1243) was defeated by the Mongols took place on the plain, and the celebrated Armenian monastery of St Gregory, the Illuminator, lies on the hills 11 m. S.W. of the town.

Erzinjan occupies the site of an early town in which was a temple of Marduk, over which Bohemia was said to be important in the 4th century when St Gregory lived in it. The district passed from the Byzantines to the Seljuks after the defeat of Romanus, 1071, and from the latter to the Mongols in 1243. After having been held by Mongols, Tatars and Turcomans, it was added to the Osmanli empire by Mahomed II. in 1473. In 1784 the town was almost destroyed by an earthquake. (C.W.W.; F.R.M.)

ESAR-HADDON [Assur-akhi-iddina, "Assur has given a brother"]; Assur, son of Sennacherib; before his accession to the throne he had also borne another name, Assur-essilili-yanik-abla. At the time of his father's murder (the 20th of Tebet, 681 B.C.) he was commanding the Assyrian army in a war against Ararat. The conspirators, after holding Nineveh for 42 days, had been compelled to fly northward and invoke the aid of the king of Ararat. On the 11th of Lyyar (680 B.C.) a decisive battle was fought near Malatia, in which the veterans of Assyria won the day, and at the close of it saluted Esar-haddon as king. He returned to Nineveh, and his palace, which was the largest ever seen, was crowned king. A good general, Esar-haddon was also an able and conciliatory administrator. His first act was to crush a rebellion among the Chaldaean in the south of Babylonia and then to restore Babylon, the sacred city of the West, which had been destroyed by his father. The walls and temple of Bel were rebuilt, its gods brought back, and after his right to rule had been solemnly acknowledged by the Babylonian priesthood Esar-haddon made Babylon his second capital. A year or two later, Media was invaded and Median chiefs came to Nineveh to offer homage to their conqueror. He now turned to Palestine, where the rebellion of Abdi-milkutti of Zidon was suppressed, its leader beheaded, and a new Zidon built out of the ruins of the older city (676-675 B.C.). All Palestine now submitted to Assyria, and 12 Syrian and 10 Cyprian princes (including Manasseh of Judah) came to pay him homage and supply him with materials for his palace at Nineveh. But the formidable enemy had appeared on the Assyrian frontier (676 B.C.). The Cimmeri (see SCYTHIA) under Teuspa poured into Asia Minor; they were, however, overthrown in Cilicia, and the Cilician mountaineers who had joined them were severely punished. It was next necessary to secure the southern frontier of the empire. Esar-haddon accordingly marched into the heart of Arabia, to a distance of about 900 m., across a burning and waterless desert, and struck terror into the Arabian tribes. At last he was free to complete the policy of his predecessors by conquering Egypt, which alone remained to threaten Assyrian dominion in the West. Baal of Tyre had transferred his allegiance from Esar-haddon to the Egyptian king Tirhaka and opened to the latter the coast
road of Palestine; leaving a force, therefore, to invest Tyre. Esar-haddon led the main body of the Assyrian troops into Egypt on the 5th of Adar, 673 B.C. The desert was crossed with the help of the Arabian sheik. Egypt seems to have submitted to the invader and was divided into twenty satrapies. Another campaign, however, was needed before it could be finally subdued. In 670 B.C. Esar-haddon drove the Egyptian forces before him in 15 days (from the 3rd to the 18th of Tammuz) all the way from the frontier to Memphis, thrice defeating them with heavy loss and wounding Tiribasha himself. Three days after Tiribasha fell, and this was soon afterwards followed by the surrender of Tyre and its king. In 668 B.C. Egypt again revolted, and while on the march to reduce it Esar-haddon fell ill and died on the 10th of Marchesvan. His empire was divided between his two sons Assur-bani-pal and Samas-sum-ukin, Assur-bani-pal receiving Assyria and his brother Balibanlon, an arrangement, however, which did not prove to be a success. Esar-haddon was the builder of a palace at Nineveh as well as of one which he erected at Calah for Assur-bani-pal.

EsaU, the son of Isaac and Rebecca, in the Bible, and the elder twin brother of Jacob. He was so called because he was red (when he was born) and the same Edom (red) was given to him when he sold his birthright to Jacob for a red lentil pottage (Gen. xxv. 21-34). Another story of the manner in which Jacob obtained the superiority is related in Gen. xxviii. Here the younger brother impersonated the elder, and succeeded in deceiving his blind father by imitating the hairiness of his brother. He thus gained the blessing intended for the first-born, and Esau, on hearing how he had been forestalled, vowed to kill him. Jacob accordingly fled to his mother's relatives, and on his return, many years later, peace was restored between them (xxxii sq.). These primitive stories of the relations between the eponymous heads of the Edomites and Israelites are due to the older (Judaean) sources; the late notices of the Priestly school (see Genesis) preserve a different account of the parting of the two (Gen. xxxvi. 6-8), and lay great stress upon Esau's marriages with the Canaanites of the land, unions which were viewed (from the writer's standpoint) with great aversion (Gen. xxxv. 34 sq., xxvii. 40). For "Esau" as a designation of the Edomites, cf. Jer. xlix. 8. Obad. iv. 6, 8, and on their history, see Edom.

Esau's characteristic hairiness (Gen. xxv. 25, xxvii. 11) has given rise to the suggestion that his name is properly 'Eshon, from a root corresponding to the Arab. 'ishya, to have thick or matted hair; both words are related, etymologically suggests a "shaggy" mountain-land. According to Hommel (Sud-arab. Chrestom., p. 39 sq.) the name Esau has S. Arabian analogies. On the possible identity of the name with Usos, the Phoenician demi-god (Philo of Byblus, ap. Eusebius, Praep. Evang. i. 10), see Cheyne, Encyc. Bib. col. 1333; Lagrange, Etudes sur les religions sémittiques, p. 416 (Paris, 1893); Ed. Meyer, Israeliten, 278 sq. (and, on general questions, tb. 128 sq., 349 sq.).

Esbjerg, a seaport of Denmark in the amt (county) of Ribe, 18 m. from the German frontier on the west coast of Jutland. It has railroad communication with the east and north of Jutland, and with Germany. It was granted municipal rights in 1900, having grown with astonishing rapidity from 13 inhabitants in 1868 to 13,355 in 1901. This growth it owes to the construction of a large harbour in 1868-1888. It is the principal outlet westward for S. Jutland; exports pork and meat, butter, eggs, fish, cattle and sheep, skins, lard and agricultural seeds, and has regular communication with Harwich and Grimsby in England. Three miles S.E. is Nordby on the island of Fanø, the northernmost of the North Frisian chain. It is an arid bank of heathland and dunes, but both Nordby and Sønderho in the south are frequented as seaside resorts. The former has a school of navigation. The fisheries are valuable.

Estacada, a city and the county-seat of Delma county, Michigan, U.S.A., on Little Bay de Noquette, an inlet of Green Bay, about 60 m. S. of Marquette. Pop. (1890) 6868; (1900) 9249, of whom 5214 were foreign-born; (1910 census) 13,194.

It is served by the Chicago & North-Western and the Escanaba & Lake Superior railways. It is built on a picturesque promontory which separates the waters of Green Bay from Little Bay de Noquette, and its delightful summer climate, wild landscape scenery and facilities for boating and trout fishing make it a popular summer resort. Escanaba has a water front of 8 m., and is an important centre for the shipment of iron-ore, for which eight large and well-equipped docks are provided—there is an ore-crushing plant here; considerable quantities of lumber and fish are also shipped, and furniture, woolen goods (especially of maple) and wooden ware (butter-dishes and cloth jars) are manufactured. There is a large tie-preserving plant here. Good water power is supplied by the Escanaba river. Escanaba was settled in 1863, was incorporated as a village in 1893, and was first chartered as a city in the same year.

ESCAPE (in mid. Eng. escape or escape, from the O. Fr. eschappier, modern schapper, and escaper, low Lat. escapiam, from es, out of, and coppa, cape, cloak; cf. for the sense development the Gr. ἐξέφυγεν, literally to put off one's clothes, hence to slip out of, get away), a verb meaning to get away from, especially from impending danger or harm, to avoid capture, to regain one's liberty after capture. As a substantive, "escape," in law, is the regaining of liberty by one in custody contrary to due process of law. Such escape may be by force, if out of prison it is generally known as "prison-breach" or "prison-breaking," or by the voluntary or negligent act of the custodian. When an escape is caused by any act, it is termed "escape" (q.v.). "Escape" is used in botany of a cultivated plant found growing wild. The word is also used of a means of escape, e.g. "fire-escape," and of a loss or leakage of gas, current of electricity or water.

ESCHATOLOGY (Gr. ἔσχατος, last, and λόγος, science; the "doctrine of last things"); a theological term derived from the New Testament phrases "the last day" (ἐσχάτου καίρου, world), "the last times" (ἐσχάτας ἐποχας). A conception taken over from ancient prophecy (Is. ii. 2; Mal. iv. 1). It was the common belief in the apostolic age that the second advent of Christ was near, and would give the divine completion to the world's history. The use of the term, however, has been extended so as to include all that is taught in the Scriptures about the future life of the individual as well as the final destiny of the world. The reasons for the belief in a life after death are discussed in the article IMMORTALITY in the THEOLOGY, and it may be mentioned here that the earliest evidence of the concepts of the future of the individual or the world found in other religions, will deal with the teaching of the Old and New Testaments, the Jewish and the Christian Church regarding the hereafter.

There is a bewildering variety in the views of the future life and world held by different peoples. The future life may be conceived as simply a continuation of the present life in its essential features, although under conditions more or less favourable. It may also be thought of as retributive, as a reversal of present conditions so that the miserable are comforted, and the prosperous laid low, or as a reward or punishment for good or evil desert here. Personal identity may be absorbed, as in the transmigration of souls, or it may even be denied, while the good or bad result of one life is held to determine the weal or woe of another. The scene of the future life may be thought of on earth, in some distant part of it, or above the earth, in the sky, in heaven or stars, or beneath the earth. The abodes of bliss and the places of torment may be distinguished, or one last dwelling-place may be affirmed for all the dead. Sometimes the good find their abiding home with the gods; sometimes a number of heavens of varying degrees of blessedness is recognized (see F. B. Jevons, An Introduction to the History of Religion, chs. xxi. and xxii., 1902; and J. A. MacCulloch's Comparative Theology, xiv., 1902).

(1) Confucius, though unwilling to discuss any questions concerning the dead, by approving ancestor-worship recognized a future life. (2) Taoism promises immortality as the reward of
ESchatology

merit. (2) The Book of the Dead—a guide-book for the departed on his long journey in the unseen world to the abode of the blessed—shows the attention the Egyptian religion gave to the state of the dead. (4) Although the Babylonian religion presents a very gloomy view of the world of the dead, it is not without a few faint glimpses of a hope that a few mortals at least may gain deliverance from the dread doom.

(5) A characteristic feature of Indian thought is the transmigration of the soul from one mode of life to another, the physical condition being determined by the moral character of the preceding. But deliverance from this cycle of existences, which is conceived as misery, is promised by means of speculation and asceticism. Denying the continuance of the soul, Buddhism affirmed a continuity of moral consequences (Karma), each successive life being determined by the total moral result of the preceding life. Its doctrine of salvation was a guide to, if not absolute non-existence, yet cessation of all consciousness of existence (Nirvana). Later Buddhism has, however, a doctrine of many heavens and hells. (6) In Zoroastrism not only was continuance of life recognized, but a strict retribution was taught. Heaven and hell were very clearly distinguished, and each soul according to its works passed to the one or to the other. But this faith did not concern itself only with the future lot of the individual soul. It was also interested in the close of the world's history, and taught a decisive, final victory of Ormuzd over Ahriman, of the forces of good over the forces of evil, a doctrine at all important in the religious thought that Jewish eschatology in its later developments was powerfully influenced by the Persian faith. (7) Mahomedanism reproduces and exaggerates the lower features of popular Jewish and Christian eschatology (see the separate articles on these religions).

In the Old Testament we can trace the gradual development of an ever more definite doctrine of "the final condition of man and the world." This is regarded as the last stage in a moral process, a redemptive purpose of God. Jewish eschatology of the Old Testament is thus closely connected with, but not limited by, Messianic hope, as there are eschatological teachings that are not Messianic. As the Old Testament revelation is concerned primarily with the elect nation, and only secondarily (in the later writings) with the individual persons composing it, we follow the order of importance as well as of time in dealing first with the people. The universalism which marks the promise to the seed of the woman (Gen. iii. 15) appears also in the blessing of Noah (Gen. x. 28). In the promise to Abraham (xiii. 3) this universal good is directly related to God's particular purpose for His chosen people, so also in the blessing of Jacob (xliii.) and of Moses (Deut. xxxiii.). David's last words (2 Sam. xxiii.) blend together his desire that his family should retain the kingship, and his aspiration for a kingdom of righteousness on earth. The conception of the "Day of the Lord" is frequent and prominent in the prophets, and the sense given to the phrase by the people and by the prophets throws into bold relief the contrast between popular beliefs and the prophetic faith. The people simply expected deliverance from their miseries and burdens by the intervention of Yahweh, because He had chosen Israel for His people. The prophets had an ethical conception of Yahweh; the sin of His own people and of other nations called for His intervention in judgment as the moral ruler of the world. But judgment they conceived as preparing for redemption. The day of the Lord is at hand, the eschatological conception, as the term is applied to the final and universal judgment, and not to any less decisive intervention of God in the course of human history. In the pre-exilic prophets the judgment of God is "primarily on Israel, although it also embraces the nations"; during the Exile and at the Restoration the judgment is represented as falling on the nations while redemption is being wrought for God's people; after the Restoration the people of God is again threatened, but still the warning of judgment is mainly directed towards the nations and deliverance is promised to Israel. As the manifestation of God in grace as well as judgment, the day of the Lord will bring joy to Israel and even to the world. A day of judgment it is accompanied by terrible convulsions of nature (not to be taken figuratively, but probably intended literally by the prophets in accordance with their view of the absolute subordination of nature to the divine purpose for man). It ushers in the Messianic age. While the moral issues are finally determined by this day, yet the world of the Messianic age is painted with the colours of the prophet's own surroundings. Israel is restored to its own land, and to it the other nations are brought into subjugation, by force or persuasion. The contribution of this idea to Christian eschatology embraces these features: (1) The manifestation or advent of God; (2) the universal judgment; (3) behind the judgment the coming of the perfect kingdom of the Lord, when all Israel shall be saved and when the nations shall be partakers of their salvation; and (4) the finality and eternity of this condition, that which constitutes the blessedness of the saved people being the Presence of God in the midst of them—this last point corresponding to the Christian idea of heaven" (A. B. Davidson, in Hastings's Bible Dictionary, i. p. 738). This hope is for the people on this earth though transfigured.

To the individual it would seem at first only old age is promised (Is. lxv. 20; Zech. viii. 4), but the abolition of death itself is also declared (Is. xxvi. 8). The resurrection, which appears at first as a revival of the dead nation (Hos. vi. 2; Ez. xxxvii. 12-14), is afterwards promised for the pious individuals (Is. xxv. 19), so that they too may share in the national restoration. The idea is developed in Daniel xii. 2, where the resurrection is described as a resurrection to life, to "eternal life," and as the resurrection of the wicked is described by the prophet as "to shame and everlasting contempt" as well as of the righteous to "eternal life." It was only at the Exile, when the nation ceased to be, that the worth of the individual came to be recognized, and the hopes given to the nation were claimed for the individual. In dealing with the individual eschatology we must carefully distinguish the popular ideas regarding death and the hereafter which Israel shared with the other Semitic peoples in from the intuitions, aspirations, evoked in the pious by the divine revelation itself. The former have not the moral significance or the religious value of the latter. The starting-point of the development was the common-belief that the dead continued to exist in an unsubstantial mode of life, but cut off from fellowship with God and man; but faith left this far behind. Sheol is the common abode of the righteous and the ungodly: life there is shadowy and feeble, but seems to continue in a wavering and dim reflection features of this life. As the present life, however, determined moral issues, and as death does not change man's relation to God, moral considerations could not be absolutely excluded from the future life. A forward step had to be taken. Pious men, in fellowship with God, when they faced the fact of death, were led either to challenge its right, or to give a new meaning to it. Either there was a protest against death itself, and a demand for immortality (Ps. xvi. 9-11), or death was conceived as something different for the saint and for the sinner; fellowship with God would not and could not be interrupted (Ps. xlix. 14, 15, lxxiii. 17-28). The vision of God is anticipated after death's sleep (Ps. xvi. 15; Job xix. 25-27). This belief in individual immortality is expressed poetically and obscurely: it is later than the eschatology of the people. It assumes the moral distinction of the righteous and the ungodly, and seeks a solution for the problem of the lack of harmony of present character and condition. Its deepest motive, however, is religious. The soul in fellowship with God cannot even by death be separated from God. The individual hoped that he would live to share the nation's good, and thus the two streams of Old Testament eschatology at last flow together.

It is in the apocryphal and apocalyptic literature of Judaism that the fullest development of eschatology can be traced. Four words may serve to express the essence of the doctrine of these writings and the teaching of the Old Testament. Eschatology was universalized (God was recognized as the creator and moral governor of all the world), individualized (God's judgment was directed, not to nations in a future age, but to individuals in a future life),
ESCHATOLOGY

transcendentalized (the future age was more and more contrasted with the present, and the transition from the one to the other was not expected as the result of historical movements, but of miraculous divine acts), and dogmatised (the attempt was made to systematize in some measure the vague and varied prophetic anticipations). Only a very brief summary of the current apocalyptic writings can be given. The coming of the Messiah will be preceded by the Last Woes. The Messiah is very variously conceived: (1) "a passive, though supreme member of the Messianic Kingdom"; (2) "an active warrior who slays his enemies with his own hand"; (3) "one who slays his enemies by the word of his mouth, and rules by virtue of his justice, faith and holiness"; (4) a supernatural person, "eternal Ruler and Judge of Mankind" (R. H. Charles in Hastings's Bible Dictionary, p. 746). In some of the writings no Messianic kingdom is looked for; in others only a temporal duration on earth is assigned to it; in others still it abides for ever either on earth as it is, or on earth transformed. The dispersion among the nations is to return home. Sometimes the Resurrection is narrowed down to the resurrection of the righteous, at others widens out to the resurrection of all mankind for the last judgment. A blessed immortality after judgment is the fate of an immortal soul, sometimes taught without reference to any resurrection. Retribution in human history is recognized, but attention is specially concentrated on the final judgment, which is usually conceived as taking place in two stages. (1) The Messianic age is executed by the Messiah or the saints by victory in war, or by judicial sentence. (2) The final remains in God's hands; but in one writing (the Ethiopian Enoch) is represented as Messiah's function. This judgment either closes the Messianic age, if thought of as temporal, or ushered it in, if conceived as eternal, as closes the world's history if no Messianic age is expected. The place of torment for the wicked was called Gehenna (the valley of Hinnom or the Sons of Hinnom, where the bodies of criminals were cast out, is described in Is. lvii. 24). Here corporal as well as spiritual punishment was endured; it was inflicted on apostate Jews or the wicked generally; the righteous witnessed its initial stages but not its final form. In later Judaism it was the purgatory of faithless Jews, who at last reached Paradise, but it remained the place of eternal torment for the Gentiles. Paradise was sometimes regarded as the division of Sheol to which the righteous passed after death, but at others it was conceived as the heavenly abode of Moses, Enoch and Elijah, to which other saints would pass after the last judgment.

The eschatology of the New Testament attaches itself not only to that of the Old Testament but also to that of contemporary Judaism, but it avoids the extravagances of the apocalyptic conceptions and the dogmatization.

Not at all systematic, it is occasional, practical, poetical and dominantly evangelical, laying stress on the hope of the righteous rather than the doom of the wicked.

The teaching of Jesus centres, according to the Synoptists, in the great idea of the "Kingdom of God," which is already present in the teacher Himself, but also future as regards its completion. In some parables a gradual realization of the kingdom is indicated (Matt. xiii.); in other utterances its consummation is connected with Christ's own return, His Parousia (Matt. xxix. 37, 39), the time of which, however, is unknown even to Himself (Mark xiii. 32). In this eschatological discourse (Matt. xxiv., xxv.) He speaks of the destruction of Jerusalem and of the end of the world as near, and seemingly as one. This is in accordance with the characteristic of prophecy, which sees in "timeless sequence" events which are historically separated from one another. While the Return is represented in the Synoptists as a single event, in the teaching of Peter and James of the Apocalypse it is a process extending over a long period.

The phrase "the times of restoration of all things" (iii. 21) is too vague in itself, and is too isolated in its context to warrant the dogmatic teaching of universalism, although there are other passages which seem to point towards the same goal. While John's Apocalypse is distinctly eschatological, the Epistles and the Gospels often give these conceptions an ethical and spiritual import, without, however, excluding the eschatological. Life is
in the 2nd century rejected the Apocalypse on account of its chiliastic, its teaching of a visible reign of Christ on earth for a thousand years. Montanism also brought these apocalyptic expectations into discredit in orthodox ecclesiastical circles. The Alexandrian theology strengthened this movement against chiliastic. Clement of Alexandria taught that justice is not merely retributive, that punishment is remedial, that probation continues after death till the final judgment, that Christ and the apostles preached the Gospel in Hades to those who lacked knowledge, but whose heart was right, that a spiritual body will be raised. Origen taught that a germ of the spiritual body is present in the present body, and its development depends on the character, that perfect bliss is reached only by stages, that the evil are purified by pain, conscience being symbolized by fire, and that all, even the devil himself, will at last be saved. Both regarded chiliasm with aversion. But in the 5th century there were rejected as heretical (1) the doctrine of universalism, and the possibility of the redemption of the devil; (2) the doctrine of the complete annihilation of evil; (3) the conception of the penalties of hell as tortures of conscience; (4) the spiritualizing version of the resurrection of the body; (5) the idea of the continued creation of new worlds” (A. Harnack, History of Dogma, iii. p. 186).

Epiphanius, following Methodius, insisted on the most perfect identity between the resurrection body and the material body; and this belief, enforced in the West by Jerome, soon established itself as alone orthodox. Augustine made experiments on the flesh of a peacock in order to find physical evidence for the resurrection. He held fast to eternal punishment, but allowed the possibility of mitigations. Some believers, he taught, might pass through purgatorial fires; and this middle class may be helped by the sacraments and the alms of the living. “There are many souls not good enough to dispense with this provision, and not bad enough to be benefited by it” (op. cit. v. 233). This doctrine was sanctioned and developed by Gregory the Great. “After God has changed eternal punishments into temporary, the justest must expiate these temporary penalties for sin in purgatory” (p. 485). This view was inferred indirectly from Matt. xii. 31, and directly from 1 Cor. iii. 12-15. Afterwards purgatory took more and more the place of hell, and was subject to the control of the church. As regards the saints, different degrees of blessedness were recognized; they were supposed to wait in Hades for the return of Christ, but gradually the belief gained ground, especially in regard to the martyrs, that their souls at once entered Paradise. The primitive Christian eschatology was preserved into the New Testament, and in times of exceptional distress the expectation of Antichrist emerged again and again. In the middle ages there was an extravagance of speculation on this subject, which may be seen in the last division of Aquinas’s Summa Theologiae. He proposes thirty questions on these matters, among which are the following: “whether souls are conducted to heaven or hell immediately after death”; “whether the limbus of hell is the same as Abraham’s bosom”; “whether the sun and moon will be really obscured at the day of judgment”; “whether all the members of the human body will rise with it”; “whether the hair and nails will reappear”; could thought become “more lawless and uncertain”?

While rejecting purgatory, Protestantism took over this eschatology. Souls passed at once to heaven or to hell; a doctrine even less adequate to the complex quality of human life. Luther himself looked for the passing away of the present evil world. Socinianism taught a new spiritual body, an intermediate state in which the soul is near non-existence, an annihilation of the wicked, as immortality is the gift of God. Swedenborg discards a physical resurrection, as at death the eyes of men are opened to the spiritual world in which we exist now, and they continue to live essentially as they lived here, until by their affinities they are drawn to heaven or hell. The doctrine of eternal punishment has been opposed on many grounds, such as the disproportion between the offense and the penalty, the moral
and religious immortality of the majority of men at death, the diminution of the happiness of heaven involved in the knowledge of the endless suffering of others (Schleiermacher), the defeat of the divine purpose of righteousness and grace that the continued antagonism of any of God’s creatures would determine. God as Father must feel until His whole family is restored. It has been argued that the term “eternal” has reference not to duration of time but quality of being (Maurice); but it does seem certain that the writers in the Holy Scriptures who used it did not foresee an end either to the life or to the death to which they applied the term. The consequence should not be based on the meaning of a single word, but on such broader considerations as have been indicated above. The exterior condition of death and the condition of the soul were guarded by Archbishop Whately, and has been most persistently advocated by Edward White, who “maintains that immortality is a truth, not of reason, but of revelation, a gift of God” bestowed only on believers in Christ; but he admits a continued probation after death for such as have not hardened their hearts by a rejection of Christ. According to Albrecht Ritschl the wrath of God means the resolve of God to annihilate those men who finally oppose themselves to redemption, and the final purpose of the kingdom of God.” He thus makes immortality conditional on inclusion in the kingdom of God. The doctrine of universal restoration was maintained by Thomas Erskine of Linlathen on the ground of the Fatherhood of God, and Archdeacon Wilson anticipates such discipline after death as will restore all souls to God. C. I. Nitzsch argues against the doctrine of the annihilation of the wicked, regards the teaching of Scripture about eternal damnation as hypothetical, and thinks it possible that Paul reached the hope of universal restoration. I. A. Dorrer maintains that hopeless perdition can be the penalty only of the deliberate rejection of the Gospel, that those who have not had the opportunity of choice fairly and fully in this life will get it hereafter, but that the right choice will in all cases be made we cannot be confident. The attitude of theologians generally regarding individual destiny is well expressed by Dr. James Orr, “The conclusion I arrive at is that we have not the elements of a complete solution, and we ought not to attempt it. What visions beyond may be there, what larger hopes, what ultimate harmonies, if such there are in store, will come in God’s good time; it is not for us to anticipate them, or lift the veil where God has left it down” (The Christian View of God and the World, 1893, p. 397).

Although in recent theological thought attention has been mainly directed to individual destiny, yet the other elements of Christian eschatology must not be altogether passed over. History has offered the authoritative commentary on the prophecy of the Parousia of Christ. The presence and power of His Spirit, the spread of His Gospel, the progress of His kingdom have been as much a fulfillment of the eschatological teaching of the New Testament as His life and work on earth were a fulfillment of Messianic prophecy, for fulfillment always transcends prophecy. Even if the common beliefs of the apostolic age have not modified the evangelist’s reports of Jesus’ teaching, it must be remembered that He used the common prophetic phraseology, the literal fulfillment of which is not to be looked for. Some parables (the leaven, the mustard seed) suggest a gradual progressive realization of His kingdom. The Fourth Gospel interprets both judgment and resurrection spiritually. Accordingly the general resurrection and the last judgment may be regarded as the temporal and local forms of thought to express the universal permanent truths that life survives death in the completeness of its necessary organs and essential functions, and that the character of that continued life is determined by personal choice of submission or antagonism to God’s purpose of grace in Christ, the perfect realization of which is the Christian’s hope for himself, mankind and the world.

Bibliography.—In addition to the works referred to above the following will be found useful: S. D. H. Saldman, The Fate of the Dead (1886); D. R. H. Chalmers, A Critical History of the Doctrine of a Future Life in Israel, in Judaism, and in Christianity (1899); L. P. Dahle, Life after Death and the Future of the Kingdom of God (Eng. tr. by J. Beveridge, 1896); J. A. Beet, The Last Things (new ed., 1905); W. G. T. Shedd, Doctrine of Future Punishment (2nd ed., 1869); E. Hope (1802); E. Pétavel, The Problem of Immortality (Eng. tr. by F. A. Freer, 1892); E. White, Life in Christ (3rd ed., 1879); also the relevant sections in books on biblical and systematic theology.

ESCHER (O. Fr. eschele, from esceheor, to fail to one's share; Lat. excedere, to fall out), in English law, the reversion of lands to the next lord on the failure of heirs of the tenant. "When the tenant of an estate in fee simple dies without having alienated his estate in his lifetime or by his will, and without leaving any heirs either lineal or collateral, the lands in which he held his estate escheat, as it is called, to the lord of whom he held them" (Williams on the Law of Real Property). This rule is explained by custom and practice. The escheat of wood was formerly held by the freeholder from some lord, the king being lord paramount. (See Estate.) The granter retains an interest in the land similar to that of the donor of an estate for life, to whom the land reverts after the life estate is ended. As there are now few freehold estates traceable to any mesne or intermediate lord, escheats, when they do occur, fall to the king as lord paramount. Besides escheat for defect of heirs, there was formerly also escheat propter delictum tenementi, or by the corruption of the blood of the tenant through attainer consequent on conviction and sentence for treason or felony. The blood of the tenant becoming corrupt by attainer was decreed no longer inheritable, and the effect was the same as if the tenant had died without heirs. The lands, therefore, escheated to the next heir, subject to the superior right of the crown to the forfeiture of the lands,—in the case of treason for ever, in the case of felony for a year and a day. All this was abolished by the Felony Act 1870, which provided for the appointment of an administrator to the property of the convict. Escheat is also an incident of copyhold tenure. Trust estates were not subject to escheat until the Estates Act 1884, but now by that act the law of escheat applies in the same manner as if the estate or interest were a legal estate in corporeal hereditaments.

ESCHENBURG, JOHANN JOACHIM (1745–1820), German critic and literary historian, was born at Hamburg on the 7th of December 1745. After receiving his early education in his native town, he studied at Leipzig and Göttingen. In 1767 he was appointed tutor, and subsequently professor, at the Collegium Carolinum in Brunswick. The title of ‘Hofrat’ was conferred on him in 1786, and in 1814 he was made one of the directors of the Carolinum. He is best known by his efforts to familiarize his countrymen with English literature. He published a series of German translations of the principal English writers, in the field of aesthetics, such as J. Brown, D. Webb, Charles Burney, Joseph Priestley and R. Hurd; and Germany owes also to him the first complete translation (in prose) of Shakespeare’s plays (William Shakespeare’s Schauspiele, 13 vols., Zürich, 1773–1782). This is virtually a revised edition of the incomplete translation published by Wieland between 1762 and 1766. Eschenburg died at Brunswick on the 29th of February 1820.

Besides editing, with memoirs, the works of Hagedorn, Zachariah and other German poets, he was the author of a Handbuch der klassischen Literatur (1785); Entwurf einer Theorie und Literatur der schönen Wissenschaften (1783); Beispielesammlung nur Theorie und Literatur der schönen Wissenschaften (8 vols., 1788–1795); Lehrbuch der Wissenschaftskunde (1792); and Denkmäler altdösterreichs Dichtkunst (1799). Most of these works have passed through several editions. Eschenburg was also a poet of some pretensions, and some of his religious hymns, e.g. Ich will dich noch im Tod erheben and Dir brauch ich, Gott, und wanne nicht, are contained in many hymnals to this day.

ESCHENMAYER, ADAM KARL AUGUST VON (1768–1832), German philosopher and physicist, was born at Neuenburg in Württemberg in July 1768. After receiving his early education at the Caroline academy of Stuttgart, he entered the university of Tübingen, where he received the degree of doctor of medicine. He practised for some time as a physician at Sulz, and then at Kirchheim, and in 1814 he was chosen extraordinary professor of philosophy and medicine at Tübingen. In 1818 he became
ordinary professor of practical philosophy, but in 1836 he resigned and took up his residence at Kirchheim, where he devoted his whole attention to philosophical studies. Eschenmayer's views are largely identical with those of Schelling, but he differed from him in regard to the knowledge of the absolute. He believed that in order to complete the aim of the philosophy of nature, which he called "philosophy," it must be of the "non-philosophy," a kind of mystical illumination by which was obtained a belief in God that could not be reached by mere intellectual effort (see Hofding, *Hist. of Med. Phil.*, Eng. trans. vol. 2, p. 170). He carried this tendency to mysticism into his physical researches, and was led by it to take a deep interest in the phenomena of animal magnetism. He ultimately became a devout believer in demoniacal and spiritual possession; and his later writings are all strongly impregnated with the lower supernatural.

His principal works are—Die Philosophie in ihrem Ubrang zur Nichtphilosophie (1803); Versuch die scheinbaren Magie des allthei- schen Magnetismus aus physiol. und psychischen Gesichten zu erheiren (1816); System der Moralphilosophie (1818): Psychologie im drei Theilen, als empirische, reine, angewandte (1817, ed. 1822); Religionsphilosophie (4 vols., 1818-1824); Die Hegelsche Religionsphilosophie verglichen mit dem christl. Principl (1834); Der Ischario- timus seiner Tag (1839) (directed against Strauss's *Life of Jesus*); Konflikt zwischen Himmel und Hölle, an dem Dämôn eines besessenen Mädchens beobachtet (1837); Grundzüge der Naturphilosophie (1842); Grundzüge der physikalischen Philosophie (1840); and Betrachtungen über den physikalischen Weltbau (1852).

**ESCHER VON DER LINTH, ARNOLD** (1807-1872), Swiss geologist, the son of Hans Conrad Escher (1767-1833), was born at Zürich on the 8th of June 1807. In 1826 he became professor of geology at the École Polytechnique at Zürich. His researches led him to be regarded as one of the founders of Swiss geology. With B. Gruner he produced (1852-1853) the first elaborate geological map of Switzerland. He was the author also of *Geologische Bemerkungen über das nördliche Vorarlberg und einige angrenzende Gebiete*, published at Zürich in 1853. He died on the 12th of July 1872.

**ESCHSCHOLTZ, JOHANN FRIEDRICH** (1793-1831), Russian traveller and naturalist, was born in November 1793, at Dorpat, where he died in May 1831. He was naturalist and physician to Otto von Kotzebue's exploring expedition during 1815-1818. On his return he was appointed extraordinary professor of anatomy (1819) and director of the zoological museum of the university at Dorpat (1822), and in 1823-1826 he accompanied Kotzebue on his second voyage of discovery. He became ordinary professor of anatomy at Dorpat in 1828. Among his publications were the *System der Akadephen* (1829), and the *Zoologischer Atlas* (1829-1833). The botanical genus Escherichia was named in his honour by Bert von Chamisso.

**ESCHWEGER, a town of Germany, in the Prussian province of Hesse-Nassau, on the Werra, and the railway Treysa-Leinfelden, 28 m. S.E. of Cassel. Pop. (1905) 11,112. It consists of the old town on the left, the new town on the right, bank of the Werra, and Brückenhausen on a small island connected with the old and new town by bridges. It is a thriving manufacturing town, its chief industries being leather-making, yarn-spinning, cotton and linen-weaving, the manufactures of cigars, brushes, liquors and oils, and glue and soap-boiling. It has two ancient buildings, the Nikolai-turm, built in 1455, and the old castle. After being part of Thuringia, Eschwege passed to Hesse in 1263. It was recovered by the landgrave of Thuringia in 1388, but soon reverted to Hesse, and it became the residence of one of the branches of the Hessian royal house, a branch which died out in 1655.

**ESCHEWILER, a town of Germany, in the Prussian Rhine province, on the Inde, and the railways Cologne-Herbesthal and Munich-Gladbach-Stolberg, about 8 m. E.N.E. from Aix-la-Chapelle. Pop. (1905) 20,643. The town has an Evangelical and four Roman Catholic churches, a gymnasion and an orphanage. The manufacture of iron and steel goods is carried on; other industries include the manufacture of zinc wares, tanning, distilling and brewing. In the neighbourhood there are valuable coal mines.

See Koch, *Geschichte der Stadt Eschweiler* (Frankfort, 1890).
It is a valuable historical document, and contains a singularly vivid account of an interview with Napoleon. Escoquiz was far too busy to be distracted for his luncheon and merited for the
delusions and follies of himself and his associates. He displays his own vanity, frivolity and futile cleverness with much unconscious humour, but, it is only fair to allow, with some literal dexterity. When the Spanish royal family was
imprisoned by Napoleon, Escoquiz remained with Ferdinand at Valencia. In 1813 he published at Bourges a translation of
Milton's Paradise Lost. When Ferdinand was released in 1814 he came back to Madrid in the hope that his ambition would
now be satisfied, but the king was tired of him, and was moreover resolved never to be subjected by any favourite. After a very
brief period of office in 1815 he was sent as a prisoner to Murcia.

Although he was afterwards recalled, he was again exiled to Ronda, where he died on the 27th of November 1820.

ESCOMBE, HARRY (1838-1890), South African statesman, a member of a Somersetshire family, was born at Notting Hill, London, on the 25th of July 1838, and was educated at St Paul's.

After four years in a stockbroker's office, he emigrated, in 1859, to the Cape. The following year he moved to Natal, and,
and, after trying other occupations, qualified as an attorney. He became recognized as the ablest pleader in the colony, and,
and, in 1872, was elected for Durban as a member of the legislative council, and subsequently was also placed on the executive
council. In 1880 he secured the appointment of a harbour board for Natal, and was himself made chairman. The transformation of
of the town of Durban into a harbour available for ocean liners was done entirely to his energy. In 1888-1889 he defended
Dinizulu and other Zulu chiefs against a charge of high treason. For several years he opposed the grant of responsible government
to Natal, but in 1890 had become convinced of its desirability, and, on its annexation in 1893 he joined the first ministry formed, serving under Sir John Robinson as attorney-general. In February 1897, on Sir John's retirement, Escombe became
premier, remaining attorney-general and also holding the office of minister of education and minister of defence. In the summer of
of that year he was in London with the other colonial premiers at the celebration of the Diamond Jubilee of Queen Victoria, and was made a member of the privy council. Cambridge University conferred upon him the honorary degree of L.L.D. The election that followed his return to Natal proved unfavourable to his policy, and he resigned office (October 1897). Throughout his life he took an active interest in national defence. He was secretary of the Zulu War Volunteers, was concerned in the creation of the Natal Naval Volunteers and received the voluntary long service
decoration. In October 1899 he went to the northern confines of the colony to take part in preparing measures of defence against the invasion by the Boers. He died on the 27th of December 1899.
The Speeches of the late Right Hon. Harry Escombe (Marlitzburg, 1903), edited by J. T. Henderson, contains brief biographical notes by Sir John Robinson and the editor.

ESCORIAL, or ESCORIAL, in Spain, one of the most remarkable buildings in Europe, comprising at once a convent, a church, a palace and a mausoleum. The Escorial is situated 3432 ft.
above the sea, on the south-western slopes of the Sierra de Guadarrama, and thus within the borders of the province of
Madrid and the kingdom of New Castle. By the Madrid-Ávila railway it is 31 m. N.W. of Madrid. The surrounding country is a
sterile and gloomy wilderness exposed to the cold and blighting blasts of the Sierra.

According to the usual tradition, which there seems no sufficient reason to reject, the Escorial owes its existence to a vow made by Philip II. of Spain (1556-1598), shortly after the battle of St Quentin, in which his forces succeeded in routing the army of France. The day of the victory, the 10th of August 1557, was sacred to St Laurence; and accordingly the building was dedicated to that saint, and received the title of El real monasterio de la reina de la Escorial. The structure that was derived from the little hamlet in the vicinity which furnished shelter, not only to the workmen, but to the monks of St Jerome
who were afterwards to be in possession of the monastery; and the hamlet itself is generally but perhaps erroneously supposed to be indebted for its name to the scorbut or root of certain old iron mines. The preparation of the plans and the super-
intendence of the work were entrusted by the king to Juan Bautista de Toledo, a Spanish architect who had received most of
his professional education in Italy. The first stone was laid in April 1563; and under the king's personal inspection the work
rapidly advanced. Abundant supplies of berrugueca, a granite-
like stone, were obtained in the neighbourhood, and for rarer materials the resources of both the Old and the New World were
out under contribution. The death of Toledo in 1567 threatened a fatal blow at the satisfactory completion of the enterprise, but a worthy successor was found in Juan Herrera, Toledo's favourite pupil, who adhered in the main to his master's designs. On the 13th of September 1584 the last stone of the
masonry was laid, and the works were brought to a termination in 1593. Each successive occupant of the Spanish throne has
done something, however slight, to the restoration or adornment of Philip's convent-palace, and Ferdinand VII. (1808-1833) did
so much in this way that he has been called a second founder. In all its principal features, however, the Escorial remains what
it was made by the genius of Toledo and Herrera working the
grand, if abnormal, desires of their master.
The ground plan of the building is estimated to occupy an area of 396,782 sq. ft., and the total area of all the storeys would form
a causeway 1 metre in breadth and 93 m. in length. There are
seven storeys, fifteen general and, including cellars and cupolas, no less than 12,000 windows and doors. The general arrange-
ment is shown by the accompanying plan. Entering by the main entrance the visitor finds himself in an atrium, called the Court of the Kings (Patio de los reyes), from the 16th-century statues of the kings of Judah, by Juan Bautista Monegro, which adorn
the façade of the church. The sides of the atrium are
unfortun-
ately occupied by plain ungainly buildings five storeys in height, awkwardly accommodating themselves to the upward slope of
the ground. Of the grandeur of the church itself, however, there can be no question: it is the finest portion of the whole
Escorial, and, according to Fusonsson, deserves to rank as one of the
great Renaissance churches of Europe. It is about 340 ft. from east to west by 200 from north to south, and thus occupies
an area of about 70,000 sq. ft. The dome is 60 ft. in diameter, and its height at the centre is about 360 ft. In glaring contrast to the bold and simple forms of the architecture, which belongs
in the classical and Baroque styles, was composed of marble statues and pictures of the high altar, the masterpiece of the Milanese Giacomo Trezzo, almost ruined by the French in 1808. Directly under the altar is situated the pantheon or royal mausoleum, a richly decorated octagonal chamber with upwards of twenty niches, occupied by black marble urnas or sarcophagi, kept sacred for the dust of kings or mothers of kings. There are the remains of Charles V. (1516-1556), of Philip II., and of all their successors on the Spanish throne down to Ferdinand VII., with the ex-
ception of Philip V. (1700-1746) and Ferdinand VI. (1746-1759). Several of the sarcophagi are still empty. For the other members of
the royal family there is a separate vault, known as the Panteon de los Infantes, or more familiarly by the dreadful suggestion name of El Pudriadero. The most interesting room in the palace is
Philip II.'s cell, from which through an opening in the wall he could see the celebration of mass while too ill to leave his bed.

The library, situated above the principal portico, was at one
time one of the richest in Europe, comprising the king's own
collection, the extensive bequest of Diego de Mendoza, Philip's ambassador to Rome, the spoils of the emperor of Morocco, Muley Zidan (1603-1628) and various contributions from
churches of churches and cities. It suffered greatly in the fire of 1671, and has since been impoverished by plunder and neglect. Among its curiosities still extant are two New Testament Codices of the 10th century and two of the 11th; various works by Alphonso the Wise (1251-1284); a Virgil; and, according to Los Alamos of the 15th, &c. Of the Arabic manuscripts which it contained in the
17th century a catalogue was given in J. H. Hottinger's
1. Principal entrance and portico.
2. Court of the kings (Patio de los reyes).
4. Choir of the seminarists.
5. Centre of the church and projection of the dome.
7. High altar.
10. Chapel of St. Maurice.
12. Tomb of Louis Carlota.
13. Chapel of the Patrocinio.

Views and Plan of the Escorial.

15. Chapel of the Eleven Thousand Virgins.
16. Former Chapel of the Patrocinio.
17. Sacristy.

PALACE
18. Principal court of the palace.
19. Ladies' tower.
20. Court of the masks.
22. Royal oratory.
23. Oratory where Philip II died.

SEMINARY
24. Entrance to seminary.
25. Classrooms.
26. Old philosophical hall.
27. Old theological hall.
28. Chamber of secrets.
29. Old refectory.
30. Entrance to the college.
31. College yard.

CONVENT
32. Clock tower.
33. Principal cloister.
34. Court of the evangelists.
35. Prior's cell.
36. Archives.
37. Old church.
38. Visitors' hall.
40. Convent refectory.

Promptuarium sine bibliotheca orientalis, published at Heidelberg in 1558, and another in the 18th, in M. Casiri's Bibliotheca Arabico-Hispanico (2 vols., Madrid, 1760-1770). Of the artistic treasures with which the Escorial was gradually enriched, it is sufficient to mention the frescoes of Peregrin or Pellarino Tibaldi, Luis de Carbalaj, Bartolomeo Carducci or Carducho, and Luca Giordano, and the pictures of Titian, Tintoretto and Velasquez. These paintings all date from the 15th or the 17th century. Many of those that are movable have been transferred to Madrid, and many others have perished by fire or sack. The conflagration of 1671, already mentioned, raged for fifteen days, and only the church, a part of the palace, and two towers escaped uninjured. In 1808 the whole building was exposed to the ravages of the French soldiers under General La Houssaye. On the night of the 1st of October 1872, the college and seminary, a part of the palace and the upper library were devastated by fire; but the damage was subsequently repaired. In 1885 the conventual buildings were occupied by Augustinian monks.

The reader will find a remarkable description of the emotional influence of the Escorial in E. Quinet's Vacaciones en Espana (Paris, 1846), and for historical and architectural details he may consult the following works—Fray Juan de San Jeronimo, Memorias sobre la fundacion del Escorial y su fabrica, in the Coleccion de documentos ineditos para la historia de España, vol. viii.; Y. de Herrera, Sumario y breve declaracion de las obras y estampas de la fab. de S. Lorenzo el Real del Escorial (Madrid, 1889); José de Sigenza, Historia de la orden de San Jeronimo, 2c. (Madrid, 1590).

1 Reduced from a large plan of the Escorial in the British Museum, Monasterio del Escorial, published at Madrid in 1876.
was given after four o'clock, however, an appeal was lodged, and the House of Commons allowed both members to take their seats. Brett rapidly made his mark in the House, and in 1868 he was appointed solicitor-general. On behalf of the crown he prosecuted the Fenians charged with having caused the Clerkenwell explosion. In parliament he took a leading part in the promotion of bills connected with the administration of law and justice. He was (August 1868) appointed a justice in the court of common pleas. Some of his sentences in the case of the gas-stokers excited much criticism, notably so in the case of the gas-stokers' strike, when he sentenced the defendants to imprisonment for twelve months, with hard labour, which was afterwards reduced by the home secretary to four months. On the reconstitution of the court of appeal in 1876, Brett was elevated to the rank of a lord justice. After holding this position for seven years, he succeeded Sir George Jessel as master of the rolls in 1883. In 1885 he was raised to the House of Lords as Baron Ether. He opposed the bill proposing that an accused person or his wife might give evidence in their own case, and supported the bill which empowered lords of appeal to sit and vote after their retirement. The Solicitors Act of 1888, which increased the powers of the Incorporated Law Society, owed much to his influence. In 1880 he delivered a remarkable speech in the House of Lords, deprecating the delay and expense of trials, which he regarded as having been increased by the Judicature Acts. Lord Ether suffered perhaps as master of the rolls from succeeding a lawyer of such eminence as Jessel. He had a caustic tongue, but also a fund of shrewd common sense, and one of his favourite considerations was whether a certain course was "business" or not. He retired from the bench at the close of 1897, and a vicesounty was conferred upon him on his retirement, a dignity never given to any judge, lord chancellors excepted, "for mere legal conduct since the time of Lord Coke." He died in London on the 24th of May 1899.

Lord Ether was succeeded in the title by his only surviving son, Reginald Baliol Brett (b. 1852), who was secretary to the office of works from 1895 to 1902, but subsequently came into far greater public prominence in 1904 as chairman of the war office reconstitution committee after the South African War.

ESHER, a township in the Epsom parliamentary division of Surrey, England, 145 m. S.W. of London by the London & South Western railway (Esher and Claremont station). It is pleasantly situated on rising ground above the river Mole, 3 m. from its junction with the Thames. To the north-west lie the grounds of Esher Place. Of the mansion-house founded by William of Waynflete, bishop of Winchester (c. 1450), in which Cardinal Wolsey resided for three or four weeks after his sudden fall from power in 1529, only the gatehouse remains. It is known as Wolsey's Tower, but is apparently part of Waynflete's foundations. A new mansion was erected in 1603. To the south is Claremont Palace, built by the great Lord Clive (1780) on the site of a mansion of Sir John Vanbrugh. In 1816 it was the residence of Princess Charlotte, wife of Prince (afterwards King) Leopold. She died here in 1817, and on the death of her husband in 1863 the property passed to the crown. Louis Philippe, exking of the French, resided here from 1848 until his death in 1850. In 1882 Claremont became the private property of Queen Victoria. Christ Church, Esher, contains fine memorials of King Leopold and others, and one of its three bells is said to have been brought from San Domingo by Sir Francis Drake. To the north near the railway station is Sandown Park, where important race meetings are held. Esher is included in the urban district of Esher and The Dittons, of which Thames Ditton is a favourite riverside resort. The whole district is largely residential. Pop. (1901) 9489.

ESKER (O. Irish eiscir), a local name for long mounds of gravel, frequently found in Ireland. Eskers (the Swedish älar) are among the occasionally puzzling relics of the British glacial period. They wind from side to side across glaciated country and have evidently been formed by channels upon or under the ice. "Where streams of considerable size form tunnels under or in the ice these may become more or less filled
with wash, and when the ice melts the aggraded channels appear as long ridges of gravel and sand known as eskers. It has been thought that similar ridges are sometimes formed in valleys cut in the ice from top to bottom, and even that they rise from gravel and sand lodged in super-glacial channels. The latter at least is probably rare, as the surface streams have usually high gradients, swift currents and smooth bottoms, and hence give little opportunity for lodgement. In the case of ice-sheets too, in which eskers are chiefly developed, there is usually no surface material except at the immediate edge, where the ice is thin and its layers upturned " (T. C. Chamberlin and R. D. Salisbury, *Geology, Processes and their Results*). Eskers are to be distinguished from kames (q.v.).

**ESKILSTUNA,** a town of Sweden in the district (län) of Södermanland, on the Hjelmar river, which unites lakes Hjelmar and Målar, 65 m. W. of Stockholm by rail. Pop. (1900) 3,683.

The place is mentioned in the 13th century, and is said to derive its name from Eskil, an English missionary who suffered martyrdom on the spot. It rose into importance in the reign of Charles X., who bestowed on it considerable privileges, and gave the first impulse to its manufacturing activity. It is the chief seat in Sweden of the iron and steel industries, its cutlery being especially noted, while damascened work is a specialty. There is a technical school for the metal industries. There are, in the town or its neighbourhood, great engine works, gun-making works, rolling and polishing works and breweries. The largest mechanical works are those of Munktel and Tunafors. The Karl Gustaf Stads rifle factory was established in 1814.

**ESKIMO, ESKIMOS of LESQUAMAX** (a corruption of the Abnaki Indian *Eskimantisc* or the Ojibway *Askhimiq*, both terms meaning " those who eat raw flesh": they call themselves " Innuit," " the people "), a North American Indian people, inhabiting the arctic coast of America from Greenland to Alaska, and a small portion of the Asiatic shore of Bering Strait. On the American shores they are found, in broken tribes, from East Greenland to the western shores of Alaska—never far inland, or south of the region where the winter ice allows seals to congregate. Even on hunting expeditions they never travel more than 30 m. from the coast. Save a slight admixture of European settlers, they are the only inhabitants of both sides of Davis Strait and Baffin Bay. They extend as far south as about 50° N. lat. on the eastern side of America, and in the west to 60° on the eastern shore of Bering Strait, while 55° to 60° are their southern limits on the shore of Hudson Bay. Throughout all this range there are no other tribes save where the Kenyan and Ugalenzi Indians (of western America) come down to the shore to fish. The Aleutians are closely allied to the Eskimo in habits and language. H. J. Rink divides the Eskimo into the following groups, the most eastern of which would have to travel nearly 12,000 miles, the most western 6,000: The East Greenland Eskimo, few in number, every year advancing farther south, and coming into contact with the next section. (2) The West Greenlanders, civilized, living under the Danish crown, and extending from Cape Farewell to 74° N. lat. (3) The Northernmost Greenlanders—the Arctic Highlanders of Sir John Ross—confined to Smith, Whale, Murchison and Wolstenholme Sounds, north of the Melville Bay glaciers. These—the most isolated and savage of the Eskimo tribes—are made to accommodate several families, but as a rule each family has a house to itself. The Eskimo are solely hunters and fishers, and derive most of their food from the sea. Their country allows of no cultivation; and beyond a few berries, roots, &c., they use no vegetable food. The seal, the reindeer and the whale supply the bulk of their food, as well as their clothing, light, fuel, and frequently also, when driftwood is scarce or unavailable, the material for the articles of domestic economy. Thus the Eskimo canoe is made of seal-skin stretched on a frame of various colours, rain, with a hole in the centre for the paddler. It is driven by a bone-tipped double-bladed paddle. A waterproof skin or entrail dress is tightly fastened round the mouth of the hole so that, should the canoe overturn, no water can enter. A skillful paddler can turn a complete somersault, boat and all, through the water.

Eyes rather obliquely set, small, black and bright; head largish, and covered with coarse black hair, which the women fasten up into a knot on the top, and the men clip in front and allow to hang loose and unkempt behind. Their skulls are of the mesocephalic type, the height being greater than the breadth; according to Davis, 75 is the index of the latter and 77 of the former. Some of the tribes slightly compress the skulls of their boys, who are known as "pulla," but this practice is a very local one. The men have usually a slight moustache, but no whiskers, and rarely any beard. The skin has generally a "bacony" feel, and when cleaned of the smoke, grease and other dirt—the accumulation of which varies according to the age of the individual—is only so slightly brown that red shows in the cheeks of the children and young women. The hands and feet are small and well formed. The Eskimo dress entirely in skins of the seal, reindeer, bear, dog, or even fox, the first two being, however, the most common. The men's and women's dress is much the same, a jacket suit, the trousers tucked into seal-skin boots. The jacket has a hood, which in cold weather is used to cover the head, leaving only the face exposed. The women's jacket has a large hood for carrying a child and an absurd-looking tail behind, which is, however, usually tucked up. The women's trousers are usually ornamented with eider-duck neck feathers or embroidery of native dyed leather; their boots, which are of white leather, or (in Greenland) gun-skin, dyed black, coming over the knees, and in some tribes are very wide at the top, thus giving them an awkward appearance and a clumsy waddling walk. In winter two suits are worn, one with the hair inside, the other with it outside. They also sometimes wear shirts of bird-skins, and stockings of dog or young reindeer skins. Their clothes are very neatly made, fit beautifully, and are sewn with "sinew-thread," with a bone needle if a steel one cannot be had. In person the Eskimo are usually filthy, and never wash. Infants are, however, sometimes cleaned by being licked by their mother before being put into the bag of feathers which serves as their bed, cradle and blankets.

In summer the Eskimo live in conical skin tents, and in winter usually in half-underground huts of stone, turf, earth and bones, entered by a long tunnel-like passage, which can only be traversed on all fours. Sometimes, if residing temporarily at a place, they will erect near round huts of blocks of snow with a sheet of ice for a window. In the roof are deposited their spare harpoons, &c.; and from it is suspended the steatite basin-like lamp, the flame of which, the wick being of moss, serves as fire and light. On one side of the hut is the bench which is used as sofa, seats and common sleeping place. The floor is usually very filthy, a pool of blood or a dead seal being often to be seen there. Ventilation is almost non-existent; and after the lamp has biased for some time, the heat is all but unbearable. In the summer the Eskimo wear the "barongs" or "caische". The Eskimo live in the winter in the tunnel-like passage just outside the family apartment. The Western Eskimo build their houses chiefly of planks, merely covered on the outside with green turf. The same Eskimo have, in the more populous places, a public room for meetings. "Council chambers" are also said to exist in Labrador, but are only known in Greenland by tradition. Sometimes in south Greenland and in the Western Eskimo country the Eskimos build boats to accommodate several families, but as a rule each family has a house to itself.

The Eskimo are solely hunters and fishers, and derive most of their food from the sea. Their country allows of no cultivation; and beyond a few berries, roots, &c., they use no vegetable food. The seal, the reindeer and the whale supply the bulk of their food, as well as their clothing, light, fuel, and frequently also, when driftwood is scarce or unavailable, the material for the articles of domestic economy. Thus the Eskimo canoe is made of seal-skin stretched on a frame of various colours, rain, with a hole in the centre for the paddler. It is driven by a bone-tipped double-bladed paddle. A waterproof skin or entrail dress is tightly fastened round the mouth of the hole so that, should the canoe overturn, no water can enter. A skillful paddler can turn a complete somersault, boat and all, through the water.

IX. 25
The Eskimo women use a flat-bottomed skin luggage-boat. The Eskimo slide is made of two runners of wood or bone—even, in one case on record, of frozen salmon (Maclure) —unitcd by cross bars tied to the runners by hide thongs, and drawn by four to eight dogs harnessed abreast. Some of their weapons are of bone, and the skin bags (Kiuk, masinuk, with a rope point to which an inflated sealskin is fastened. When the quarry is struck, the floating skin serves to tire it out, makes its course, and buoy it up when dead. The bird-spears, too, have a blader attached, and points at the sides which strike the creature should the spear-head fail to wound. An effective bow is made out of whale's rib. Altogether, with meagre material the Eskimo show great skill in the manufacture of their weapons. Meat when boiled is eaten, but, when it is frozen, it is often eaten raw. Blood, and the half-digested contents of the reindeer's paunch, are also eaten; and sometimes, but not habitually, blubber. As a rule this latter is too precious: it must be kept for winter fuel and light. The Eskimo are enormous eaters; two will easily dispose of a seal at a sitting; and in Greenland, for instance, each individual has for his daily consumption, on an average, 2½ lb of flesh with blubber, and 1 lb of fish, besides mussels, berries, blue-berries, &c., which in the Danish settlements are added 2 oz of imported food. Ten pounds of flesh, in addition to other food, is not uncommonly consumed in a day in time of plenty. A man will lie on his back and allow his wife to feed him with tit-bits of blubber and flesh until he is unable to move.

The Eskimo cannot be strictly called a wandering race. They are nomadic only in so far that they have to move about from place to place during the fishing and shooting season, following the game in its migrations. They have, however, no regular property. They possess only the most necessary utensils and furniture, with a stock of provisions for less than one year; and these possessions never exceed certain limits fixed upon by tradition or custom. Long habit and the necessities of their life have also compelled those having food to share with those having none—a custom which, with others, has conducted to the stagnant conditions of Eskimo society and to their utter improvidence.

Their intelligence is considerable, as their implements and folk-tales abundantly prove. They display a taste for music, cartography and drawing, display no small amount of humour, are quick at picking up peculiar traits in strangers, and are painfully acute in detecting the weak points or ludicrous sides of their character. They are excellent mimics and easily learn the dances and songs of the Europeans, as well as their games, such as chess and draughts. They gamble a little—but in moderation, for the Eskimo, though keen traders, have a deep-rooted antipathy to speculation. When they offer anything for sale—say at a Danish settlement in Greenland—they always leave it to the buyer to settle the price. They have also a dislike to bind themselves by contract. Hence it was long before the Eskimo in Greenland could be induced to enter into European service, though when they do pass to almost the opposite extreme—they have no will of their own. Public licentiousness or indecency is rare among them. In their private life their morality is, however, not high. The women are especially erring; and in Greenland, at places where strangers visit, their extreme laxity of morals, and their utter want of shame, are not more remarkable than the entire absence of jealousy or self-respect on the part of their countrymen and relatives. Theft in Greenland is almost unknown; but the wild Eskimo make very free with strangers' goods—though it must be allowed that the value they attach to the articles stolen is some excuse for the thieves. Among themselves, on the other hand, they are very honest—a result of their being so much under the control of public opinion. Lying is said to be as common a trait of the Eskimo as of other savages in their dealings with Europeans. They have naturally not made any figure in literature. Their folk-lore is, however, extensive, and that collected by Dr Rink shows considerable imagination and no mean talent on the part of the story-tellers. In Greenland and Labrador most of the natives have been taught by the missionaries to read and write in their own language. Altogether, the literature published in the Eskimo tongue is considerable. Most of it has been printed in Denmark, but some has been "set up" in a small printing-office in Greenland, from which about 260 sheets have issued, besides many of a purely official character; and the "Selskabets for samfundsliv i det nordenske, eller tusurumidssossunik umnik, i.e., "something for reading, accounts of all entertaining subjects") has been published since 1861.

The Eskimo in Greenland and Labrador are, with few exceptions, nominally at least, Christians. The native religion is a vague animism, and consists of a belief in good and evil spirits, limited each to its own sphere; in a Heaven and Hell; and a judgment. The idea of a particular (danic: pollesaamak, tummaaamak, tummaaamak) is transferred to the native wizards, who are regarded as intermediaries between mankind and the spirit-powers. The worship of the whale-spirit, so important a factor in their daily economy, is prevalent.

As regards language, the idiom spoken from Greenland to north-eastern Siberia is, with a few exceptions, the same; any difference is only that of dialect. It differs from the whole group of European languages, not merely in the sound of the words, but most especially, according to Rink, in the distribution of stress. Its most remarkable feature is that a sentence of a European language is expressed in Eskimo by a single word constructed out of certain elements, each of which corresponds in some degree to one of our words. One specimen commonly given to visitors to Greenland may suffice: Samiskinsianiarokasuar-omarytilitogok, which is equivalent to "He says that you also will go away quickly in like manner and buy a pretty knife." Here is one word serving in the place of 17. It is made up as follows: Song a knife, t'é pretty, sini buy, artariak go away, avar hasten, omar will, y i like manner, dit thou, log also, og he says.

The Eskimo have no chiefs or political and military rulers. Fabricius concisely described them in his day: "Sine Deo, domino, regniurur konstudum." The government is mainly a family one, though a man distinguished for skill in the chase, and for strength and swiftness, often has considerable power in the village. No political or social tie is recognized between the villages, though general good-fellowship seems to mark their relations. They never go to war with each other; and though revengeful and apt to injure an enemy secretly, they rarely come to blows, and are morbidly anxious not to give offence. Indeed, in their intercourse with each other, all Eskimo indulge in much hyperbolical compliment. But they are not without courage. On the Coppermine and Mackenzie rivers, where they sometimes come into collision with their American and Indian kinsmen, they fight fiercely. Polygamy is rare, but the rights of divorce and re-marriage are unrestricted. The Eskimo have intricate rules governing the ownership of property and the rights of the hunter. As a race they are singularly un demonstrative. When they met each other they used to rub noses together, but this, though a common custom still among the wild Eskimo, is entirely abandoned in Greenland except for the petting of children. There is, in Greenland at least, no national mode of salutation, either on meeting or parting. When a guest enters a house, commonly not the least sign is made either by him or his host. On leaving a place they sometimes say "indvåglarite," i.e. live well, and to a European "aporniaikinait," i.e. do not hurt thy head, viz. against the upper part of the doorway. The Eskimo, excluding the few on the Asiatic coast, are estimated at about 29,000.

ESKI-SHEHR, a town of Asia Minor, in the Kutiah sanjak of the Brusa (Khedavendiklar) vilayet. It is a station on the Haidar Pasha-Angora railway, 1944 m. from the former and 104 m. from Angora, and the junction for Konia; and is situated on the right bank of the Pursak Su (Tembris), a tributary of the Sakaria, at the foot of the hills that border the broad treeless valley. Pop. 20,000 (Moesens 13,000, Christians 5000). Eski-Shehr, i.e. "the old town," lies about a mile from the ruins of the ancient Dorylaion. The town is connected in connexion with the wars of Lysmachus and Antigonus (about 302 B.C.), and frequently figures in Byzantine history as an imperial residence and military rendezvous. It was the scene of the defeat of the Turks under Kilij-Arslan by the crusaders in 1097, and fell finally to the Turks of Konia in 1176. The town is divided by a small stream into a commercial quarter on low ground, in which are the bazaars, khans and the hot sulphur springs (125° F.) which are mentioned as early as the 3rd century by Athenaeus; and a residential quarter on the higher ground. The town is noted for its good climate, the Pursak Su for the abundance of its fish, and the plain for its fertility. About 18 m. to the E. are extensive deposits of meerschaum. The clay is partly manufactured into pipes in the town, but the greater proportion finds its way to Europe and especially to Germany. The annual output is valued at £7,000.000.

See Murray's Handbook to Asia Minor (1893); V. Cuinet, Turquie d'Asie (Paris, 1894).

ESMARCH, JOHANNES FRIEDRICH AUGUST VON (1823-1908), German surgeon, was born at Tönning, in Schleswig-Holstein, on the 9th of January 1823. He studied at Kiel and Göttingen, and in 1846 became B. R. K. von Langenbeck's assistant at the Kiel surgical hospital. He served in the Schleswig-Holstein War of 1848 as junior surgeon, and this directed his attention to the subject of military surgery. He was taken prisoner, but afterwards exchanged, and was then appointed as surgeon to a field hospital. During the truce of 1849 he qualified as Privatdocent at Kiel, but on the fresh outbreak of war he returned to the troops and was promoted to the rank of senior surgeon. In 1854 he became director of the surgical clinic at Kiel, and in 1857 head of the general hospital and professor at the university. During the Schleswig-Holstein War of 1864 Esmarch rendered good service to the field hospitals of Flensburg, Sundewitt and Kiel. In 1866 he was called to Berlin as member of the hospital commission, and also to take the superintendence of the surgical work in the hospitals there. When the Franco-German War broke out in 1870 he was appointed surgeon-general to the army, and afterwards consulting surgeon at the great military hospital near Berlin. In 1873 he married Princess Henrietta of Schleswig-Holstein-Sonderburg-Augustenburg, aunt of the Empress Augusta Victoria. In 1887 a patent of nobility was conferred on him. He died at Kiel on the 15th of February 1908. Esmarch was one of the greatest authorities on hospital management and military surgery. His Handbuch der kriegsschirurgischen Technik was written for a prize offered by the empress Augusta, on the occasion of the Vienna Exhibition of 1877, for the best handbook for the battlefield of surgical appliances and operations. This book is illustrated by admirable diagrams, showing the different methods of bandaging and dressing, as well as the surgical operations as they occur on the battlefield. Esmarch himself invented an apparatus, which bears his name, for keeping a limb nearly bloodless during amputation. No part of Esmarch's work is more widely known than that which deals with "First Aid," his First Aid on the Battlefield and First Aid to the Injured being popular manuals on the subject. The latter is the substance of a course of lectures delivered by him in 1881 to a "Samaritan School," the first of its kind in Germany, founded by Esmarch in 1881, in imitation of the St. John's Ambulance classes which had been established in England in 1878. These lectures were very generally adopted as a manual for first aid students, edition after edition having been called for, and they have been translated into numerous languages, the English version being the work of H.R.H. Princess Christian. No ambulance course would be complete without a demonstration of the Esmarch bandage. It is a three-sided piece of linen or cotton, of which the base measures 4 ft. and the sides 2 ft. 10 in. It can be used folded or open, and applied in thirty-two different ways. It answers every purpose for temporary dressing and field-work, while its great recommendation is that the means for making it are always at hand.

ESNA, or ESNED, a town of Upper Egypt on the W. bank of the Nile, 454 m. S.S.E. of Cairo by rail, the railway station being on the opposite side of the river. The town is mentioned in the Annals of Copta. Esna, one of the healthiest towns in Egypt, is noted for its manufactures of pottery and its large grain and live stock markets. It formerly had a large trade with the Sudan. A caravan road to the south goes through the oasis of Kurkur. The trade, almost stopped by the Mahdist Wars, is now largely diverted by railway and steamboat routes. There is, however, considerable traffic with the oasis of Kharga, which lies almost due west of the town. Nearly in the centre of the town is the Ptolemaic and Roman temple of the ram-headed Khnum, almost buried in rubbish and houses. The interior of the pronaos is accessible to tourists, and contains the latest known hieroglyphic inscription, dating from the reign of Decius (A.D. 249-251). With Khnum are associated the goddesses Satet and Neith. In the neighbourhood are remains of Coptic buildings, including a subterranean church (discovered 1895) in the desert half a mile beyond the limits of cultivation. The name Esna is from the Coptic Sna. By the Greeks the place was called Latopolis, from the worship here of the latus fish. In the persecutions under Diocletian A.D. 303, the Christians of Esna, a numerous body, suffered severely. In later times the town frequently served as a place of refuge for political exiles. The so-called Esna barrage across the Nile (built 1906-1908) is 30 m. higher up stream at Edfu.

ESOTERIC, having an inner or secret meaning. This term, and its correlative "exoteric," were first applied in the ancient Greek mysteries to those who were initiated (σω, within) and to those who were not (φω, outside), respectively. It was then transferred to a supposed distinction drawn by certain philosophers between the teaching given to the whole circle of their pupils and that containing a higher and secret philosophy which was reserved for a select number of specially advanced or privileged disciples. This distinction was ascribed by Lucian (Vit. Ascal. 26) to Aristotle (p.r.), who, however, uses ἄγων (Nic. Ethic) merely of "popular treatises." It was probably adopted by the Pythagoreans and was also attributed to Plato. In the sense of mystic it is used of a secret doctrine of theosophy, supposed to have been traditional among certain disciples of Buddhism.

ESPAGNOLS SUR MER, LES, the name given to the naval victory gained by King Edward III. of England over a Spanish fleet off Winchelsea, on the 28th of August 1350. Spanish ships had fought against England as the allies or mercenaries of France, and there had been instances of piratical violence between the trading ships of both nations. A Spanish merchant fleet was loading cargoes in the Flemish ports to be carried to the Basque coast. The ships were armed and had warships with them. They were all under the command of Don Carlos de la Cerda, a soldier of fortune who belonged to a branch of the Castilian royal family. On its way to Flanders the Spanish fleet had captured a number of English trading ships, and had thrown the crews overboard. Piratical violence and massacre of this kind was then universal on the sea. On the 10th of August, when the king was at Rotherhithe, he announced his intention of attacking the Spaniards on their way home. The rendezvous of his fleet was at Winchelsea, and thither the king went by land, accompanied by his wife and her ladies, by his sons, the Black Prince and John of Gaunt, as well as by many nobles. The king embarked on his flagship, the "Cog Thomas," on the 28th of August. The English fleet did not put to sea but remained at anchor, waiting for the appearance of the Spaniards. Its strength is not known with certainty, but Stow puts it at 50 ships and pinnaces. Carlos de la Cerda was obviously well disposed to give the king a meeting.
He might easily have avoided the English if he had kept well out in the Channel. But he relied on the size and strength of his 40 large ships, and in expectation of an encounter had recruited a body of mercenaries—mostly crossbowmen—in the Flemish ports. In the afternoon of the 20th of August he bore down boldly on King Edward’s ships at anchor at Winchelsea. When the Spaniards hove in sight, the king was sitting on the deck of his ship, with his knights and nobles, listening to his minstrels who played German airs, and to the singing of Sir John Chandos. When the look-out in the tops reported the enemy in sight, the king and his company drank to one another’s health, the trumpet was sounded, and the whole line stood out. All battles at that time, whether on land or sea, were finally settled by stroke of sword. The English steered to board the Spaniards. The king’s own ship was run into by one of the enemies, with such violence that both were damaged, and she began to sink. The Spaniard stood on, and the “Coc Thomas” was laid alongside another, which was carried by boarding. It was high time, for the king and his following had barely reached the deck of the Spaniard before the “Coc Thomas” went to the bottom. Other Spaniards were taken, but the fight was hot. La Cerda’s crossbowmen did much execution, and the higher-built Spaniards were able to drop bars of iron or other weights on the lighter English vessels, by which they were damaged. The combat was continued till twilight. At the close the large English vessel called “La Salle du Roi,” which carried the king’s household, and was commanded by the Fleming, Robert of Namur, afterwards a knight of the Garter, was grappled by a big Spaniard, and was being dragged off by him. The crew called loudly for a rescue, but were either not heard or, if heard, could not be helped. The “La Salle du Roi” would have been taken if a Flemish squire of Robert of Namur, named Hannequin, had not performed a great feat of arms. He hoisted the Spaniard and cut the halyards of her main-sail with his sword. The Spanish ship was taken. King Edward is said to have captured 4 of the enemy. What his own loss was is not stated, but as his own vessel, and also the vessel carrying the Black Prince, were sunk, and from the peril of “La Salle du Roi,” we may conclude that the English fleet suffered heavily. There was no pursuit, and a truce was made with the Basque towns the next day.

The battle with the “Spaniards on the sea” is a very typical example of a medieval sea-fight, when the ships were of the size of a small coaster or a fishing smack, were crowded with men, and when the personal prowess of a single knight or squire was an important element of strength.

The only real authority for the battle is Froissart, who was at different service of King Edward or of his wife, Philip of Hainaut, and of the counts of Namur. He repeated what was told by men who had been present, and dwells as usual on the chivalry of the day, which had lasted more than a quarter of a century, during which time the Progressists, Democrats and advanced Liberals ever looked to him as a leader and adviser. In November 1836 he again forced the Carlists to raise the siege of Bilbao. His troops included the British legion under Sir de Lacy Evans. This success turned the tide of war against Don Carlos, who vainly attempted a raid towards Madrid. Espartero was soon at his heels, and obliged him to hurry northwards, after several defeats. In 1839 Espartero carefully opened up negotiations with Maroto and the principal Carlist chiefs of the Basque provinces. These ended in their accepting his terms under the famous convention of Vergara, which secured the recognition of their ranks and titles for nearly 1000 Carlist officers. Twenty thousand Carlist volunteers laid down their arms at Vergara; only the irremiscible led by Cabrera held out for a while in the central provinces of Spain. Espartero soon, however, in 1840, stamped out the last embryo of chivalry in Spain, which had lasted seventeen years. He was styled “El pacificador de España,” was made a grandee of the first class, and received two dukedoms.

During the last three years of the war Espartero, who had been elected a deputy, exercised from his distant headquarters such influence over Madrid politics that he twice hastened the fall of the cabinet, and obtained office for his own friends. At the close of the war the queen regent and her ministers, including Espartero as commander-in-chief, were forced to elibute to the demands of the people for a pronunciamiento ensued in Madrid and other large towns which culminated in the marshal’s accepting the post of prime minister. He soon became virtually a dictator, as Queen Christina took office at his popularity and resigned, leaving the kingdom very soon afterwards. Directly the Cortes met they elected Espartero regent by 179 votes to 103 in favour of Arguelles, who was appointed guardian of the young queen. For two years Espartero ruled Spain. Child of a carter, who wanted to make him a priest, but the lad at fifteen enlisted in a battalion of students to fight against the armies of Napoleon I. In 1811 Espartero was appointed a lieutenant of Engineers in Cadiz, but having failed to pass his examination he entered a line regiment. In 1813 he went to America as a captain under General Morillo, who had been made commander-in-chief to quell the risings of the colonies on the Spanish Main. For eight years Espartero distinguished himself in the struggle against the colonists. He was several times wounded, and was made major and colonel on the battlefields of Cochabamba and Sapachini. He had to surrender to Sucre at the final battle of Ayacucho, which put an end to Castilian rule. He returned to Spain, and, like most of his companions in arms, remained under a cloud for some time. He was sent to the garrison town of Logroño, where he married the daughter of a rich landowner, Doña Jacinta Santa Cruz, who eventually survived him. Henceforth Logroño became the home of the most prominent of the Spanish political generals of the 19th century. Espartero became in 1832, on the death of King Ferdinand VII, one of the most ardent defenders of the rights of his daughter, Isabella II. The government sent him to the front, directly the Carlist War broke out, as commandant of the province of Biscay, where he severely defeated the Carlists in many encounters. He was quickly promoted to a divisional command, and then made a lieutenant-general. At times he showed qualities as a guerrilero quite equal to those of the Carlists, like Zumalacarregui and Cabrera, by his daring marches and surprises. When he had to move large forces he was greatly superior to them as an organizer and strategist, and he never disgraced his successes by cruelty or needless severity. Twice he obliged the Carlists to raise the siege of Bilbao before their arms were used against the army. On the 17th of September 1836, when the tide of war seemed to be setting in favour of the pretender in the Basque provinces and Navarre, though Don Carlos had lost his ablest lieutenant, the Basque Zumalacarregui. His military duties at the head of the principal national army did not prevent Espartero from showing for the first time his political ambition. He displayed such radical and reforming inclinations that he laid the foundations of his popularity among the lower and middle classes, which lasted more than a quarter of a century, during which time the Progressists, Democrats and advanced Liberals ever looked to him as a leader and adviser. In November 1836 he again forced the Carlists to raise the siege of Bilbao. His troops included the British legion under Sir de Lacy Evans. This success turned the tide of war against Don Carlos, who vainly attempted a raid towards Madrid. Espartero was soon at his heels, and obliged him to hurry northwards, after several defeats. In 1839 Espartero carefully opened up negotiations with Maroto and the principal Carlist chiefs of the Basque provinces. These ended in their accepting his terms under the famous convention of Vergara, which secured the recognition of their ranks and titles for nearly 1000 Carlist officers. Twenty thousand Carlist volunteers laid down their arms at Vergara; only the irremiscible led by Cabrera held out for a while in the central provinces of Spain. Espartero soon, however, in 1840, stamped out the last embryo of chivalry in Spain, which had lasted seventeen years. He was styled “El pacificador de España,” was made a grandee of the first class, and received two dukedoms.

During the last three years of the war Espartero, who had been elected a deputy, exercised from his distant headquarters such influence over Madrid politics that he twice hastened the fall of the cabinet, and obtained office for his own friends. At the close of the war the queen regent and her ministers, including Espartero as commander-in-chief, were forced to elibute to the demands of the people for a pronunciamiento ensued in Madrid and other large towns which culminated in the marshal’s accepting the post of prime minister. He soon became virtually a dictator, as Queen Christina took office at his popularity and resigned, leaving the kingdom very soon afterwards. Directly the Cortes met they elected Espartero regent by 179 votes to 103 in favour of Arguelles, who was appointed guardian of the young queen. For two years Espartero ruled Spain. Child of a carter, who wanted to make him a priest, but the lad at fifteen enlisted in a battalion of students to fight against the armies of Napoleon I. In 1811 Espartero was appointed a lieutenant of Engineers in Cadiz, but having failed to pass his examination he entered a line regiment. In 1813 he went to America as a captain under General Morillo, who had been made commander-in-chief to
Generals Concha and Diego de Leon. The latter was shot in Madrid. Espartaro crushed with much energy a revolutionary rising in Barcelona, but on his return to Madrid was so coldly welcomed that he perceived that his prestige was on the wane. The advanced Progressists coalesced with the partisans of the ex-regent Christina to promote pronunciamientos in Barcelona and other places, and the rebels declared martial law in several cities led by General Narvaez, marched upon Madrid. Espartaro, deeming resistance useless, embarked at Cadiz on the 30th of July 1835, for England, and lived quietly apart from politics until 1848, when a royal decree restored to him all his honours and his seat in the senate. He retired to his house in Logroño, which he left six years later, in 1854, when called upon by the queen to take the lead of the powerful Liberal and Progressivist movement which prevailed for two years. The old marshal vainly endeavoured to keep his own Progressists within bounds in the Cortes of 1854-1856, and in the great towns, but their excessive demands for reforms and liberties played into the hands of a clerical and reactionary court and of the equally retrograde governing classes. The growing ambition of General O'Donnell constantly clashed with the views of Espartaro, until the latter, in sheer disgust, resigned his premiership and left for Logroño, after warning the queen about the texture fabrics in the Antonino, and the Cortes, backed by the Progressivist militia. O'Donnell's pronunciamiento in 1856 put an end to the Cortes, and the militia was disarmed, after a sharp struggle in the streets of the capital. After 1856 Espartaro resolutely declined to identify himself with active politics, though at every stage in the onward march of Spain towards more liberal and democratic institutions he was asked to take a leading part. He refused to allow his name to be brought forward as a candidate when the Cortes of 1868, after the Revolution, sought for a ruler. Espartaro, strangely enough, adopted a laconic phrase when successive governments on their advent to power invariably addressed themselves to the venerable champion of liberal ideas. To all—to the Revolution of 1868, the Constituent Cortes of 1869, King Amadeus, the Federal Republic of 1873, the nameless government of Marshal Serrano in 1874, the Bourbon restoration in 1875—he simply said: "Cumple la voluntad nacional" ("Let the national will be accomplished"). King Amadeus made him prince of Vergara. The Restoration raised a statue to him near the gate of the Retiro Park in Madrid. Spanish of all shades, except Carlists and Ultramontanes, paid homage to his memory when he passed away at his Logroño residence on the 8th of January 1879. His tastes were singularly modest, his manners rather reserved, but always kind and considerate for humble folk. He was a typical Spanish soldier-politician, though he had more of the better traits of the soldier than of the arts of the peacetime politician. His military instincts did not always make it easy for him to accommodate himself to courtiers and professional politicians. (A. E. H.)

Esparto, or Spanish Grass, Stipa tenacissima, a grass resembling the ornamental feather-grass of gardens. It is indigenous to the south of Spain and the north of Africa (where it is known as Halfa or Alfa), and is especially abundant in the sterile and rugged parts of Murcia and Valencia, and in Algeria, flourishing best in sandy, ferruginous soils, in deep, sunny situations on the sea coast. Pliny (N.H. xii. 2) described what appears to have been the same plant under the name of sparium, whence the designation campus sparius for the region surrounding New Carthage. It attains a height of 3 or 4 ft. The stems are cylindrical, and clothed with short hair, and grow in clusters of from 2 to 10 ft. in circumference; when young they serve as food for cattle, but after a few years' growth acquire great toughness of texture. The leaves vary from 0.5 in. to 3 ft. in length, and are grooved in a groove of their own, and amount to the same kind of fibre and flexibility they have for centuries been employed for the making of ropes, sandals, baskets, mats and other articles. Ships' cables of esparto, being light, have the quality of floating on water, and have long been in use in the Spanish navy.

Esparto leaves contain 56% by weight of fibre, or about 10% more than straw, and hence have come into requisition as a substitute for linen rags in the manufacture of paper. For this purpose they were first utilized by the French, and in 1857 were introduced into Great Britain. When required for paper-making the leaves should be gathered before they are quite matured; if, however, they are obtained too young, they furnish a paper having an objectionable semi-transparent appearance, and from 2 to 3 cwt. may be collected in a day by a single labourer. They are generally obtained during the dry summer months, as at other times their adherence to the stems is so firm as often to cause the uprooting of the plants in the attempt to remove them. Esparto may be raised from seed, but cannot be harvested for twelve or fifteen years after sowing.

Another grass, Lygeum Sparrs, with stiff rush-like leaves, growing in rocky soil on the high plains of countries bordering on the Mediterranean, especially of Spain and Algeria, is also a source of esparto. For the processes of the paper manufacturer esparto is used in the dry state, and without cutting; roots and flowers and straw weeds are first removed, and the material is then boiled with caustic soda, washed, and bleached with chlorine solution. Sundry experiments have been made to adapt esparto for use in the production of paper. Messrs. Adam and Bartlett, who in 1876 directed attention to the composition of the slag resulting from the burning of esparto, which they found to be strikingly similar to that of average medical bottle glass, the latter yielding on analysis 66.5% of silica and 25.1% of alkali and alkaline earths, and the slag 64.6 and 27.45% of the same respectively.

Eesperance, a small seaport on a fine natural harbour on the south coast of West Australia, 275 m. north-east from Albany. It is a summer resort, and in the neighbourhood are interesting caves. Its importance as a seaport is due to its being on the high road between the eastern states and the gold-fields, and the nearest place for the shipment of gold from the Coolgardie fields.

Eesperanto, an artificial international auxiliary language (see Universal Languages), first published in 1887, seven years after the appearance of its predecessor Volapük (q.v.), which has now completely supplanted its. Its author was a Russian physician, Dr. L. Zamenhof, born in 1859 at Bielestok, where the spectacle of the feuds of the four races—each speaking different languages—which inhabit it (Russians, Poles, Germans and Jews) at an early date suggested to him the idea of remedying the evil by the introduction of a neutral language, standing apart from the existing national languages. His first idea was to resuscitate some dead language. Then he tried to construct a new language on an a priori basis. At the same time he made what he appears to have considered the great discovery that the bulk of the vocabulary of a language consists not of independent roots, but of sounds and derivatives formed from a comparatively small number of roots.

At first he tried to construct his roots a priori by arbitrary combinations of letters. Then he fell back on the plan of taking his roots ready-made from existing languages, as the inventor of Volapük had done before him. But instead of taking them mainly from one language, he has selected them from the chief European languages, but not impartially. Like all inventors of artificial languages, he is more ready to experiment with foreign languages than with his own; and hence the Slavonic roots in Esperanto are much less numerous than those taken from the other European languages. Here his choice has been to some extent guided by considerations of internationality, although he has not fully grasped the importance of the principle of maximum internationality, so well worked out in the latest rival of Esperanto—Idiom Neutral (see Universal Languages). Thus he adopts a large number of international words—go, run, open, hold, climb, etc., each of them adapted to Esperanto by his own method, e.g. the word for 'fly' is trasloki, from English 'to fly', but 'fly' from Latin (latem) and French (voleur), on the one hand, and the Germanic on the other hand, the latter being taken sometimes
from German (surs, "only"), sometimes from English, the words being generally written more or less phonetically (rajt = right).
Most of the German words are badly chosen from the international point of view. Thus the German word quoted above would not be intelligible to any one ignorant of German. Indeed, from the international point of view all specially German words ought to be excluded, or else reduced to the common Germanic form; thus drunk ought to be made into drink, the t being a specially German modification of the d, preserved not only in English but in all the remaining Germanic languages. This incongruous mixture of languages is not only jarring and repulsive, but adds greatly to the difficulty of mastering the vocabulary for the polyglot as well as for the monolingual learner.
The invention has taken great pains to reduce the number of his roots to a minimum; there are 26,429 of them in his dictionary, the Universa Vortaro (from Ger. Wort, "word"), which does not include such international words as poesio, telefono; these the learner is supposed to recognize and form without help. The most eccentric feature of the vocabulary, and the one to which it owes much of its brevity, is the extensive use of the prefix mal- to reverse the meaning of a word, as in malamiko, "embezzlement," heilama, "heal," etc.

The phonology of the language is very simple. The vowels are only five in number, a, e, i, o, u, used without any distinction of quantity, as in Russian. There are six diphthongs, expressed by an unnecessarily complicated notation. The consonant-system is simple enough in itself, but is greatly complicated in writing by the excessive and mostly unnecessary use made of diacritical letters not only for simple sounds but also for consonant-groups. a is used for or, as in Polish.

The grammar is, like that of Volapük, partly borrowed from existing languages, partly a priori and arbitrary. The use of the final vowels belongs to the latter category. The use of a to indicate adjectives and of -o to indicate nouns as in kara amiko, "dear (male) friend," is a source of confusion to those familiar with the Romance languages, and has proved a bar to the diffusion of Esperanto among the speakers of these languages. On the other hand, the following paradigm will show how faithfully Esperanto can reproduce the defects of conventional European grammar:

<table>
<thead>
<tr>
<th>Singular</th>
<th>Plural</th>
</tr>
</thead>
<tbody>
<tr>
<td>Nominative</td>
<td>la bona pairo</td>
</tr>
<tr>
<td>Accusative</td>
<td>la bonon pairo</td>
</tr>
</tbody>
</table>

It is difficult to see why the accusative should be kept when all the other cases are replaced by prepositions.

The verb is better than the noun. Its inflections are as present, -is preterite, -as future, -as conditional, -a imperative and subjunctive, -i infinitive, together with the following participles:

<table>
<thead>
<tr>
<th>Active</th>
<th>Passive</th>
</tr>
</thead>
<tbody>
<tr>
<td>Present</td>
<td>-anta</td>
</tr>
<tr>
<td>Preterite</td>
<td>-inta</td>
</tr>
<tr>
<td>Future</td>
<td>-anta</td>
</tr>
</tbody>
</table>

The inventor has followed the good example of his native language in using esti, "to be," as the auxiliary verb both in the passive, where it is combined with passive participles, and in the secondary tenses of the active (perfect, pluperfect, etc.), where it is combined with the active participles. The participles can be made into nouns and adverbs by changing the final -a into -o and -e respectively: thus tenento, "the future holder," perdinte, "through having lost."

The table of the forty-five correlative pronouns, adjectives and adverbs is also elaborate and ingenious.

Much ingenuity is displayed in the syntax, as well as in some happy simplifications. But, on the other hand, there is much that is even more arbitrary and opaque, as in the use of the definite article—where the author has unfortunately followed French rather than English usage—and in the moods of the verb.

The following specimens will show the general character of this easy-flowing but somewhat heavy and monotonous language—"bad Italian," as it is called by its detractors:

Patro nia, kiu estas en la fielo, sanka estu via nomo; venu regeco via; estu vola via, kiel en la fielo, tiel ankaŭ sur la teto.

Panon nian fiugagen donu al ni hodiaŭ; kaj pardo unu al ni fuldoja, kiel ni ankau gastalanto; kaj ne konduka ni en tenton, sed libera ni de la malbono.

Estimata Sinjoro. Per tiu ĉi libreto mi havas la honon prezenteti al vi la lingvon internacian Esperanto. Esperanto tute ne havas la polonan kaj la francojn manketi; mem jiaj devas nur servi por la rilatoj internaciaj kaj por tiuj verkoj aŭ produktoj, kiuj interesas egale la tutan mondon.

In summing up the merits and defects of Esperanto we must begin by admitting that it is the most reasonable and practical artificial language that has yet appeared. Its inventor has had the double advantage of being able to profit by the mistakes of his predecessors, and of being himself, by force of circumstances, a better linguist. It must further be admitted that he has made an effort to use these advantages to the best of his ability, and that systematic training in scientific philology in its widest sense.

This last defect explains why the enthusiasm which his work has excited in the great world of linguistic dilettantes has not been shared by the philologists: in spite of its superiority to Volapük, they see in it the same radical defects. Whether they are rash or not in predicting for it a similar fate, remains to be seen.

The Esperantists, warned by the fate of Volapük, have adopted the wise policy of suppressing all internal dissension by submitting to the dictatorship of the inventor, and so presenting a united front to the enemy. One thing is clear: either Esperanto must be taken as it is without change, or else it must crumble to pieces; its failure to work out consistently the principle of the maximum of internationality for its root-words is alone enough to condemn it as hopelessly antiquated even from the narrow point of view which regards it "international" as synonymous with "European." It is a view which political development in the Far East has made equally obsolete.

ESPINAY, TIMOLÉON D' (1580–1644), French soldier, was the eldest of the four sons of François d'Espina, seigneur de Saint Luc (1554–1597), and was himself marquis de Saint Luc. In 1603 he accompanied Sully in his embassy to London. In 1621, in his capacity as vice-admiral of France, he gained some advantages over the defenders of La Rochelle, obliging the Huguenot commander, Benjamin de Rohan, seigneur de Soubise, to evacuate the islands of Ré and Oléron. In 1627 he was named lieutenant-general of Guienne and marshal of France.

ESPINEL, VICENTE MARTINEZ (1551–1624), Spanish poet and novelist, was baptized on the 28th of December 1551, and educated at Salamanca. He was expelled from the university in 1578, and served as a soldier in Flanders, returning to Spain in 1584. He took orders in 1589, and four years later became chaplain at Ronda, absenting himself from his living, and was deprived of his cure; but his musical skill obtained for him the post of choirmaster at Plasencia. His Diversas Rimas (1591) are undeniably good examples of technical accomplishment and caustic wit. Espinel, however, survives as the author of a clever picarolesque novel entitled Relaciones de la vida del Escudero Marcos de Obrégón (1618). It is, in many passages, an autobiographie of Espinel with picturesque embellishments. Marcos is not a chivalresque "esquire," but an adventurer who seeks his fortune by attaching himself to great men; and the object of the author is to warn young men against such a life. Apart from the unedifying confessions of the hero, the book contains curious anecdotes concerning prominent contemporaries, and the episodical stories are told with great spirit; the style is extremely correct, though somewhat diffuse. Le Sage has not scrupled to borrow from Marcos de Obrégón many of the incidents and characters in Gil Blas—a circumstance which induced Isla to give to his Spanish translation of Le Sage's work the jesting title, Gil Blas restored to his Country and his Native Tongue. In the 1775 edition of the Stichle de Louis XIV, Voltaire grossly exaggerates in saying that Gil Blas is taken entirely from Marcos de Obrégón. Espinel was a clever musician and added a fifth string to the guitar. He revived the measure known as décimas or espinelas, consisting of a stanza of ten octasyllabic lines. Most of the poems which he left in manuscript remain unpublished owing to their licentious character.
ESPIRITO SANTO—ESQUIRE

BIBLIOGRAPHY.—J. Pere de Guzmán's edition of Marcos de Obregón (Barcelona, 1881) includes a valuable introduction, Léon Claretie, Le Sage romantique (Paris, 1890), discusses exhaustively the question of Le Sage's indebtedness to Esquial. For some pictures of the coastal plains of Minas Geraes see Salvy and Mallet, Catálogo de la biblioteca de Salvi (Valencia, 1872).

ESPIRITO SANTO, a maritime state of Brazil, bounded N. by Bahia, E. by the Atlantic Ocean, S. by Rio de Janeiro, and W. by Minas Geraes. Pop. (1890) 135,997; (1910) 209,783; area, 17,416 sq. m. With the exception of Sergipe it is the smallest of the Brazilian states. The western border of the state is formed by low ranges of mountains forming a northern continuation of the Serra do Mar. The longest and most prominent of these ranges, which are for the most part the eastern escarpments of the great Brazilian plateau, is the Serra dos Aymores, which extends along fully two-thirds of the western frontier. Further S. the ranges are much broken and extend partly across the state toward the seaboard; the more prominent are known as the Serra do Espigão, Serra da Chibata, Serra dos Pilões and Serra dos Fudos. The eastern and larger part of the state belongs to the coastal plain, in great part low and swampy, with large areas of sand bars and broken by isolated groups and ranges of hills. With the exception of the sandy plains the country is heavily forested, even the mountain sides being covered with vegetation to their summits. The northern and southern parts are fertile, but the central districts are comparatively poor. The coastal plain comprises a sandy, unproductive belt immediately on the coast, back of which is a marshy plain which extends, nearly the length of the country, to the production of sugar and cotton. The inland valleys and slopes are very fertile and heavily forested, and much of the Brazilian export of rosewood and other cabinet woods is drawn from this state. There is only one good bay on the coast, that of Espirito Santo, on which the port of Victoria is situated. The river-mouths are obstructed by sand bars and admit small vessels only. The principal rivers of the state are the Mucury, which begins in Minas Geraes and forms the boundary line with Bahia, the Itanuas, São Domingos, São Mathias, Doce, Timbúhy, Santa Maria, Jucú, Benevente, Itapemirim, and Itabapoana, the last forming the boundary line with Rio de Janeiro. The Doce, São Matheus, and Itapemirim rise in Minas Geraes and flow entirely across the state. The lower courses of these rivers are generally navigable, that of the Rio Doce for a distance of 90 m. The climate of the coastal zone and deeper valleys is hot, humid and unhealthy, malarial fevers being prevalent. In the higher country the temperature is lower and the climate is healthy. Espirito Santo is almost exclusively agricultural, sugar-cane, coffee, rice, cotton, tobacco, mandioca and tropical fruits being the principal products. Agriculture is in a very backward condition, however, and the state is classed as one of the poorest and most unproductive in the republic. The rivers and shallow coast waters are well stocked with fish, but there are no fishes industries worthy of mention. There are three railway lines in operation in the state—one running from Victoria to Cachoeira do Itapemirim (50 m.), and thence, by another line, to Santo Eduardo In Rio de Janeiro (58 m.), where connexion is made with the Leopoldina system running into the national capital, and a third running north-westtherly from Victoria to Diamantina, Minas Geraes, about 450 m. The chief cities and towns of the state, with their populations in 1890, are Victoria, São Matheus (municipality, 7701) on a river of the same name 16 m. from the sea, Serra (municipality, 6974), Guarapary (municipality, 6510), a small port S. by W. of the capital, Conceição da Barra (municipality, 5628), the port of São Matheus and Cachoeira do Itapemirim (2420), an important commercial centre in the south.

Espirito Santo formed part of one of the original captaincies which were given to Vasco Fernandes Coutinho by the Portuguese crown. The first settlement (1335) was at the entrance to the bay of Espirito Santo, and its name was afterwards given to the bay itself. The present municipality of Campos de Jataí, belonging to the state of Rio de Janeiro, is formed by the islands of Trinidad and Martim Vaz, which lie about 7 15 m. E. of Victoria, belong politically to this state. They are uninhabited, but considerable importance is attached to the ferry because Great Britain has twice attempted to take possession of it. It rises 1200 ft. and is seen from land at about 6 m. in circumference, but it has no value other than that of an ocean cable station. An excellent description of this singular island is to be found in E. F. Knight's Cruise of the 'Alerte' (London, 1895).

ESPRONCEDA, JOSÉ IGNACIO JAVIER ORIOL ENCARNACIÓN DB (1806–1844), Spanish poet, son of an officer in the Bourbon regiment, was born at or near Almedralalo de los Reys, on the 9th of March, 1806. In 1820 he was sent to the preparatory school of artillery at Segovia, and later became a pupil of the poet Lista, then professor of literature at St Matthew's College in Madrid. In his fourteenth year he had attracted his master's attention by his verses, and had joined a secret society. Sentenced to five years' seclusion in the Franciscan convent at Guadalajara, he began an epic poem entitled Poeta, of which fragments survive. He escaped to Portugal and thence to England, where he found the famous Teresa whom he had met at Lisbon; here, too, he became a student of Shakespeare, Milton and Byron. In 1830 he eloped with Teresa to Paris, took part in the July revolution, and soon after joined the raid of Chapalangarra on Navarre. In 1833 he returned to Spain and obtained a commission in the queen's guards. This, however, he soon forfeited by a political song, and he was banished to Cuéllar, where he wrote a poor novel entitled Sancho Saldana o el Castellano de Cuéllar (1837). He took an active part in the revolutionary risings of 1835 and 1836, and, on the accession to power of the Liberal party in 1840, was appointed secretary of legation at the Hague; in 1842 he was elected deputy for Almería, and seemed likely to play a great part in parliamentary life. But his constitution was undermined, and, after a short illness, he died at Madrid on the 23rd of May 1842. His poems, first published in 1840, at once gained for him a reputation which still continues undiminished. The influence of Byron pervades Espronceda's life and work. It is present in an ambitious variant on the Don Juan legend, El Estudiante de Salamanca, Elvira's letter being obviously modelled on Julia's letter in Don Juan; la Canción de los Piratas is suggested by The Corsair; and the Byronic inspiration is not wanting even in the noble fragment entitled El Diablo Mundo, based on the story of Faust. But in El Mendigo, in El Rio de Muerte, in El Verdugo, and in the same vehement lines, A Joven es una orla, Espronceda approves himself the most potent and original lyrical poet produced by Spain during the 19th century.

BIBLIOGRAPHY.—Obras poéticas y escritos en prosa (Madrid, 1884), edited by Blanca Espronceda de Escosura, the poet's daughter (a second volume has since been published); and Manuel de la Sota, El Espronceda; su tiempo, su vida, y sus obras (Madrid, 1883); E. Piñeyro, El Romanticismo en España (Paris, 1904).

ESQUIRE (O. Fr. escuyer, Mod. Fr. écuyer, derived through the form escuyer from Med. Lat. scutarius, "shield-bearer"), originally the attendant on a knight, whose helm, shield and lance he carried at the tournament or in the field of battle. The esquire ranked immediately below the knight bachelor, and his office was regarded as the apprentice stage of knighthood. The title was regarded as one of function, not of birth, and was not hereditary. In time, however, its original significance was lost sight of, and it came to be a title of honour, implying a rank between that of knight and valet or gentleman, as it technically still remains. Thus in the later middle ages esquire (armiger) was the customary description of holders of knight's fees who had not taken up their knighthood, whence the surviving custom of entitled the principal landowner in a parish "the squire" (see Squire). Camden, at the close of the 16th century, distinguished four classes entitled to bear the style: (1) The eldest sons of knights, and their eldest sons, in perpetual succession; (2) the eldest sons of the younger sons of peers, and their eldest sons, in like perpetual succession; (3) esquires created by letters patent or by other investiture; (4) esquires by office, e.g. justices of the peace and others who
bear any office of trust under the crown. To these the writer in the 3rd edition of the Encyclopedia Britannica (1797) added Irish peers and the eldest sons of British peers, who, though they bear courtesy titles, have in law only the right to be styled esquires. Officers of the king's courts, and of the royal household, counsellors at law and justices of the peace he described as esquires only "by reputation"; and justices of the peace have the title only as long as they are in commission; while certain heads of great landed families are styled "esquires" by prescription. But, the meaner ranks of people, he adds indignantly, "who know no better, do often basely prostitute this title; and, to the great confusion of all rank and precedence, every man who makes a decent appearance, far from thinking himself in any way ridiculed by finding the superscription of his letters thus decorated, is fully gratified by such an address."

It is clear, however, that the title of esquire was very loosely used at a much earlier date. On this point Selden is somewhat scornfully explicit. "To whomsoever, either by blood, place in the State or other eminency, we conceive some higher attribute should be given, than that sole Title of Gentleman, knowing yet that he hath no other honoratory title legally fixed upon him, we usually style him an Esquire, in such passages as require legally that his degree or state be mentioned; as especially in Indictments and Actions whereupon he may be outlawed. Those of other nations who are Barons or great Lords in their own Country, of our name, and so styled, are in legal usage, no better than us, Esquires only. Some of our greatest Heralds have their divisions of Esquires applied to this day. I leave them as I see them, where they may easily be found." Coke, too, says that every one is entitled to be termed esquire who has the legal right to call himself a gentleman (2. Institutes, 688).

At the present time the following classes are recognized as esquires on occasions of ceremony or for legal purposes:—(1) All sons of peers and lords of parliament dying their father's deaths and the younger sons of such peers, &c., after their fathers' deaths; the eldest sons of peers' younger sons, and their eldest sons for ever. (2) Noblemen of all other nations. (3) The eldest sons of baronets and knights. (4) Persons bearing arms and the title of esquire by letters patent. (5) Esquires of the Bath and their eldest sons. (6) Barristers-at-law. (7) Justices of the peace and mayors while in commission or office. (8) The holders of any superior office under the crown. (9) Persons styled esquires by the sovereign in their patents, commissions or appointments. (10) Attorneys in colonies where the functions of counsel and attorney are united (in England solicitors are "gentlemen," not "esquires").

In practice, however, the title of esquire, now to all intents and purposes meaningless, is given to any one who "can bear the port, charge and countenance of a gentleman." The word has followed the same course as that of "gentleman" (q.v.), and for very similar reasons. It is still not customary in Great Britain to address e.g. a well-to-do person engaged in trade as esquire at his shop; it would be offensive not to do so at his private residence. In America, on the other hand, the use of the word "esquire" is practically obsolete, "Mr" ("Mister" or "Master," at one time the title special to a "gentleman") being the general form of address.

ESQUIROL, JEAN ÉTIENNE DOMINIQUE (1772-1840), French alienist, was born at Toulouse on the 3rd of February 1772. In 1794 he became a pupil of the military hospital of Narbonne, and subsequently studied in Paris at the Salpêtrière under P. Pinel, whose assistant he became. In 1811 he was chosen physician to the Salpêtrière, and in 1817 he began a course of lectures on the treatment of the insane, in which he made such revelations of the abuses existing in the asylums that the government appointed a commission to inquire into the subject. Esquirol in this and other ways greatly assisted Pinel's efforts for the introduction of humane methods. The asylum of Rouen, Nantes and Montpellier were built in accordance with his plans. In 1823 he became inspector-general of the university of Paris for the faculties of medicine, and in 1826 chief physician of the asylum at Charenton. He died at Paris on the 13th of December 1840. Besides contributing to the Dictionnaire des sciences médicales and the Encyclopédie des gens du monde, Esquirol wrote Des maladies mentales, considérées sous les rapports médical, hygiénique, et médico-légal (2 vols., Paris, 1838).

ESQUIROS, HENRI FRANÇOIS ALPHONSE (1812-1876), French writer, was born in Paris on the 23rd of May 1812. After some minor publications he produced L'Évangile du peuple (1840), an exposition of the life and character of Jesus as a social reformer. This work was considered an offence against religion and decency, and Esquiros was fined and imprisoned. He was elected in 1830 as a social democrat to the Legislative Assembly, but was exiled in 1831 for his opposition to the Empire. Returning to France in 1869 he was again a member of the Legislative Assembly, and in 1876 was elected to the Senate. He died at Versailles on the 12th of May 1876. He turned to account his residence in England in L'Angleterre et la vie anglaise (5 vols., 1859-1866). Among his numerous works on social subjects may be noted:—Histoire des Montagnards (2 vols., Paris, 1864); La vie des gens de lettres du XIXe siècle (2 vols., 1847); and Histoire des martyrs de la liberté (1851).

ESS, JOHANN HEINRICH VAN (1772-1847), German Catholic theologian, was born at Warburg, Westphalia, on the 15th of February 1772. He was educated at the Dominican gymnasium of his native town, and in 1790 entered, as a novice, the Bene dictine abbey of Marienmünster, in the bishopric of Paderborn. His Benedictine name was Leander. He was priest at Schwenge berg from 1799 to 1812, after which he became extraordinary professor of theology and joint-director of the teachers' seminary at Marburg. In 1818 he received the doctorate of theology and of canonical law. In 1807, in conjunction with his cousin Karl van Ess, he had published a German translation of the New Testament, and, as its circulation was disowned by his superiors, he published in 1808 a defence of his views, entitled Auszüge aus den heiligen Vätern und anderen Lehrern der katholischen Kirche über das notwendige und nützliche Bibel lesen. An improved edition of this tractate was published in 1816, under the title Gedanken über Bibel und Bibelaussagen, and in the same year appeared Was war die Bibel den ersten Christen? In 1822 he published the first part of a German translation of the Old Testament, which was completed in 1836. In 1822 he resigned his offices at Marburg in order to devote his whole time to the defence of his views regarding Bible reading by the people; and, in order to endeavour to promote the circulation of the scriptures, he was associated first with the Catholic Bible Society of Regensburg, and then with the British and Foreign Bible Society. He died at Afforderbach in the Odenwald on the 13th of October 1847.

ESSAY, ESSAYIST (Fr. essai, Late Lat. exarium, a weighing or balance; essegere, to examine; the term in general meaning any trial or effort). As a form of literature, the essay is a composition of moderate length, usually in prose, which deals as an essay, cursory way with the external conditions of a subject, and, in strictness, with that subject only as it affects the writer. Dr Johnson, himself an eminent essayist, defines an essay as "an irregular, undigested piece"; the irregularity may perhaps be admitted, but want of thought, that is to say lack of proper mental digestion, is certainly not characteristic of a fine example. It should, on the contrary, always be the brief and light result of experience and profound meditation, while the "undigested" is the last epitaph to be applied to the essays of Montaigne, Addison or Lamb. Bacon said that the Epistles of Seneca were "essays," but this can hardly be allowed. Bacon himself goes on to admit that "the word is late, though the thing is ancient." The word, in fact, was invented for this species of writing by Montaigne, who merely meant that these were experiments in
a new kind of literature. This original meaning, namely that these pieces were attempts or endeavours, feeling their way towards the expression of what would need a far wider space to exhaust, was lost in England in the course of the eighteenth century. This is seen by the various attempts made in the nineteenth century to coin a word which should express a still smaller work, as distinctive in comparison with the essay as the essay is by the side of the monograph; none of these linguistic experiments, such as essuyette, essuyisme (Thackeray) and essuyel (Helps) have taken hold of the language. As a matter of fact, the journalistic word article covers the lesser form of essay, although not exhaustively, since the essay in the popular sense, the quarterly reviews, which are fully as extended as an essay should ever be, are frequently termed "articles," while many "articles" in newspapers, dictionaries and encyclopaedias are in no sense essays. It may be said that the idea of a detached work is combined with the word "essay," which should be neither a section of a disquisition nor a chapter in a book which aims at the systematic development of a story. Locke's Essay on the Human Understanding is not an essay at all, or cluster of essays, in this technical sense, but refers to the experimental and tentative nature of the inquiry which the philosopher was undertaking. Of the curious use of the word so repeatedly made by Pope mention will be made below.

The essay, as a species of literature, was invented by Montaigne, who had probably little suspicion of the far-reaching importance of what he had created. In his dejected moments, he turned to read what he had written, and "divested" and "sottises." But in his own heart he must have been well satisfied with the new and beautiful form which he had added to literary tradition. He was perfectly aware that he had devised a new thing; that he had invented a way of communicating himself to the world as a type of human nature. He designed it to carry out his peculiar object, which was to produce an accurate portrait of his own soul, not as it was yesterday or will be to-morrow, but as it is to-day. It is not often that we can date with any approach to accuracy the arrival of a new class of literature into the world, but it was in the month of March 1571 that the essay was invented. It was started in the second story of the old tower of the castle of Montaigne, in a study to which the philosopher withdrew for that purpose, surrounded by his books, close to his chapel, sheltered from the excresces of a fatiguing world. He wrote slowly, not systematically; it took him seven years to finish the first two books of the essays. In 1574 the manuscript of the whole work was finished, and was immediately, and was not returned to the author for four months. The earliest imprint saw the light in 1580, at Bordeaux, and the Paris edition of 1588, which is the fifth, contains the final text of the great author. These dates are not negligible in the briefest history of the essay, for they are those of its revelation to the world of readers. It was in the delightful chapters of his new, strange book that Montaigne introduced the fashion of writing briefly, irregularly, with constant digressions and interruptions, about the world as it appears to the individual who writes. The Essais were instantly welcomed, and few writers of the Renaissance had so instant and so vast a popularity as Montaigne. But whilst the philosophy, and above all the graceful stoicism, of the great master were admired and copied in France, the exact shape in which he had put down his thoughts, in the exquisite negligence of a series of essays, was too delicate to tempt an imitator. It is to be noted that neither Charron, nor Mille de Gournay, his most immediate disciples, tried to write essays. But Montaigne, who liked to fancy that the essay author he was of English extraction, had spoken affably of the English people as his "cousins," and it has always been admitted that his genius has an affinity with the English. He was early read in England, and certainly by Bacon, whose is the second great name connected with this form of literature. When Addison in freshening his memory, in the death of Montaigne, that Bacon published in a small octavo the first ten of his essays. These he increased to 58 in 1623 and to 58 in 1625. In their first form, the essays of Bacon had nothing of the fulness or grace of Montaigne's; they are meagre notes, scarcely more than the headings, for which Foucquet it is possible that when he wrote them he was not yet familiar with the style of his predecessor, which was first made popular in England, in 1603, when Florio published that translation of the Essais which Shakespeare unquestionably read. In the later editions Bacon greatly expanded his theme, but he never reached, or but seldom, the freedom and ease, the seeming formlessness held in by an invisible chain, which are the glory of Montaigne, and distinguish the typical essayist. It would seem as if it was at first, in English as in French, no loss of the essay was willing to adopt a title which belonged to so great a presence as that of Bacon or Montaigne. The one exception was Sir William Cornwallis (d. 1631), who published essays in 1600 and 1617, of slight merit, but popular in their day. No other English essayist of any importance appeared until the Restoration, when Abraham Cowley wrote eleven "Several Discourses by way of Essays," which did not see the light until 1668. He interspersed with his prose, translations and original pieces in verse, but in other respects Cowley keeps much nearer than Bacon to the form of Montaigne. Cowley's essay "Of Myself" is a model of what these little compositions should be. The name of Bacon inspires awe, but it is really not he, but Cowley, who is the father of the English essay; and it is Remarkable that he has had no warmer panegyrists than his great successors, Charles Lamb and Macaulay. Towards the end of the century, Sir George Ewer (1629) wrote a little essay on the "Culmination," which, however, essays rather in name than form. Whenever, however, we reach the eighteenth century, we find the essay suddenly became a dominant force in English literature. It made its appearance almost as a new thing, and in combination with the earliest developments of journalism. On the 12th of April 1700 appeared the first number of a penny newspaper, entitled the Tatler, a main feature of which was to amuse and instruct fashionable readers by a series of short papers dealing with the manifold occurrences of life, quaeque agendi bonum. But it was not until Steele, the founder of the Tatler, was joined by Addison that the eighteenth-century essay really started upon its course. It displayed at first, and indeed it long retained, a mixture of the manner of Montaigne with that of La Bruyère, combining the form of the pure essay with that of the character-study, as modelled on Theophrastus, which had been so popular in England throughout the seventeenth century. Addison's "Tatler" portraits, in particular, such as "Sir Charles Bannister," and "Ned Softly," are hardly essays. But Steele's "Recollections of Childhood" is, and here we may observe the type on which Goldsmith, Lamb and R. L. Stevenson afterwards worked. In January 1711 the Tatler came to an end, and was almost immediately followed by the Spectator, and in 1713 by the Guardian. These three newspapers are storeroomes of admirable and typical essays, the majority of them written by Steele and Addison, who are the most celebrated eighteenth-century essayists in England. Later in the century, after the publication of other less successful experiments, appeared Fielding's essays in the Covent Garden Journal (1752) and Johnson's in the Rambler (1750), the Adventurer (1752) and the Idler (1759). There followed a great number of polite journals, in which the essay was treated as "the bow of Ulysses in which it was the fashion for men of rank and genius to try their strength." Goldsmith reached a higher level than the Chesterfields and Bonnel Thornton had dreamed of, in the delicious sections of his Citizen of the World (1760). After Goldsmith, the eighteenth-century essay declined into tamer hands, and passed into final feebleness with the pedantic Richard Cumberland and the sentimental Henry Mackenzie. The corpus of eighteenth-century essayists is extremely voluminous, and their reprinted works fill some fifty volumes. There is, however, a great sameness about all but the very best of them, and in no case do they carry on the form he adopted for his lucubrations. What has survived of them all is the lightest portion, but it should not be forgotten.
that a very large section of the essays of that age were deliberately didactic and "moral." A great revival of the essay took place during the first quarter of the nineteenth century, and foremost in the history of this movement must always be placed the name of Charles Lamb. He perceived that the real business of the essay, as Montaigne had conceived it, was to be largely personal. The famous Essays of Elia began to appear in the London Magazine for August 1820, and proceeded at fairly regular intervals until December 1822; early in 1823 the first series ended, and he approached far more closely, in a new chapter. The personality of Lamb's style as an essayist was that he threw off the Addisonian and still more the Johnsonian tradition, which had become a burden that crushed the life out of each conventional essay, and that he boldly went back to the rich verbiage and brilliant imagery of the seventeenth century for his inspiration. It is true that Lamb had great ductility of style, and that, when he pleases, he can write so like Steele that Steele himself might scarcely know the difference, yet in his freer flights we are conscious of more exalted masters, of Milton, Thomas Browne and Jeremy Taylor. He succeeded, moreover, in reaching a poignant note of personal feeling, such as none of his predecessors had ever aimed at; the essays called "Dream Children" and "Blakesmoor" are examples of this, and they display a degree of harmony and perfection in the writing of the pure essay such as had never been attempted before, and has never since been reached. Leigh Hunt, clearing away all the didactic and patriotic waffle which had in several of the essays grown to its old Spectator grace, and was the most easy nondescript writer of his generation in periodicals such as the Indocator (1819) and the Companion (1828). The sermons, letters and pamphlets of Sydney Smith were really essays of an extended order. In Hazlitt and Francis Jeffrey we see the form and method of the essay beginning to be applied to literary criticism. The writings of De Quincey are almost exclusively essays, and are among the most notable of them, unlike the great Spectator or the Indocator. Leigh Hunt's essays and pamphlets have far outgrown the limits of the length laid down by the most indulgent formalist. His biographical and critical essays are interesting, but they are far from being trustworthy models in form or substance. In a sketch, however rapid, of the essay in the nineteenth century, prominence must be given to the name of Macaulay. His earliest essay, that on Milton, appeared in the Edinburgh Review in 1845, very shortly after the revelation of Lamb's genius in "Elia." No two products cast in the same mould could, however, be more unlike in substance. In the hands of Macaulay the essay ceases to be a confession or an autobiography; it is strictly impersonal, it is literary, historical or controversial, vigorous, trenchant and full of party prejudice. The periodical publication of Macaulay's Essays in the Edinburgh Review went on until 1844; when we cast our eyes over this mass of brilliant writing we observe with surprise that it is almost wholly contentious. Nothing can be more remarkable than the difference in this respect between Lamb and Macaulay, the former for ever demanding, even cajoling, the sympathy of the reader, the latter scanning the horizon for an enemy to controvert. In later times the essay in England has been cultivated in each of these ways, by a thousand journalists and authors. The "leaders" of a daily newspaper are examples of the popularization of the essay, and they point to the danger which now attacks it, that of producing a purely ephemeral or even momentary species of effect. The essay, in its best days, was intended to be as lasting as a poem or a historical monograph; it aimed at being one of the most durable and precious departments of literature. We still occasionally see the production of essays which have this more ambitious aim; within the last quarter of the nineteenth century the essays of R. L. Stevenson achieved it. His Familiar Studies are of the same class as those of Montaigne and Lamb, and his essayist appearance is far more closely the reproduction of a writer other than contemporary to their high level of excellence. We have seen that the tone of the essay should be personal and confidential; in Stevenson's case it was characteristically so. But the voices which please the public in a strain of pure self-study are few at all times, and with the cultivation of the analytic habit they tend to become less original and attractive. It is possible that the essay may die of exhaustion of interest, or may survive only in the modified form of accidental journalism.

The essay, although invented by a great French writer, was very late in making itself at home in France. The so-called Essais of Leibnitz, Nicole, Yves Marie André and so many others were really treatises. Voltaire's famous Essai sur les mœurs des nations is an elaborate historical disquisition in nearly two hundred pages, the first of the great long essays. The Praelectiones of an essay, Maistre and of Lamennais were not essays at all in the literary sense. On the other hand, the admirable Causiers du lendemain of Sainte-Beuve (1804-1860) are literary essays in the fullness of the term, and have been the forerunners of a great army of brilliant essay-writing in France. Among those who have specially distinguished themselves as French essayists may be mentioned Théophile Gautier, Paul de saint-Victor, Anatole France, Jules Lemaitre, Ferdinand Brunetiére and Émile Faguet. All these are literary critics, and it is in the form of the analysis of manifestations of intellectual energy that the essay has been most successfully illustrated in France. All the countries of Europe, since the middle of the 19th century, have adopted this form of writing; such monographs or reviews, however, are not perfectly identical with the essay as it was conceived by Addison and Lamb. This last, it may be supposed, is a definitely English thing, and this view is confirmed by the fact that the language the word "essayist" has been adopted without modification.

In the above remarks it has been taken for granted that the essay is always in prose. Pope, however, conceived an essay in heroic verse. Of this his Essay on Criticism (1711) and his Essay on Man (1733-1734) are not good examples, for they are really treatises. The so-called Moral Essays (1720-1735), on the contrary, might have been contributed, if in prose, either to the Spectator or the Guardian. The idea of these essays, in verse, however, did not take any root in English literature. (E. G.)

ESSEG, ESSEGG or ESSEK (Hung. Essék; Croatian Osebek), a royal free town, municipality, and capital of the county of Virovitica (Vérösvásárhely), in Croatia-Slavonia, on the right bank of the Drave, 9 m. W. of its confluence with the Danube, and 185 m. S. of Buda-Pest by rail. Pop. (1900) 24,930; chiefly Magyars and Croats, with a few Germans and Jews. As Esseg the Drave is crossed by two bridges, and below these it is navigable by small steamers. The upper town, with the fortress, is under military authority; the new town and the lower town, which is the headquarters of commerce, are under civil authority. The only buildings of note are the Roman Catholic and Orthodox churches, Franciscan and Capuchin monasteries, synagogue, gymnasium, modern school, hospital, chamber of commerce, and law-courts. Esseg has a thriving trade in grain, fruit, live-stock, plum-brandy and timber. Tanning, silk-weaving and glass-blowing are also carried on.

Esseg owes its origin to its fortress, which existed as early as the time of the Romans under the name of Murcia; though the present structure dates only from 1720. At the beginning of the Hungarian revolution of 1848 the town was held by the Hungarians, but on the 4th of February 1849 it was taken by the Austrians under General Baron Trebersberg.

ESSEN, a manufacturing town of Germany, in the Prussian Rhine province, 22 m. N.E. from Düsseldorf, on the main line of railway to Berlin, in an undulating and densely populated district. Pop. (1849) 8853; (1875) 54,790; (1905) 92,770. It lies at the centre of a network of railways giving it access to all the principal towns of the Westphalian iron and coal fields. Its general aspect is gloomy; it possesses few streets of any pretensions, though those in the old part, which are mostly narrow, present, with their grey slate roofs and green shutters, a picturesque appearance. Esseen's famous edifices (twelve Roman Catholic, one Old Catholic, six Protestant churches, and a synagogue) the minster, dating from the 10th century, with fine pictures, relics and wall frescoes, is alone especially remarkable. This building is very similar to the Pfalz-Kapelle (capella
in palatio) at Aix-la-Chapelle. Among the town's principal secular buildings are the new Gothic town-hall, the post office and the railway station. There are several high-grade (classical and modern) schools, technical, mining and commercial schools, a theatre, a permanent art exhibition, and hospitals. Essen also has a beautiful public park in the immediate vicinity. The town originally owed its prosperity to the large iron and coal fields underlying the basin in which it is situated. Chief among its industrial establishments are the famous iron and steel works of the city, and the veld of Essen may be said to depend for its livelihood upon this firm, which annually expends vast sums in building and supporting churches, schools, clubs, hospitals and philanthropic institutions, and in other ways providing for the welfare of its employees. There are also manufactories of woolen goods and cigars, dyeworks and breweries.

Essen was originally the seat of a Benedictine nunnery, and was formed into a town about the middle of the 10th century by the abbess Hedwig. The abbess of the nunnery, who held from 1275 the rank of a princess of the Empire, was assisted by a chapter of ten princesses and countesses; she governed the town until 1803, when it was secularized and incorporated with Prussia. In 1807 it came into the possession of the grand dukes of Berg, but was transferred to Prussia in 1814.

ESSENES, a monastic order among the Jews prior to Christianity. Their first appearance in history is in the time of Jonathan the Maccabee (161-144 B.C.). How much older they may have been has no means of being determined, but our authorities agree in assigning to them a dateless antiquity.

The name occurs in Greek, in the two forms 'Esenoi' and 'Esenoi'. 'Esenoi' is used by Josephus fourteen times, 'Esenoi' six, but the latter is the only form used by Philo (ii. 457, 471, 632). 'Esenoi' is also used by Synesius and Hippolytus, and its Latin equivalent by Pliny and Solinus; 'Esenoi' by Hegesippus and Porphyry.

In Epiphanius we find the forms 'Esenoi', 'Esenoi', and 'Isenoi'. There is a place named Essen mentioned by Josephus (Ant. xiii. 10, § 3), from which the name may have been formed, just as the Christians were originally called Na'apyrei or Na'opyrei, from Nasara. This etymology, however, is not much in favour now. Lightfoot explains the name as meaning "the chosen," others as meaning "physicians." Perhaps there is most authority in favour of deriving it from the Syriac γη, which in the emphatic state becomes γης, so that we have a Semitic correspondence to both the Greek forms 'Esenoi and 'Esenoi. This etymology makes the word mean "pius." It has also been used in excuse for Philo's absurd derivation from δαυς.

The original accounts we have of them are confined to three authors—Philo, Pliny the Elder, and Josephus. Philo describes them in his treatise known as Quod omnibus probo libris (§§ 12, 13; ii. 457-460), and also in his "Apology for the Jews," a fragment of which has been preserved by Eusebius (Proc. Ev. viii. 11, 12). Pliny (N.H. v. 17) has a short but striking sketch of them, derived in all probability from Alexander Polybius, who is mentioned among the authorities for the fifth book of his Natural History. This historian, of whom Eusebius had a very high opinion (Proc. Ev. ix. 17, § 11), lived in the time of Sulla. Josephus treats of them at length in his Jewish War (ii. 8), and more briefly in two passages of his Antiquities (xiii. 5, §§ 9; xviii. 1, § 5). He has also interesting accounts of the prophetic powers possessed by three individual members of the sect—Judah (B.J. i. 1, § 5; Ant. xiii. 11, § 2), Menahem (Ant. xv. 10, § 9), and Simon (B.J. ii. 7, § 3; Ant. xvii. 13, § 3). Besides this he mentions an Essene Gate in Jerusalem (B.J. v. 4, § 2) and a person called John the Essene, one of the bravest and most capable leaders in the war against the Seleucids (B.J. ii. 20, § 5). Josephus himself made trial of the sect of Essenes in his youth; but from his own statement it appears that he must have been a very short time with them, and therefore could not have been initiated into the inner mysteries of the society (De vita sua, 2). After this the notices that we have of the Essenes from antiquity are mere reproductions, except in the case of Epiphanius (died A.D. 403), who, however, is so confused a writer as to be of little value.

Solinius, who was known as "Pliny's Ape," echoed the words of his master about a century after that writer's death, which took place in A.D. 79. Similarly Hippolytus, who lived in the reign of Commodus (A.D. 180-192), reproduced the account of Josephus, adding a few touches of his own. Porphyry (A.D. 213-305) afterwards did the same thing, but had the grace to mention Josephus in the context. Eusebius quoted the account as from Porphyry, though he must have known that he had derived it from Josephus (Proc. Ev. ix. 3, §§ 1, 13). But Porphyry's name would impress pagan readers. There is also a mention of the Essenes by Hegesippus (Eus. H.E. iv. 22) and by Synesius in his life of Dio Chrysostom. It has been conjectured that the Clementine literature emanated from Essenes who had turned Christian. (See Enomorres.)

The Essenes were an exclusive society, distinguished from the rest of the Jewish nation in Palestine by an organization peculiar to themselves, and by a theory of life in which a severe asceticism and a rare benevolence to one another and to mankind in general were the most striking characteristics. They had fixed rules for initiation, a succession of strictly separate grades within the limits of the society, and regulations for the conduct of their daily life even in its minutest details. Their membership was recruited only from those of outside marriage, and all intercourse with women were absolutely renounced. They were the first society in the world to condemn slavery both in theory and practice; they enforced and practised the most complete community of goods. They chose their own priests and public office-bearers, and even their own judges. Though their prevailing tendency was practical, and the tenets of the society were kept a profound secret, it is perfectly clear from the concurrent testimony of Philo and Josephus that they cultivated a kind of speculation, which not only accounts for their spiritual asceticism, but indicates a great deviation from the normal development of Judaism, and a profound sympathy with Greek philosophy, and probably also with Oriental ideas. At the same time we do our Jewish authorities no injustice in imputing to them the patriotic tendency to idealize the society, and thus offer to their readers something in Jewish life that would bear comparison at least with similar manifestations of Greek ideas.

There is some difficulty in determining how far the Essenes separated themselves locally from their fellow-countrymen. Josephus informs us that they had no single city of their own, but that many of them dwelt in every city. While in his treatise Quod omnibus, &c., Philo speaks of their avoiding towns and preferring to live in villages, in his "Apology for the Jews" we find them living in many cities, villages, and in great and prosperous towns. In Pliny they are a perennial colony settled on the western shore of the Dead Sea. On the whole, as Philo and Josephus agree in estimating their number at 4000 (Philo, Q.O.P.L. § 12; Jos. Ant. xviii. 1, § 5), we are justified in suspecting some exaggeration as to the many cities, towns and villages where they were said to be found. As agriculture was their favourite occupation, and as their tendency was to withdraw from the haunts and ordinary interests of mankind, we may assume that with the growing confusion and corruption of Jewish society they felt themselves attracted from the mass of the population to the sparsely peopled districts, till they found a congenial settlement and free scope for their peculiar view of life by the shore of the Dead Sea. While their principles were consistent with the neighbourhood of men, they were better adapted to a state of seclusion.

The Essenes did not renounce marriage because they denied the validity of the institution or the necessity of it as providing for the continuance of the Jewish race, but because they had a low opinion of the character of women (Jos. B.J. ii. 8, § 2; Philo, "Apol. for the Jews" in Eus. Proep. Ev. viii. xi. 1, § 8). They adopted children when very young, and brought them up on
their own principles. Pleasure generally they rejected as evil. They despised riches not less than pleasure; neither poverty nor wealth was observable among them; at initiation every one gave his property into the common stock; every member in receipt of wages handed them over to the funds of the society. In matters of dress the ascetism of the society was very pronounced. They regarded oil as a defilement, even washing it off if anointed with it against their will. They did not change their clothes or their shoes till they were torn in pieces or worn completely away. The colour of their garments was always white. Their daily routine is prescribed for them in the strictest manner. Before the rising of the sun they were to speak of nothing profane, but offered to it certain traditional forms of prayer as if beseeching it to rise. Thereafter they went about their daily tasks, working continuously at whatever trade they knew till the fifth hour, when they assembled, and, girding on a garment of linen, bathed in cold water. They next seated themselves quietly in the dining hall, where the baker set bread in order, and the cook brought each a single dish of one kind of food. Before meat and after it grace was said by a priest. After dinner they resumed work till sunset. In the evening they had supper, at which guests of the order joined them, if there happened to be any such present. Withal there was no noise or confusion to mar the tranquillity of their intercourse; no one usurped more than his share of the conversation; the stillness of the place oppressed a stranger with a feeling of mysterious awe. This composure of spirit was owing to their perfect temperance in eating and drinking. Not only was the daily routine of industry prescribed, but generally, the activity of the members was controlled by their presidents. In only two things could they take the initiative, helpfulness and mercy; the deserving poor and the destitute were to receive instant relief; but no member could give anything to his relatives without consulting the heads of the society. Their office-bearers were elected. They had also their special courts of justice, which were composed of not less than twenty members, and their scribes, daily, decisions, which were arrived at with extreme care, were irreversible. Oaths were strictly forbidden; their word was stronger than an oath. They were just and temperate in anger, the guardians of good faith, and the ministers of peace, obedient to their elders and to the majority. But the moral characteristics which they most earnestly cultivated and enjoined will best appear in their rules of initiation. There was a novitiate of three years, during which the intending member was tested to his fitness for entering the society. If the result was satisfactory, he was admitted, but before partaking of the common meal he was required to swear awful oaths, that he would reverence the deity, do justice to men, hurt no man voluntarily or at the command of another, hate the unjust and assist the just, and that he would render fidelity to all men, but especially to the rulers, seeing that no one rules but of God. He also vowed, if he should bear rule himself, to make no violent use of his power, nor outshine those set under him by superior display, to make it his aim to cherish the truth and unmask liars, to be pure from theft and unjust gain, to conceal nothing from his fellow-members, nor to divulge any of their affairs to other men, even at the risk of death, to transmit their doctrines unchanged, and to keep secret the books of the society and the names of the angels.

Within the limits of the society there were four grades so distinct that if any one touched a member of an inferior grade he cleanse himself by bathing in water; members who had been found guilty of serious crimes were expelled from the society, and could not be received again till reduced to the very last extremity of want or sickness. As the result of the ascetic training of the Essenes, and of their temperate diet, it is said that they lived to a great age, and were superior to pain and fear. During the Roman war they cheerfully underwent the most grievous tortures rather than break any of the principles of their faith. In fact, they had in many respects reached a very high pitch of moral elevation attained by the ancient world; they were just, humane, benevolent, and spiritually-minded; the sick and aged were the objects of a special affectionate regard; and they condemned slavery, not only as an injustice, but as an impious violation of the natural brotherhood of men (Philo ii. 457). There were some of the Essenes who permitted marriage, but strictly with a view to the preservation of the race; in other respects they agreed with the main body of the society.

It will be apparent that the predominant tendency of the society was practical. Philo tells us expressly that they rejected logic as unnecessary to the acquisition of virtue, and speculation on nature as too lofty for the human intellect. Yet they had views of their own as to God, Providence, the soul, and a future state, which, while they had a practical use, were yet essentially speculative. On the one hand, indeed, they held tenaciously by the traditional Judaism: blasphemy against their lawgiver was punished with death, the sacred books were preserved and read with great reverence, though not without an allegorical interpretation, and the Sabbath was most scrupulously observed. But in many important points their deviation from the strict path of Judaic development was complete. They rejected animal sacrifice as well as marriage; the oil with which priests and kings were anointed they accounted unclean; and the condemnation of oaths and the community of goods were unmistakable innovations for which they found no hint or warrant in the old Hebrew writings. Their most singular feature, perhaps, was their reverence for the sun. In their speculative hints respecting the soul and a future state, we find another important deviation from Judaism, and the explanation of their asceticism. Not only was the daily routine of industry prescribed, but that the soul is immortal, but, coming from the sublimest ether, is lured as by a sorcery of nature into the prison-house of the body. At death it is released from its bonds, as from long slavery, and joyously soars aloft. To the souls of the good there is reserved a life beyond the ocean, and a country oppressed by neither rain, nor snow, nor heat, but refreshed by a gentle west wind blowing continually from the sea (cf. Hom. Od. iv. 566-568), but to the wicked a region of wintry darkness and unceasing torment. Josephus tells us too that the Essenes believed in fate; but in what sense, and what relation it bore to Divine Providence, does not appear.

The above evidence has left students in doubt as to whether Essenisim is to be regarded as a pure product of the Jewish mind or as due in part to some foreign influence. On the one hand it might be maintained that the Essenes out-Pharisaed the Pharisees. They had in common with that sect their venera- tion of the temple and of the sacrifices, and their belief in some form of ceremonial purification, and their tendency towards fatalism. But if the Pharisees abstained from good works on the Sabbath, the Essenes abstained even from natural necessities (Jos. B.J. ii. 8, § 3); if the Pharisees washed, the Essenes bathed before dinner; if the Pharisees ascribed some things to Fate, the Essenes ascribed all (Jos. Ant. xiii. 5, § 9). But on the other hand the Essenes avoided marriage, which the Pharisees held in honour; they offered no animal-sacrifices in the Temple; they refrained from the use of oil, which was customary among the Pharisees (Luke vii. 46): above all, they offered prayers to the sun, after the manner denounced in Ezekiel (viii. 16). These and other points of divergences are not explained by Ritschel's interesting theory that Essenisim was an organized attempt to carry out the idea of "a kingdom of priests and an holy nation" (Ex. x. 6). Granting then that some foreign influence was at work in Essenisim, we have four theories offered to us—that this influence was Persian, Buddhist, Pythagorean, or lastly, as maintained by Lipsius, that of the surrounding Syrian heathenism. Each of these views has had able advocates, but it must not be supposed that they are mutually exclusive. If we consider how Philo, while remaining a devout Jew in religion, yet managed to assimilate the whole Stoic philosophy, we can well believe that the Essenes might have been influenced, as Zeller maintained that they were, by Neo-Pythagoreanism. But as Pythagoras was a Greek, his doctrine being of a distinctly Oriental, if any, it may very well be that both he and the Essenes drew from a common source; for there is no need to reject, as
is so commonly done, the statements of our authorities as to the antiquity of the Essenes. This common source we may believe with Lightfoot to have been the Persian religion, which we know to have profoundly influenced that of Israel, independently of the Essenes.

The fact that the Pharisees and Sadducees so often figure in the earlier part of the New Testament, while the Essenes are never mentioned, might plausibly be interpreted to show that the New Testament emanated from the side of the Essenes. So far as concerns the Epistle of St James this interpretation would probably be correct. That work contains the doctrine common to the Essenes with Plato, and suggestive of Persian Dualism, that God is the author of good only. There are also certain obvious points of resemblance between the Essenes and the early Christians. Both held property in common; both had scattered communities which received guests one from the other; both avoided a light use of oaths; both taught passive obedience to political authority. The list might be enlarged, but it would not necessarily prove more than that the early Christians shared in the ideas of their age. Christianity was still to some extent a popularization of Essenism, but there is little reason for believing that Jesus himself was an Essene. De Quincey's contention that there were no Essenes but the early Christians is therefore misleading.

The original sources of our knowledge of the Essenes have been mentioned at the beginning of this paper; the best modern discussions of them are to be found in such works as Zell (Z. Theol. 1869, 276-281); Reuss, Die Geschichte der sogen. Anachoretengemeinden, ii. 201-202; Keil, 'Esseni,' and in his 'Religion of the Jews,' vol. ii. 173-176; Kahlen, 'Die Religionsgeschichte der Juden,' i. 355; Schurer, 'Geschichte der Juden,' ii. 479-480; and especially massive, but very useful, is his 'Ethnographie des Orient.' The information that the Essenes were of Persian origin has been derived from a work by the Persian grammarian and historian, Ibn Khurdadbe.

ESSENTUKI—ESSEX, EARLS OF 781

ESSEX, Arthur Capel, 1St EARL OF (1612-1683). English statesman, son of Arthur, 1St Baron Capel of Hadham (c. 1641), executed in 1649, and of Elizabeth, daughter and sole heir of Sir Charles Morrison of Cashelbury in Hertfordshire, and later married to the sickly son of the earl of Essex. In 1668 the earl of Essex, then a sickly boy of sixteen, was taken by Fairfax's soldiers from Hadham to Colchester, where his father was defending, and carried every day round the works with the hope of inducing Lord Colurc to surrender the place. At the restoration he was created Viscount Malden and earl of Essex (20th of April 1661), with special remainder to the male issue of his father, and was made lord-lieutenant of Hertfordshire and a few years later of Wilts and Wiltshire.

Heearly showed himself antagonistic to the court, to Roman Catholicism, and to the extension of the royal prerogative, and was coupled by Charles II. with Holles as 'stiff and stubborn men,' who would not yield against their convictions to his solicitations. In 1669 he was sent as ambassador to King Christian V. of Denmark, in which capacity he gained credit by refusing to strike his flag to the governor of Kronborg. In 1672 he was made a privy councillor and took the "nuncio's" place. In 1677 the earl of Essex, in office till 1677, and his administration was greatly condemned by Burnet and Ormonde, the former describing it "as a pattern to all that come after him." He identified himself with Irish interests, and took immense pains to understand the constitution and the political necessities of the country, appointing men of real merit to office, and maintaining an exceptional independence from solicitation and influence. He held a just balance between the Roman Catholics, the English Church and the Presbyterians, protecting the former as far as public opinion in England would permit, and governing the native Irish with firmness and moderation. The purity and patriotism of his administration were in strong contrast to the hopeless corruption prevalent in that at home and naturally aroused bitter opposition, as an obstacle to the unscrupulous employment of Irish revenues for the satisfaction of the court and the king's expenses. In particular he came into conflict with Lord Ranelagh, to whom had been assigned the Irish revenues on condition of his supplying the requirements of the crown, and whose accounts Essex refused to pass. He opposed strongly the lavish gifts of forfeited estates to court favourites and mistresses, prevented the grant of Phoenix Park to the duchess of Cleveland, and refused to encumber the administration by granting reversions. Finally the intrigues of his enemies at home, and Charles's continual demands for money, which Ranelagh undertook to satisfy, brought about his fall in April 1679. He immediately joined the country party and the opposition to Danby's government, and on the latter's fall in 1679 was appointed a commissioner of the treasury, and the same year a member of Sir William Temple's new-modelled council. He followed the lead of Halifax, who advocated not the exclusion of James, but the limitation of his sovereign powers, and looked to the prince of Orange rather than to Monmouth as the leader of Protestantism, incurring thereby the hostility of Shaftesbury, but at the same time gaining the confidence of Charles. He was appointed by Charles together with Halifax to hear the charges against Lauderdale. In July he wrote a wise and statesmanlike letter to the king, advising him to renounce his project of raising a new company of guards. Together with Halifax he urged Charles to summon the parliament, and after his refusal resigned the treasury in November, the real cause being, according to one account, the stand upon the treasury by the duchess of Cleveland for £25,000 according to the terms of the purchase of French money, "that makes my Lord Essex's squeasy stomach that it can no longer digest his employment," 4

Subsequently his political attitude underwent a change, the exact cause of which is not clear—probably a growing conviction of the dangers threatened by a Roman Catholic sovereign of the character of James. He now, in 1650, joined Shaftesbury's party and supported the Exclusion Bill, and on its rejection by the Lords carried a motion for an association to execute the scheme of expedients promoted by Halifax. On the 25th of January 1651 at the head of fifteen peers he presented a petition to the king, couched in exaggerated language, requesting the abandonment of the session of parliament at Oxford. He was a jealous prosecutor of the Roman Catholics in the popish plot, and voted for Stafford's attender, on the other hand interceding for Archbishop Plunket, implicated in the pretended Irish plot. He, however, refused to follow Shaftesbury in his extreme courses, declined participation in the latter's design to seize the Tower in 1652, and on Shaftesbury's consequent departure from England became the leader of Monmouth's faction, in which were now included Lord Russell, Algernon Sidney, and Lord Howard of Escrick. Essex took no part in the wilder schemes of the party, but after the discovery of the Rye House Plot in June 1683, and the capture of the leaders, he was arrested at Cashiourby and imprisoned in the Tower. His spirits and fortitude appear immediately to have abandoned him, and on the 15th of October he was discovered in his chamber with his throat cut. His death was attributed, quite groundlessly, to Charles and James, and the evidence points clearly if not conclusively to suicide, his motive being possibly to prevent an attender and preserve his estate for his family. He, was, however, undoubtedly a victim of the Stuart administration, and the antagonism and tragic end of men like Essex, deserving men, naturally devoted to the throne, constitutes a severe indictment of the Stuart rule.

He was a statesman of strong and sincere patriotism, just and unselfish, conscientious and laborious in the fulfillment of public duties, blameless in his official and private life. Evelyn describes him as "a sober, wise, judicious and ponderous person, not illiterate beyond the rule of most noblemen in this age, very well versed in English history and affairs, industrious, frugal, methodical and very way accomplished"; and declares he was much deplored, few believing he had ever harboured any seditious designs. He married Lady Elizabeth Percy, daughter of Algernon, 10th earl of Northumberland, by whom, besides a daughter, he had an only son Algernon (1670-1710), who succeeded him as 2nd earl of Essex.

BIBLIOGRAPHY.—See the Lives in the Dict. of Nat. Biography and in Biographia Britannica (Kippis), with authorities there collected; Essex's paper correspondence is in the State Papers in the British Museum, Nos. 200-207, and selections have been published in Letters written by Arthur Capel, Earl of Essex (1770) and in the Essex Papers (C Camden Society, 1890), to which can now be added the Calendar of State Papers, Domestic, which contains a large number of his letters and which strongly support the opinion of his contemporaries concerning his unselfish patriotism and industry; see also Somers Tracts (1613), x., and for other pamphlets relating to his death the catalogue of the British Museum.

ESSEX, ROBERT DEVEREUX, 2ND EARL OF (1556-1601), son of the 1st Devereux earl, was born at Netherwood, Herefordshire, on the 19th of November 1556. He entered the university of Cambridge and graduated in 1581. In 1583 he accompanied his stepfather, the earl of Leicester, on an expedition to Holland, and greatly distinguished himself in the battle of Phillip's Place. He now took his place at court, where so handsome a young man soon found favour with Queen Elizabeth, and in consequence was on bad terms with Raleigh. In 1587 he was appointed master of the horse, and in the following year was made general of the horse and installed knight of the Garter. On the death of Leicester he succeeded him as chief favourite of the queen, a position which injuriously affected his whole subsequent life, and ultimately resulted in his ruin. While Elizabeth was approaching the mature age of sixty, Essex was scarcely twenty-one. Though well aware of the advantages of his position, and somewhat vain of the queen's favour, his constant attendance on her at court was irksome to him beyond all endurance; and when he could not make his escape to the scenes of foreign adventure after which he longed, he varied the monotony of his life at court by intrigues with the maids of honour. He fought a duel with Sir Charles Blount, a rival favourite of the queen, in which the earl was disarmed and slightly wounded in the thigh.

In 1590, without the queen's consent, he joined the expedition of Drake and Sir John Norris against the Spaniards, but in June he was compelled to obey a letter enjoining him at his "uttermost peril" to return immediately. In 1590 Essex married the widow of Sir Philip Sidney, but in dread of the queen's anger he kept the marriage secret as long as possible. When it was necessary to avow it, her rage at first knew no bounds, but as the earl did "use it with good temper," and "for her majesty's better satisfaction was pleased that my lady should live retired in her mother's house," he soon came to be "in very good favour." In 1591 he was appointed to the command of a force auxiliary to one formerly sent to assist Henry IV. of France against the Spaniards; but after a fruitless campaign he was finally recalled from the command in January 1592. For some years after this most of his time was spent at court, where he held a position of unexampled influence, both on account of the favour of the queen and from his own personal popularity. In 1596 he was, after a round of humours, discovered in his chamber with his throat cut. His death was attributed, quite groundlessly, to Charles and James, and the evidence points clearly if not conclusively to suicide, his motive being possibly to prevent an attender and preserve his estate for his family. He was, however, undoubtedly a victim of the Stuart administration, and the antagonism and tragic end of men like Essex, deserving men, naturally devoted to the throne, constitutes a severe indictment of the Stuart rule.

Francis Bacon, at that time his most intimate friend, endeavoured to prevent the threatened rupture by writing him a letter of advice; and although perseverance in a long course of feigned action was for Essex impossible, he for some time attended pretty closely to the hints of his mentor, so that the queen "used him most graciously." In 1597 he was appointed master of the ordnance, and in the following year he obtained command of a company against Spain, known as the Islands or Azores Voyage. He gained some trifling successes, but as the Plate fleet escaped him he failed of his main purpose; and when on his return the queen met him with the usual reproaches, he retired to his home at Wanstead. This was not what Elizabeth desired, and although she conferred on Lord Howard of Effingham the earldom of Nottingham for services at Cadiz, the main merit of which was undoubtedly claimed by Essex, she ultimately held him in such hateful contempt, and when she, unable to control her indignation, slapped him on the face, he left her presence swearing that such an insult he would not have endured even from Henry VIII.

In 1599, while Ulster was in rebellion under the earl of Tyrone, the office of lieutenant and governor-general of Ireland was conferred on Essex, and a large force put at his command.
His campaign was an unsuccessful one, and by acting in various ways in opposition to the commands of the queen and the council, agreeing with Tyrone on a truce in September, and suddenly leaving the post of duty with the object of privately vindicating himself before the queen, he laid himself open to charges more serious than that of mere incompetency. For these misdemeanours he was brought in June 1600 before a specially constituted court, deprived of all his high offices, and ordered to be a prisoner in his own house during the queen’s pleasure. Charles was relieved through the intervention of the Lords, was shortly afterwards restored to him, but he was ordered not to return to court. For some time he hoped for an improvement in his prospects, but when he was refused the renewal of his patent for sweet wines, hope was succeeded by despair, and half maddened by wounded vanity, he made an attempt (Feb. 7, 1601) to incite a revolution in his behalf, by parading the streets of London with 300 retainers, and shouting, “For the queen! a plot is laid for my life!” These proceedings awakened, however, scarcely any other feelings than mild perplexity and wonder; and finding that hope of assistance from the citizens was vain, he returned to Essex House, where after defending himself for a short time he surrendered. After a trial—in which Bacon, who prosecuted, delivered a speech against his quondam friend and benefactor, the bitterness of which was quite unnecessary to secure a conviction entailing at least very severe punishment upon him—he was condemned to death, and notwithstanding many alterations in Elizabeth’s mood, the sentence was carried out on the 25th of February 1601.

Essex was in person tall and well proportioned, with a countenance which, though not strictly handsome, possessed, on account of its bold, cheerful and amiable expression, a wonderful power of fascination. He was a patron of literature, and himself a poet. His carriage was not very graceful, but his manners are said to have been “courtly, grave and exceedingly comely.” He was brave, chivalrous, impetuous, impulsive sometimes with his equals, but generous to all his dependants and incapable of secret malice; and these virtues, which were innate and which remained with him to the last, must be regarded as somewhat counterbalancing, in our estimation of him, the follies and vices created by temptations which were exceptionally strong.

See Hon. W. B. Devereux, *Lives of the Earls of Essex* (1853); and *Bacon and Essex*, by E. A. Abbot (1907). Also the article *Bacon, Francis, and authorities there*.

**ESSEX, ROBERT DEVEREUX,** 3rd Earl of (1591–1655), son of the preceding, was born in 1591. He was educated at Eton and at Merton College, Oxford. Shortly after the arrival of James I. in London, Essex (whose title was restored, and the attainder on his father removed, in 1604) was placed about the prince of Wales, as a sharer both in his studies and amusements. At the early age of fifteen he was married to Frances Howard, daughter of the earl of Suffolk, but she was his wife only in name, during his absence abroad (1605–1609) she fell in love with Sir Robert Carr (afterwards earl of Somerset), and on her charging her husband with physical incapacity, the marriage was annulled in 1613. A second marriage which he contracted in 1631 with Elizabeth, daughter of Sir William Paulet, also ended unhappily. From 1620 to 1623 he served in the wars of the Palatinate, and in 1625 he was vice-admiral of a fleet which made an unsuccessful attempt to capture Cadiz. In 1630 he was lieutenant-general of the government by Charles against the Scottish Covenanters; but on account of the irresolution of the king no battle occurred, and the army was disbanded at the end of the year. Essex was discharged “without ordinary ceremony,” and refused an office which at that time fell vacant, “all which,” says Clarendon, “wrought very much upon his rough, proud nature, and made him susceptible of some impressions afterwards which otherwise would not have found such easy admission.” Having taken the side of the parliament against Charles, he was, on the outbreak of the civil war in 1642, appointed to the command of the parliamentary army.

At the battle of Edgehill he remained master of the field, and in 1643 he captured Reading, and relieved Gloucester; but in the campaign of the following year, on account of his hesitation to fight against the king in person, nearly his whole army fell into the hands of Charles. In 1645, on the passing of the self-denying ordinance, providing that no member of parliament should hold a public office, he resigned his commission; but on account of his past services his annuity of £20,000 was continued to him for life. He died on the 14th of September 1646, of a fever brought on by over-exertion in a stag-hunt at Windsor Forest; his line became extinct.

**ESSEX, WALTER DEVEREUX,** 1st Earl of (1541–1576), the eldest son of Sir Richard Devereux, was born in 1541. His grandfather was the 2nd Baron Ferrers, who was created Viscount Hereford in 1550 and by his mother was a nephew of Henry Bourchier, a former earl of Essex. Walter Devereux succeeded as 2nd Viscount Hereford in 1558, and in 1561 or 1562 married Lettice, daughter of Sir Francis Knollys. In 1560 he served as high marshal of the field under the earl of Warwick and Lord Clinton, and materially assisted them in suppressing the northern insurrection. For his zeal in the service of Queen Elizabeth on other occasions, in 1572, when he was created earl of Essex, the title which formerly belonged to the Bourchier family. Eager to give proof of “his good devotion to employ himself in the service of her majesty,” he offered on certain conditions to subdue and colonize, at his own expense, a portion of the Irish province of Ulster, at that time completely under the dominion of the rebels O’Neills, under Sir Brian MacPhelim and Turlough Luineach, with the Scots under their leader Sorley Boy MacDonnell. His offer, with certain modifications, was accepted, and he set sail for Ireland in July 1573, accompanied by a number of earls, knights and gentlemen, and with a force of about 1200 men. The beginning of his enterprise was inauspicious, for on account of a storm which dispersed his fleet and drove some of his vessels as far as Cork and the Isle of Man, his forces did not all reach the place of rendezvous till late in the autumn, and he was compelled to entrench himself at Belfast for the winter. Here, by sickness, famine and desertions, his troops were diminished to little more than 200 men. Intrigues of various sorts, and fighting of a guerilla type, followed with disappointing results, and Essex had difficulties both with the deputy Fitzwilliam and with the queen. Essex was in straits himself, and his offensive movements in Ulster took the form of raids and brutal massacres among the O’Neills; in October 1574 he treacherously captured MacPhelim at a conference in Belfast, and after slaughtering his attendants gave him and his wife and another executed at Dublin. Elizabeth, instigated apparently by Leicester, ordered Essex to prepare to attack the Irish chief Turlough Luineach, suddenly commanded him to "break off his enterprise"; but, as she left him a certain discretionary power, he took advantage of it to defeat Turlough Luineach, chastise Antrim, and massacre several hundreds of Sorley Boy’s following, chiefly women and children, discovered hiding in the caves of Rathlin. He returned to England in the end of 1575, resolved "to live henceforth an honest life"; but a suit ultimately paralyzed and the offer of the queen to make him earl marshal of Ireland. He arrived in Dublin in September 1576, and three weeks afterwards died of dysentery. There were suspicions that he had been poisoned by Leicester, who shortly after his death married his widow, but these were not confirmed by the post-mortem examination. The endeavours of Essex to better the condition of Ireland were a dismal failure; and the massacres of the O’Neills and of the Scots of Rathlin leave a dark stain on his name.

**ESSEX,** an eastern county of England, bounded N. by Cambridgeshire and Suffolk, E. by the North Sea, S. by the Thames, &c.
Agriculture.—As an agricultural county Essex ranks high. Some four-fifths of the total area is under cultivation, and about one-third of that area is in permanent pasture. Wheat, barley and oats, in that relative order, are the principal grain crops, Essex being one of the chief grain-producing counties. The wheat and barley are in particularly high favour, the wheat in the south-west, and the barley in the north-east. For seed purposes, while the barley is especially useful in making. Beans and peas are largely grown, as are vegetables for the London market. Hop-growing was once important. From the comparative dryness of the climate Essex does not excel in pastureage, and winter grazing receives the more attention. The numbers of cattle increase steadily, and store bullocks are introduced in large numbers from Norfolk, Lincolnshire, Ireland and Wales. Of sheep there are but few distinct flocks, and the numbers decrease. Figs are generally of a high-class Berkshire type.

Other Industries.—The south-west of the county, being contiguous to London, is very densely populated, and is the seat of large and varied industries. For example, there are numbers of chemical works, the extensive engine shops and works of the Great Eastern railway at Stratford, government powder works in the vicinity of Waltham Abbey, and powder stores at Purfleet on the Thames. The extensive water-works for east London, about 12 miles north of the city, near Woodford, is a great irregural inlet (Hamford Water) receiving no large stream, W. of the Naze promontory, and then the Stour, bounding the county on the north, joins its estuary to that of the Orwell near the sea. There are several seaside watering-places in favour owing to their proximity to London, of which Southend-on-Sea above the mouth of the Thames, Clacton-on-Sea, Walton-on-the-Naze, and Dovercourt adjoining Harwich are the chief. These and other watering places on the estuaries of the Thames are in favour with yachtsmen. The sea has at some points seriously encroached upon the land within historic times. The slow soft cliffs at various points are liable to give way against the waves; in other parts dykes and embankments are necessary to prevent inundation. Inland, that is apart from the flat coast-district, the country is pleasantly undulating and for the most part well wooded. It was formerly, indeed, almost wholly forested, the great Waltham Forest stretching from Colchester to the confines of London. Of this a fragment is preserved in Epping Forest (see Epping) between the Lea and the Roding. On the other side of the Roding Hainault Forest is traceable, but was disappeared in 1853. The oak is the principal tree; a noteworthy example was that of Fairlop in Hainault, which measured 45 ft. in girth, but was blown down in 1820.

Geology.—The geological structure of the county is very simple; the granite, which occupies the country between Epping Forest and Oakley, and is well exposed on the northern side of the Naze and in the north of the county, is cut through by the London clay with Bagshot greensands and Bacho quarries. The green shales and sandstones of the London clay are often very fossiliferous. The beds of the Thames near Walthamstow, Buckhurst Hill, Chadwell, Loughton, Epping, Ongar, etc., are the London clay. The Naze between the Roding and the Lea is a wide flat valley which is covered by the Lea. The Naze, south of the Lea, is a wide flat valley which is covered by a superficial deposit of glacial drifts, sands, gravel and pebbles, as at Epping, Chingford, and Walthamstow, and in the bed of the Lea, where the drift lies beneath the Thames gravel. An interesting feature in relation to the glacial drift is a deep trough in the Cam valley, probably the former course of a river, 350 ft. deep, at North Watford, and remains of hippopotamus, rhinoceros and mammoth. More recent alluvial deposits are found in the valley of Walthamstow and Tilbury, in the mosque of the Lea. The old road of the county, which is in the clay with a clay soil foundation were for generations repaired with flints picked by women and children from the surface of the fields. Gravel is difficult of access. With the exception, almost, of the Romford road at Grays and Tilbury, has been developed. The roads of this county with a clay soil foundation were for generations repaired with flints picked by women and children from the surface of the fields. Gravel is difficult of access. With the exception, almost, of the Romford road at Grays and Tilbury, has been discovered.

The towns besides the great docks at Plaistow (Victoria and Albert) and the deep-water docks at Tilbury, the principal calling places for vessels are Grays, Purfleet and Southend, while Barking on the Roding has also shipping trade, and the Less affords important water-connections. Elsewhere, the principal port is Harwich, at the mouth of the Stour, one of the chief ports of England for European passenger traffic. Other towns ranking as lesser estuarine ports are: Brighlingsea and Wivenhoe on the Colne, forming a member of the Cinque Port of Sandwich; Colchester, Maldon on the Blackwater, and Burnham-on-Crouch. The Stour, Chelmer, and Lea and Stort are the principal navigable inland waterways.
or Epping, Mid or Chelmsford, South-eastern, Southern or Romford, South-western or Walthamstow, returning one member each. The municipal boroughs are—Chelmsford (38,208), Colchester (38,733), East Ham (66,018), Harwich (10,070), Maldon (55,65), Saffron Walden (58,906), Southend-on-Sea (38,575), and one county borough, West Ham (267,358). The following are the other urban districts—Barking Town (21,547), Brentnake (35,203), Brentwood (49,022), Brightlingsea (45,074), Burnham-on-Crouch (29,192), Chingford (4732), Clacton (7450), Epping (3780), Frinton-on-Sea (644), Gray's Thurrock (13,834), Halstead (6073), Ilford (41,234), Leigh-on-Sea (3667), Leyton (98,912), Loughton (4730), Romford (13,650), Shoeburyness (4081), Waltham Holy Cross (6549), Walthamstow (95,131), Walton-on-the-Naze (2014), Wanstead (9176), Witham (3454), Wivenhoe (2960), Woodford (13,798). Essex is in the South-eastern circuit, and assizes are held at Chelmsford. The boroughs of Harwich and Southend-on-Sea have separate commissions of the peace, and the boroughs of Colchester, Maldon, Saffron Walden and West Ham have, in addition, separate courts of quarter sessions. The county is ecclesiastically within the diocese of St Albans (with a small portion within that of Ely) and is divided into two archdeaconries; containing 452 parishes or districts wholly or in part. There are 399 civil parishes.

There is a military station and depot for recruits at Wareley, and a great gunnery establishment at Shoeburyness. There is a school of gunnery and an extensive ground for testing government artillery of the largest calibre.

History (see also below under Essex, Kingdom of)—Essex probably originated as a shire in the time of Ethelstan. According to the Domesday Survey it comprised nineteen hundreds, corresponding very closely in extent and in name with those of the present day. The additional half-hundred of Thureslun on the Suffolk border has disappeared; Withcresherna is now Denjoy; and the liberty of Havering-atte-Bower appears to have been taken out of Becontree. Essex and Hertfordshire were under one sheriff until the time of Elizabeth. At the time of the Survey Count Eustace held a vast fief in Essex, and the court of the Honour of Boulogne was held at Witham. Bently Heath in Dagenham, Hundred Heath in Tendring and Castle Hedingham in Hinckford were the meeting-places of their respective hundreds. The stewardship of the forest of Essex was held by the earls of Oxford until deprived of it for adherence to the Lancastrian cause. In 1421 certain parts of Essex inherited by Henry V. from his mother were brought under the jurisdiction of the duchy of Lancaster.

Essex was part of the see of London from the time of the foundation of the bishopric in the 7th century. The archdeaconries are first mentioned in 1108; that of Essex extended over the south of the county and in 1291 included eight deaneries; the north and north-east of the county was divided between the archdeaconries of Middelsex and Colchester, comprising three and six deaneries respectively. Colchester was constituted a suffragan bishopric by Henry VIII. In 1836 Essex was transferred to the diocese of Rochester, with the exception of nine parishes which remained in London. In 1845 the archdeacon of Middlesex ceased to exercise control in Essex, and the deaneries were readjusted. In 1875 Essex was transferred to the newly created diocese of St Albans, but archdeacons continued in the charge of eighteen deaneries and that of Colchester into sixteen.

Owing to its proximity to the capital Essex was intimately associated with all the great historical struggles. The nobility of Essex took a leading part in the struggle for the charter, and of the twenty-four guardians of the charter, four were Essex barons. The castles of Pleshey, Chelmsford, and Hedingham were held against the king in the Barons' War of the reign of Henry III. The county was divided between the wapentakes of 1381. During the Wars of the Roses the Lancastrian cause was supported by the de Veres, while the Bouchiers and Lord Fitz-Walter were among the Yorkist leaders. Several Essex men were concerned in the Gunpowder Plot, and in the Civil War of the 17th century the county rendered valuable aid to the parliament.

After the Conquest no Englishman retained estates in Essex of any importance, and the chief lay barons at the time of the Survey were Geoffrey de Mandeville and Aubrey de Vere. The de Veres, earls of Oxford, were continuously connected with the county until the extinction of the title two centuries ago. Pleshey was the stronghold of the Mandevilles, and, although the house became extinct in 1189, its descendants in the female line retained the title of earls of Essex. The Honour of Hattfield Peverel, held by Ranulf Peverel after the Conquest escheated to the crown in the reign of Henry I, and in the same reign the fief of Robert Gernon passed to the house of Montfichet.

Essex has always been mainly an agricultural county, and the ordinary agricultural pursuits were carried on at the time of the Domesday Survey, which also mentions salt-making, wine-making, bee-culture and cheese-making, while the oyster fisheries have been famous from the earliest historic times. The woolen industry dates back to Saxon times, and for many centuries ranked as the most important industry. Cloth-weaving was introduced in the 14th century, and in the 16th century Colchester was noted for its "bays and says." Colchester also possessed a valuable leather industry in the 16th century, at which period Essex was considered an exceptionally wealthy and prosperous county; Norden, writing in 1594, describes it as a" fat, fruteful, and full of all profitable things." The decline of the cloth industry in the 17th century caused great distress, but a number of smaller industries began to take its place. Saffron-culture and silk-weaving were extensively carried on in the 17th century, and the 18th century saw the introduction of the straw-plait industry, potash-making, calico-printing, malting and brewing, and the manufacture of Roman cement.

The county returned four members to parliament in 1290. From 1395 it returned two members for the county and two for Colchester. Maldon acquired representation in 1331 and Harwich in 1604. Under the Reform Act of 1832 the county returned four members in four divisions. Under the Representation of the People Act of 1868 Maldon and Harwich each lost one member, and the county returned six members in three divisions.

Antiquities.—It is supposed by many antiquaries that Saxon masonry can be detected in the foundations of several of the Essex churches, but, with the exception of Ashington church tower, believed to have been erected by Canute after his victory over Edmund Ironside, there is no obviously recognizable building belonging to that period. This is probably to be in part ascribed to the fact that the comparative scarcity of stone and the unusual abundance of timber led to the extensive employment of the latter material. Several of the Essex churches, as Blackmore, Mountnessing, Margaretting, and South Benfleet, have massive stones and St Andrew's Church, Southend, with its walls of solid oak, continues an almost unique example of its kind. Of the four round churches in England one is in Essex at Little Maplestead; it is both the smallest and the latest. The churches of South Weald, Hadleigh, Blackmore, Heybridge and Hadstock may be mentioned as containing Norman work; with the church of Castle Hedingham for its fine Transitional work; Southchurch, Danbury and Boreham as being early English; St Andrew's, Southend, some specimens of Decorated architecture; and Messing, Thaxted, Saffron Walden, and the church of St Peter ad Vincula at the small town of Coggeshall, near Colchester, as specimens of Perpendicular. Stained glass windows have left their traces in several of the churches, the finest remains being those of Margaretting, which represent a tree of Jesse and the daisy or herb Margaret. Paintings have evidently been largely used for internal decoration: a remarkable series, probably of the 12th century, but much restored in the 14th, exists in the chancel of Copford church; and in the church at Ingatestone there was discovered in 1868 an almost unique fresco representation of the seven deadly sins. The oldest brasses preserved in the county are those of Sir William Fitz-Ralph at Pemmarsh, about 1373; Richard of Belton, at Corringham, 1430; Sir John Gifford, at Bowers
Gifford, 1348; Ralph de Kneyton, at Aveley, 1370; Robert de Swynbourne, at Little Horkesley, 1391; and Sir Ingelram de Bruyn, at South Ockendorn, 1400. The brass of Thomas Heron, aged 14, at Little Ilford, though dating only from 1517, is of interest as a picture of a schoolboy of the period. Ancient wooden effigies are preserved at Danbury, Little Leighs and Little Hadleigh.

Essex was rich in monastic foundations, though the greater number have left but meagre ruins behind. The Benedictines had an abbey at Saffron Walden, nunneries at Barking and Wickes, and priories at Earl's or Monk's Colne and Castle Hedingham; the Augustinian canons had an abbey at Waltham (see Waltham Abbey; the portion remaining shows Norman work of the finest character), priories at Thoby, Blackmore, Bicknacre, Little Leighs, Little Dunmow and St Osyth (see Brightlingsea); there were Cistercian abbeys at Coggeshall, Stratford and Tilty; the Cluniac monks were settled at Frittiewell, the Premonstratensians at Beale Abbey, and the Knights Hospitallers at Little Maplestead. Barking Abbey is said to date its first origin from the 7th century; most of the others arose in the 12th and 13th centuries. Besides the keep at Colchester there is a fine Norman castle at Castle Hedingham, and two dilapidated round towers still standing at Hadleigh near the sea. On Longmynd Hill, the site of the de Lacy's, and Pleasley, the seat of the earls of Essex, have left only mounds. Havereng-atte-Bower, the palace that was occupied by many queens, is replaced by a modern house; Wickham, the mansion of the bishops of London, no longer stands. New Hall, which was successively occupied by Henry VIII., Elizabeth, the earl of Essex, George Villiers, duke of Buckingham, and Cromwell, is now a nunnery of the order of the Holy Sepulchre. Audley End, the mansion of Lord Braybrooke, is a noble example of the domestic architecture of the Jacobean period; Laven Marney is an interesting proof of the Italian influences that were at work in the time of Wosley. Hereham Hall was built by Sir John Cutt in the reign of Henry VII., and Gosfield Hall is of about the same date.

ESSEX, KINGDOM OF, one of the kingdoms into which Anglo-Saxon Britain was divided, properly the land of the East Saxons. Of its origin and early history we have no record except the bare statement of Bede that its settlers were of the Old Saxon race. In connexion with this it is interesting to notice that the East Saxon dynasty claimed descent from Seaxneat, not Woden. The form Seaxneat is identical with Saxnot, one of three gods mentioned in a short continentalProbable name of Old Saxon origin. Bede does not mention this kingdom in his narrative until 604, the year of the consecration of Mellitus to the see of London. The boundaries of Essex were in later times the rivers Stour and Thames, but the original limits of the kingdom are quite uncertain. Some authorities have been inclined to make it the whole of Hertfordshire, and in the 7th century the whole of Middlesex. In 604 we find Essex in close dependence upon Kent, being ruled by Sæberht, sister's son of Æthelberht, under whom the East Saxons received Christianity. The three sons of Sæberht, however, expelled Mellitus from his see, and even after their death in battle against the West Saxons, Eadbald of Kent was unable to restore him. In the year 653 we find Northumbrian influence paramount in Essex, for King Sigeberht at the instance of Osric became a Christian and received Cedd, the brother of St Chad, in his kingdom as bishop, Tilbury and T[h]anceasterre (on the Blackwater) being the chief scenes of his work. Swithhelm, the successor of Sigeberht, was on terms of friendship with the East Anglian royal house, King Erewhald of the Angles, and, as a supporter of Cedd, died about this time that Erconwald, afterwards bishop of London, founded the monastery of Barking. Swithhelm's successors Sigehere and Sebbe were dependent on Wulfhere, the powerful king of Mercia, who on the apostasy of Sigehere sent Bishop Jaruman to restore the faith. There are grounds for believing that an East Saxo conquest of Kent took place in this reign. A forged grant of Ceadwalla speaks of the fall of Kent before Sigehere as a well-known event; and in a Kentish charter dated 676 a king of Kent called Swithbald grants land with the consent of his father King Sebbe. In 692 or 694 Sebbe abdicated and received the monastic vows from Wulfhere, the successor of Erconwald at London. His sons Sigeheard and Swefred succeeded him as kings of Essex, Sigeheard being apparently dead. As the laws of Ine of Wessex speak of Erconwald as "my bishop," it is possible that the influence of Wessex for a short time prevailed in Essex; but a subsequent charter of Swefred, dated by Coenred of Mercia and Offa, and bearing the king's name, accompanied the same king to Rome in 709. From this time onwards the history of Essex is almost a blank. In 743 or 745 Æthelbald of Mercia is found granting privileges at the port of London, and perhaps the western portion of the kingdom had already been annexed, for henceforward London is frequently the meeting-place of the Mercian council. The violent death of Seled, king of Essex, is mentioned in the Saxons Chronicle under the year 746; but we have no more information of his reign. The late 8th century marks the end of the old kingdom, for the two last known names of sons of Sebbe; Swebriht (d. 738); Selered (d. 746); Swithhelm, grandson of Sigeheard (suc. 746); Sigeric, son of Selered (abd. 798); Sigred, son of Sigeric (reigning in 823).

ESSLINGEN, a town of Germany, in the kingdom of Württemberg, in a fertile district on the Neckar, 9 m. S.E. from Stuttgart, on the railway to Ulm. Pop. (1905) 29,750. It is surrounded by medieval walls with towers and bastions, and has thirteen suburbs, one lying on an island in the river. On a commanding height above the town lies the old citadel. The inner town has an old (1430) and a new Rathaus, the latter, formerly a palace, being his chapel at his baptism. The church of the Lady (Frauenkirche) is a fine Gothic building of the 15th century, and has a beautifully sculptured doorway and a lattice spire 240 ft. high. The church of St Dionysius dated from the 13th century, and possesses a fine screen and a ciborium of 1486. Esslingen possesses several schools, a theatre and a richly endowed hospital, while its municipal archives contain much valuable literature bearing especially on the period of the Reformation. The town
has railway, machine and electrical works; cloth, gloves and buttons are also manufactured here, and there are spinning-mills.

"The most important factor in Esselingen's commercial life is its wine. The city is famous for its wine, which is exported to many countries."

Essligen, which dates from the 8th century, became a town in 886. It was soon a place of importance; it became a free imperial city in 1300 and was surrounded with walls by order of the emperor Frederick II. Its liberty was frequently threatened by the rulers of Württemberg, but it did not become part of that country until 1802.

See K. H. S. Pfaff, Geschichte der Reichsstadt Esslingen (Esslingen, 1892); and Strömholme, Esslingen in Wort und Bild (Esslingen, 1902).

**Establishment** (O. Fr. establissement, Fr. establissement, Latin stabilitas; to make stable), generally the act of establishing or fact of being established, and so by transference a thing established. Thus we may speak of the establishment (i.e. setting up) of a business, the "long establishment" of a business, and of the agent of the establishment. In a special sense the word is applied, with something of all the three above-mentioned connotations, to certain religious bodies in their relation to the state. It is with this latter that the present article is concerned.

Perhaps the best definition which can be given, and which will cover all cases, is that establishment implies the existence of some definite and distinctive relation between the state and a religious society or corporation. Thus, the word has reference to the character of the society which is shared by other societies of the same general character. Of course, a certain relationship must exist between the state and every society, religious or secular, by virtue of the sovereignty of the state over each and all of its members. Every society must possess certain principles or perform certain acts, and the state may make the profession of such principles unlawful, or impose a penalty upon the performance of such acts; and, moreover, every society is liable before the law to the fulfilment of its obligations towards its members and the due administration of its property should it possess any. With all this establishment has nothing to do. It is not concerned with what pertains to the religious society qua society, or with what is common to all religious societies, but with what is exceptional. It denotes any special connexion with the state, or privileges and responsibilities possessed by the law, possessed by one religious society to the exclusion of other societies of the same name, or even of a word, of the nature of a monopoly. But it does not imply merely privilege. The state and the Church have mutual obligations towards each other; and the Church accepts these responsibilities for the advantages which accrue to itself. The state does so in view of what it believes to be the good of all its members; for "the true end for which religion is established is not to provide for the true faith, but for civil utility" (Warburton), even if the latter be held to be implied in the former. On the other hand, the Church accepts these responsibilities for the facilities which they involve, i.e. for its own benefit. It will be seen that this definition excludes, and rightly, many current presuppositions. Establishment affirms the fact, but does not determine the precise nature, of the connexion between the state and the religious society. It does not tell us, for example, when, or how it began, or whether it is the result of an unconscious growth (as with the Gallican Church previous to the French Revolution), or of a determinate legislative act (as with the same Church re-established by the Concordat of 1801). It does not tell us whether an endowment of the religious society by the state is included; what particular privileges are enjoyed by the religious society; and what limitations are placed upon the free exercise of its life. These things can only be ascertained by actual inquiry; for the conditions are precisely similar in no two cases.

To proceed to details. At the present day there is no established religion in the United States, the German empire as a whole, Holland, Belgium, France and Austria-Hungary (saving, indeed, "the rights of the sovereign arising from ecclesiastical dignity"), whereas there are religious establishments in Hungary, Greece, Sweden, Norway, Denmark, Prussia, Spain, Portugal and even in Italy, as well as in England and Scotland. These, however, differ greatly amongst themselves. In Russia the "Orthodox Catholic Eastern" is the state religion. The emperor is, by the fundamental laws of the empire, "the sovereign defender and protector of the dogmas of the dominant faith, who maintains orthodoxy and holy discipline within the Church," although, of course, he cannot modify either its dogmas or its outward order. Further, "he is also an imperial sovereign, acts in the ecclesiastical administration by means of the Most Holy Ruling Synod, created by it," and all the officers of the Church are appointed by it. The enactments of the Synod do not become law till they have received the emperor's sanction, and are then published, not in its name but in his, and a large part of the revenues of the Church is derived from state subsidies. In Greece "the dominant religion ("ta ἡγεμονικὰ λατρείαν") is that of the Eastern Orthodox Church of Christ," and although toleration is otherwise complete, no proselytism from the Church of Greece is allowed. The king swears to protect it, but no powers pertain to him with regard to it such as those which the tsar enjoys; the present king is not a member of it, but his successors must be. In Sweden, Lutheranism was adopted as the state religion by the synod of Upsala (Upoalæ möte) in 1536, and the king must profess it. The "Lutheran Protestant Church" retains an episopal order, and is supported out of its own revenues. Archbishops and bishops are chosen by the king out of those names submitted to him, and he also nominates to royal peculiar. The ecclesiastical law (Kykolagia), first established in 1686, is part of the law of the state, but may not be modified or abrogated without consent of a General Synod; and although ad interim interpretations of that law may be given by the king on the advice of the Supreme Court, since 1866 these have been subject to review and rejection in the General Assembly. The National Lutheran ("Högskapelse") is the "official religion," but the Church is supported by the state, its property having been secularized. It is also, more subject to the king, who by the constitution is to "regulate all that concerns divine service and the clergy," and to see that the prescribed order is carried out. It is much the same in Denmark, where, however, the "Evangelical-Lutheran Church" has since the fundamental constitutional law of the 3rd of June 1849 been officially described as the National Church (Statskirke) instead of the State Church (Statskirche) as formerly, and the constitution provides for its regulation by further legislation, which has not yet been passed. For Prussia, see under that heading; it need only be added that self-government still tends to increase, but that the emperor William II. has exercised his office as summus episcopus more freely than most of his predecessors. In Spain the "Catholic, Apostolic and Roman" religion is that of the state, "the nation binds itself to maintain its worship and its ministers," and the rites of any other religion are only permitted in private. The patriarch of the Indies and the archbishops are senators by right, and the king may nominate others from amongst the bishops; only laymen may sit in the chamber of deputies. Convents were suppressed, and their property confiscated, in 1835 and 1836; in 1829 the remaining ecclesiastical property was exchanged for untransferable government securities and the support of the clergy of the State Church is assured by an unrevoked law previous to the present constitution.

In Portugal it is much the same, but all the home bishops

---

1 In effect this involves the establishment of all religious denominations, for none can exist without the express authorization of the state, and all are subject to supervision and control in part. Thus the emperor-king is, in his capacity of head of the state, technically "bishop" of the Evangelical Church, the constitution of which was fixed by an imperial patent in 1866 and modified later in 1891 (see Herzog-Hauck, Realencykel, ed. 1904, s. v. "Österreich").—[Ed.]

Also in the other German Protestant states. The relations of the Roman Catholic Church with the various governments are settled by separate concordats with the papacy (see Concordat).
society to be compared with it such a distinctive epithet would have had no point. As, however, there arose religious societies which had no status before the law, it became more natural; and yet more so when the formularies of the Church came to be “established” by civil sanctions (the Books of Common Prayer by 5 and 6 Edw. VI. c. 1, s. 4, &c.; the Articles by 13 Eliz. c. 12; the new Ordinal by 13 and 14 Car. II. c. 4, title). Accordingly the Church itself came to be spoken of as established by law; first, it would seem, in the Canons of 1604, and subsequently in many statutes (Act of Settlement, 6 Anne, c. 8 and c. 11, &c.). In all such cases the Church is described as already established, not as being established by the royal or canon statute. In other words, the constitutional status of the Church is affirmed, but nothing is said as to how it arose.

The legislative changes of the 16th and 17th centuries brought “establishment” into greater prominence and greatly modified its conditions, but a moment’s thought will show that it did not begin then. If, e.g., all post-Reformation ecclesiastical statutes were non-existent, the relations between Church and state would be very different, but there would still be an “establishment.” The bishops would sit in the House of Lords, the clergy would tax themselves in convocation, the Church courts would possess coercive jurisdiction, and so on. The present relations of Church and state in England may be briefly summed up as follows:—

(1) The personal relation of the crown to the Church, including (a) restrictions upon the action of convocation (formulated by 25 Hen. VIII. c. 19; (b) nomination of bishops, &c. (25 Hen. VIII. c. 20); (c) power of supervision as visitor, long disputed (26 Hen. VIII. c. 13; 1 Eliz. c. 1, s. 17); (d) power of receiving appeals as the fount of civil justice (25 Hen. VIII. c. 19, &c.).

In connexion with these, it must be borne in mind that (a) the holder of the crown receives coronation from the church and takes an oath having reference to it (1 Will. III. c. 6), and (b) the crown is held on the condition of communion with the Church of England (Act of Settlement, 6 Anne, c. 8., the conditions of communion are laid down in the Prayer Book, which itself is sanctioned by law).

(2) The relation of the Church to the crown in parliament. No change has been permitted in its doctrine or formularies without the sanction of an act of parliament. (3) Privileges of the Church and clergy. Of these may be mentioned (a) the coercive jurisdiction of the Church courts; (b) the right of bishops to sit in the House of Lords. It need hardly be said that establishment in England does not include an endowment of the Church by the state. Nothing of the kind ever took place on any large scale, and the grants for Church purposes in the 18th century are comparable with the regium donum to Nonconformists.

The position of the Church of Ireland until its disestablishment (see below) was not dissimilar. With Scotland the case is different. The establishment of the Kirk was an entirely new process, carried out by a more or less definite series of legislative and administrative acts. The Convention of Estates which met at Dublin in 1550 ordered the drawing up of a new Cessation of Faith, which was done in four days by a committee of preachers, and on the 24th of August it passed three acts, one abolishing the pope’s authority and all jurisdiction of Catholic prelates, another repealing the old statutes in favour of the Old Church, the third forbidding the celebrating and hearing of mass under penalty of imprisonment, exile and death. The intention was to make a clean sweep of the Old Church, which was denounced as “the Kirk Malignant.” The new model thus set up was confirmed by the Scottish act of 1557, c. 6, which declared it to be “the only true and bale kirk of Jesus Christ within this realme.” Again, after the revolution of 1688 had put an end to the attempts of the Stuart kings to impose the episcopal model on Scotland, by the act of 1690, c. 5, the crown and estates “ratifie and establish the Confession of Faith, . . . as also they do establish, ratifie and confirm the Presbyterian government and church.”

1 Andrew Lang, Hist. of Scotland, ii. p. 75 ff. Compare with this the position of the reformers generally in England, where even so stout a Puritan as William Harrison (Description of England, 1570) was of opinion that the organic life of the Church of England from that of the pre-Reformation Church. (Ed.)
discipline.” The “Act of Security” of 1705, as incorporated in the Act of Union 1706, speaking of it “as now by law established,” says that “Her Majesty . . . doth hereby establish and confirm” it, and finally declares this act, “with the Establishment therein contained, to be "a fundamental and essential condition of the Union.” Nevertheless, the conditions of establishment in the Scottish and English Church are much easier than those of the Church of England. It is bound by the statutes sanctioning its doctrine and order, but within these limits its legislative and judicial freedom is unimpaired. A royal commissioner is present at the meetings of the general assembly, but he need not be a member of the Kirk; and there is no constitutional tie between the crown and the Kirk such as there is in England. There is what may accurately be described as a state endowment, the bulk of the property of the Old Church having been conferred upon the Scottish Kirk.

Not unnaturally the organization of Anglican Churches in the colonies was followed in some cases by their establishment, which included endowment. It was so, for example, in the East and West Indies; and the disestablishment of the West Indian Church in 1868 was followed, in 1873, by a re-establishment of the Church in Barbados by the colonial legislature. India is the only other part of the empire (outside Great Britain) in which there is to-day a religious establishment.

Disestablishment is in theory the annulling of establishment; but since an established Church is usually rich, disestablishment generally includes disendowment, even where there is no state endowment of religion. It is, in short, the abrogation of establishment, coupled with such a confiscation of Church property as the state thinks good in the interests of the community. The disestablishment of the West Indian Church in 1868 has already been referred to; in 1869 the Irish Church Disestablishment Bill was passed. Private bills relating to Scotland have more than once been brought forward. In 1895 the Liberal government introduced a suspensory bill, intended as the preliminary step towards disestablishing and disendowing the Church in Wales; it was withdrawn, however, in the same session, and the question of Welsh disestablishment smoldered until 1905. A royal commission was appointed by the Liberal government to inquire into the subject, and in 1909 a bill was introduced on much the same lines as in 1895.

The case of the Irish Church will illustrate the process of disestablishment, although, of course, the precise details would vary in other cases. The Irish Church Act was passed in 1869 by Gladstone's first government, after considerable opposition, and provided that from January 1, 1871, the union created by statute between the Churches of England and Ireland should be dissolved, and the Church of Ireland should "cease to be established by law." Existing ecclesiastical corporations were dissolved, and their rights ceased, compensation being given to all individuals and their personal precedence being secured for life. All rights of patronage, including those of the crown, were abolished, with compensation in the case of private patrons; and the archbishop and bishops ceased to have the right of summons to the House of Lords. All laws restraining the freedom of action of the Church were repealed; the ecclesiastical law, however, to subsist by way of contract amongst the members of the Church (until altered by a representative body). Provision was made for the incorporation by charter of the representative body of the Church, should such a body be found, with power to hold landed property. All existing ecclesiastical property was vested in a commission, which was to give compensation for life interests, to transfer to the new representative body the endowments, etc., given by the Act; the compensation was to be paid in endowment for private persons since 1860, and to hold the rest for such purposes as parliament might thereafter determine.

ESTABLISHMENT OF A PORT, the technical expression for the time that elapses between the moon's transit across the meridian at new or full moon at a given place and the time of high water at that place. The interval (constant at any one place) may vary from 6 mins. (Harwich) to 11 hrs. 45 mins. (North Foreland). At London Bridge it is 1 hr. 58 mins. (See also Time.)

ESTAING, CHARLES HECTOR, COMTE D' (1729-1794), French admiral, was born at the château de Ruvel, Auvergne, in 1729. He entered the army as a colonel of infantry, and in 1757 he accompanied count de Lally to the East Indies, with the rank of brigadier-general. In 1759 he was made prisoner at the siege of Madras, but was released on parole. Before the ratification of his exchange he obtained command of some vessels, and conducted various naval attacks against the English; and having landed near Corunna to France in 1762, set sail to the Black Sea, and, in the hands of the English, was, on the ground of having broken his parole, thrown into prison at Portsmouth, but as the charge could not be properly substantiated he was soon afterwards released. In 1763 he was named lieutenant-general in the navy, and in 1777 vice-admiral; and in 1778 he obtained the command of a fleet intended to assist the United States against Great Britain. He sailed on the 13th of April, and between the 11th and the 22nd of July, was at St. Vincent, but did not attack him, though greatly superior in force. In concert with the American generals, he planned an attack on Newport, preparatory to which he compelled the British to destroy some war vessels that were in the harbour; but before the concerted attack could take place, he put to sea against the English fleet, under Lord Howe, when owing to a violent storm, which arose suddenly and compelled the two fleets to separate before engaging in battle, many of his vessels were so shattered that he found it necessary to put into Boston for repairs. He then sailed for the West Indies on the 4th of November. After a feeble attempt to retake Santa Lucia from Admiral Barrington, he captured St Vincent and Grenada. On the 6th of July 1779 he fought a drawn battle with Admiral John Byron, who retired to St Christopher. Though superior in force, D'Estaing would not attack the English in the roadstead, but set sail to attack Savannah. All his attempts, as well as those of the Americans, against the town were repulsed with heavy loss, and he was finally compelled to retire. He returned to France in 1780. He was in command of the combined fleet before Cadiz when the peace was signed in 1783; but from that time his chief attention was devoted to politics. In 1787 he was elected to the assembly of the notables; in 1789 he was appointed commandant of the national guard; and in 1792 he was chosen admiral by the National Assembly. Though in favour of national reform he continued to cherish a strong feeling of loyalty to the royal family, and on the trial of Marie Antoinette in 1793 bore testimony in her favour. On this account, and because of certain friendly letters which had passed between him and the queen, he was himself brought to trial, and was executed on the 28th of April 1794.

ESTATE (through O. Fr. estat, mod. état, from Lat. status, state, condition, position, state, to stand), the state or condition in which a man lives, now chiefly used poetically and in such phrases as "man's estate," or "of high estate"; "state" has superseded most of the uses of the word except (1) in property and (2) in constitutional law.
Estate

1. In the law of property the word is employed in several senses. In the widest sense a man’s estate comprises his entire belongings; so much of it as consists of land and certain other interests associated therewith is his “real estate”; the rest is his “personal estate.” The word is more particularly applied to interests in land, and in popular and general use “an estate” means the land itself. The strict technical meaning of “an estate” is an interest in lands, and this conception lies at the root of the English theory of property in land. “The first thing that the student has to do,” says Joshua Williams (Law of Real Property), “is to get rid of the idea of absolute ownership. Such an idea is quite unknown to the English law. No man is in law the absolute owner of lands. He can only hold an estate in them.” That is, the notion of tenure, of holding by a tenant from a lord, prevails. The last lord of all from whom all land was ultimately held was the king. Persons holding directly from the king and granting to others were the king’s tenants in capite, and were the mesne lords of their tenants.

Estates in land may be classified according to (1) the quantity of their interest or duration, (2) the time of enjoyment, and (3) the number and complexion of the tenancies. According to (1), an estate may be either a freehold of inheritance or a freehold not of inheritance. A freehold of inheritance may be (a) an estate in fee simple, which is the largest estate a man can hold in English law, and comes close to the idea of absolute ownership, reserved only by a will; or (b) an estate in fee simple is inheritable by a man’s heirs generally, he has full powers of disposition over it, and may alienate the whole or part. (b) It may also be in limited fees, which are again subdivided into (i) qualified or base fee, (ii) fee conditional, so called at the common law, afterwards, on the passing of the statute De Donis Conditionalibus, fee tail, which may be general as to the heirs of a man’s body, or special, as to the heirs male (or female) of his body. A freehold not of inheritance may be either (1) conventional, as an estate for life, which may be either an estate for one’s own life or for the life of another (par autre vie); (2) legal, or created by operation of law, as tenancy in tail after possibility of issue extinct (i.e., where an estate is given to a man and the heirs of his body by his present wife, and the wife dies without issue, the husband becomes tenant in tail after possibility of issue extinct); tenancy by curtesy (see curtesy); tenancy in dower (see dower).

Estates not of freehold or less than freehold are subdivided into (i.) estates for years (often called estates for a term of years, the instrument creating it being termed a lease or demise, and the estate itself a leasehold interest); (ii.) estates at will, that is, where lands or tenements are let by one man to another to have and to hold at the will of the lessor; (iii.) estates at sufferance, where one comes into possession of land under a lawful title, and continues in possession after his title has determined.

According to (2), estates are either in possession or in expectancy. Estates in expectancy are either (a) in remainder, which may be vested or contingent, or (b) in reversion (see remainder, reversion).

According to (3), estates may be either (i.) in severalty, that is, the holding of an estate by a person in his own right only, without any other person being joined or connected with him in point of interest therein; (ii.) estates in joint tenancy (see joint tenancy); (iii.) estates in common, where two or more hold the same land, by several and distinct titles, but with unity of possession. (See also real property.)

2. In constitutional law an estate is an order or class having a definite share as such in the body politic, and participating either directly or by its representatives in the government. The system of representation by estates took its rise in western Europe during the 11th century, at a time when the feudal system was being broken up through various causes, notably the growing wealth and power of the towns. In the feudal council the clergy and the territorial nobles had alone had a voice; but the 13th century, to quote Stubbins (Const. Hist. ii. 168, ed. 1875), “turns the feudal council into an assembly of estates, and draws the constitution of the third estate from the ancient local machinery which it concentrates.” This is, allowing for differences of detail, true of other countries as well as England. To the two estates already existing, clergy and nobles, is added a third, that of the commons (burgesses and knights of the shire) in England, that of the roivers in France (known as the tiers ducal). This division into three estates became the norm, but it was not universal, nor inevitable.1 Even in England there was a tendency to create other estates, the king for instance treating with the merchants separately for grants of money to be raised by taxing the general body of merchants in the country; and there was a similar tendency on the part of the lawyers. But for the accident of their sitting and voting together, the burgesses and knights of the shire would also have formed separate estates. In Aragon the cortes contained four estates (brasas or arms), the clergy, the great barons (ricos homeres), the minor barons (knights or in maneuver), and the towns. The Swedish diet had also four—clergy, barons, burgheers and peasants.

The system of estates, based on the medieval conception of society as divided into definite orders, formed the basis of whatever constitutional forms survived in Europe till the French Revolution. In England, of course, it had early become obscured, the House of Commons representing the whole nation outside the narrow order of the peers. The creation of an estate of nobles by statute of 1542, and the fusion of the knights of the shire with the burgesses; the spiritual estate was ruled out by the determination of the clergy to deliberate and tax themselves in their own convocation, leaving the bishops, as spiritual peers, to represent their interests in parliament.

The phrase “the three estates of the realm” still survives, but to most men it conveys no clear meaning. The erroneous connection early arose—Hallam says it was current among the popular lawyers of the 17th century—that the “three estates” were king, lords and commons, as representing the three great divisions of legislative authority. Such a conception might be possible in Hungary, where the crown of St Stephen symbolizes not so much the royal power as the co-ordination of the powers of all the organs of the state, including the king; but in England the king represents the whole nation and in no sense a separate interest within it, which is the essence of an estate. The phrase “three estates” as applied to the English constitution as present is, in fact, misleading. It is now usually understood of the lords spiritual, the lords temporal, and the commons.

The conception of the “three estates of the realm” as the great divisions of legislative authority led in England to the coining of the phrase “fourth estate,” to indicate some power of corresponding magnitude in the state distinct from them. Fielding thus spoke of “the mob,” and Hazlitt of Cobbett; but the phrase is now usually applied to the press, a usage originating in a speech by Burke (Carlyle, Hero-worship, Lect. v.).

In the constitutional struggles of the European continent, from the Revolution onward, the rival theories of representation by estates and of popular representation have played a great part. The crucial moment of the French Revolution was when the vote according to “orders” was rejected and the estates of the clergy and nobles were merged with the tiers ducal, the states-general thus becoming the National Assembly. This was the precedent followed by Germany and (to a lesser extent) in the other countries in which constitutional govern-

1 In Scotland the three estates were the prelates, the tenants-in-chief and the burgesses, the third estate joining the others for the first time about the beginning of the 14th century. In 1428 commissions of shires, men elected by the minor tenants-in-chief, were first summoned to appear in parliament; the greater part of the land was coalesced with the prelates and the three estates were the lords, clerical and lay, the commissioners of shires and the burgesses. From 1509 to 1660 parliament was reorganized, the prelates being excluded, but at the Restoration the old order was re-established. The Scottish parliament was accustomed to depute much of its work to a committee, composed of members from each of the three orders, and the commiss of the estate was very prominent during the struggle between Charles I and his people.
ESTATE AND HOUSE AGENTS—ESTATE DUTY

ment was established. In most of them the medieval estates lingered on in provincial diets (Landtage), and the famous Article XIII of the Federal Act (Bundesakte) of Vienna decreed that "assemblies of estates" should be set up, wherever not already existing, in the German states. The efforts of Metternich and the statesmen of his school were directed, not so much to abolishing the constitutional model, as to establishing it, if need be, on traditional and conservative lines. This is what was meant by the famous reply of the emperor Francis I. to the Magyar deputation: "All the world is playing the fool and deceiving itself with constitutions". When the needs for making constitutional concessions became urgent, the attempts were accordingly made to base them on the system of estates. But the central diet convoked in 1847 by Frederick William IV. to Berlin, technically a concentration of provincial estates, quickly converted itself as Metternich had prophesied—into a national assembly; and precisely the same thing happened in the case of the first Austrian parliament in 1848. In Hungary the revolution was in some respects more conservative in character. The March Laws of 1848 preserved the general character of the House of Magnates, comparable to the British House of Lords, but converted the Lower House from what was practically representative of the estate of the lesser nobles into a national representative assembly. Of all the sovereign states of Europe only the grand-duchies of Mecklenburg still (1900) retain the ancient system of estates untouched. The diet, which is common to the two duchies, consists of the Ritterschaft, in which all tenants and lesser nobles (Ritterschaftsinnen), whether noble or not noble, have a voice, and the Landschaft, which consists of the chief magistrates of the towns. The former is taken as representative of the peasant proprietors and copy-holders (H huntersassen), the latter of the burghers.

The plural form Estates of States (Fr. états, Ger. Stände) is the name commonly given to an assembly of estates (assemblée des états, Ständeraussammlung). When such an assembly is not merely local or provincial it is called the estates-general or states-general (états généraux), e.g. in France the assembly of the deputies of the three estates of the realm as distinct from the provincial estates which met periodically in the so-called pays d'états.

For further details about the estates in England and elsewhere see W. Stubbs, Constitutional History, vol. ii. (1860); H. Hallam, The Middle Ages (1856); F. W. Maitland, Constitutional History of England (1908); A. Luchaire, Histoire des institutions monarchiques de la France (1883-1886); G. Walz, Deutsche Verfassungsgeschichte (1891); A. S. Rait, The Scottish Parliament (1901). See also Representation.

ESTATE AND HOUSE AGENTS. A person exercising the calling of a house agent in England is required, under a penalty of £20, to take out yearly a licence upon which £2 is charged as a duty of excuse, unless he is licensed as an auctioneer or appraiser, or is an agent employed in the management of landed estates, or a solicitor or conveyancer who has taken out his annual certificate as such. In this connexion a person is deemed to be a house agent if he advertises for sale or for letting, or in any way negotiates for the selling or letting of any furnished house or part of any furnished house (any storey or flat rated and let as a separate tenement being for this purpose a house); subject, however, to the qualification that no one is to be deemed to be a house agent by reason of his letting, or offering to let, or in any way negotiating for the letting of, any house the annual rent or value of which does not exceed £5.

A house agent who is merely instructed to act in the usual way of his calling has no authority to bind his employer by a contract. His business is to endeavour to find a person willing to become a purchaser or tenant and then to communicate his offer to the owner. Unless express authority is given to the agent to sell or let, and for that purpose into a binding contract, the principal reserves his right to accept or refuse the offer. The rule that the house or estate agent has authority to receive payment on behalf of the principal. Where he is em-

1 These diets are, wherever they still exist, survivals of the "parliaments" of separate territorial units.

ployed to procure a tenant, he must use reasonable diligence to ascertain that the person to whom the property is let through his agency is fit to be a tenant. He does not, however, in any way guarantee the payment of the rent. A house agent may not, for or in expectation of payment, prepare any deed relating to the sale or letting of real or personal estate. There is, however, no similar prohibition as to agreements not under seal, and it is a common practice for house agents to charge for the preparation of them.

House agents are usually remunerated by way of commission. The scale adopted by the Institute of Estate and House Agents embraces the rates usually charged. In the absence of express provision upon the subject between the principal and the agent, commission is payable only when the latter has found a purchaser or tenant. If, however, he had found a person willing to buy or take property upon the terms upon which the principal intimated to him his willingness to sell or let it, the principal will be liable to pay the amount of the commission, even though in fact he refuses or is unable to sell or let it. Where the agent can show that he has brought about a sale or tenancy he will be entitled to the commission notwithstanding the fact that another agent has been paid, or has recovered in an action, commission in respect of the same sale or tenancy. The agent's authority may be revoked at any time; but, where he has already performed the service for which he was employed, the principal cannot defeat his right to be paid the amount of the commission by subsequently revoking his authority. If the agent is unsuccessful in finding a purchaser or tenant, as the case may be, he will not, as a rule, have any right to remuneration for his efforts in the matter.

Most auctioneers, in addition to holding auctions, carry on the business of house and estate agency. The number of licences issued to house agents and appraisers in England for the year ended 31st March 1899 was 4429, and for the year ended 31st March 1900, 4618. The number of licences issued to auctioneers in England for the corresponding periods was 6399 and 693 respectively.

ESTATE DUTY. For purposes of the national revenue in the United Kingdom, the Finance Act 1894 imposed on all property passing by death after the 1st of August 1894 a duty called estate duty, in lieu of certain other duties previously payable. The objects of the act were—(1) simplification of the death duties and equalization as between real and personal estate, and (2) segregation of all the property passing on a death, and taxation at rates graduated according to the value of the whole. Before the act a duty (probate duty) was taken on the free personal property of deceased persons in the hands of the executor or administrator, without regard to the subsequent distribution. The legacy and succession duties were levied on distribution of the property passing on the death, from the persons taking any property under the will or intestacy of the deceased, or under settlement, or by devolution of title on his death. These two latter duties were mutually exclusive, and together covered practically all property passing by death. They were levied at rates graduated according to consanguinity. In 1888 an attempt was made to equalize the rates of the death duties as between property which paid the probate and legacy duties, and property which paid succession duty only. But the Finance Act 1894 replaced the probate duty by a duty extending to all property real or personal passing on or by reference to death, whether by disposition of the deceased or not, without regard to its tenure or destination. The Finance Acts of 1907 and 1909-1910 increased the scale of duties laid down in 1894.

For this purpose all property passing on a death is aggregated to form one estate, on the capital value of which the duty is charged, at rates graduated from 1 to 1.5% according to the aggregate value. Besides the property of which the deceased was competent to dispose at his death, the aggregated estate includes property in which he had an interest ceasing on his death, from the cesser of which a benefit accrues, or which was disposed of by him within twelve months of death, or at any time, with reservation of an interest to himself. The extent to
which property is deemed to pass on the cesser of a limited interest is measured by the proportion of the income to which the interest extended, without regard to the tenure of the deceased or his successor. Property may therefore be included in the aggregate estate at its capital value owing to the passing of a life-interest only, the property being settled so that the absolute ownership does not pass at all. But when the duty has once been paid on property passing under a settlement, the property does not again become chargeable until it passes on the death of the person who is or has been competent to administer it.
